APPENDIX A: UPDATED WETLAND AND WATERCOURSE REPORT

APPENDIX B: UPDATED ARCHEOLOGICAL REPORT

1 Introduction

On Feb 18, 2020, an Environmental Impact Assessment (EIA) for the Burchill Wind Project (BWP or Project) was registered by the province. The EIA for the Project was submitted by Natural Forces Development Limited Partnership.

The Project proposed a 5-10 turbine wind farm within the boundaries of the City of Saint John that would produce between 20-42 MW of wind energy. Since the submission of the EIA, Natural Forces has confirmed that the Project Size will be set at 42MW therefore requiring 10 turbines. This addendum addresses the updated wetland, watercourse, vegetation and archaeological surveys that have been conducted since the original EIA submission. The Proponent will adhere to the mitigation measures for potential impacts described in section 5 of the original EIA submission. Below, a short overview of wetland, watercourse, rare plant and archeological surveys are provided. Detailed reports are provided in Appendices A and B.

This addendum is submitted by Natural Forces Development Limited Partnership. It is meant to be read in conjunction with the BWP registration EIA document, and the associated addendums submitted on April 15th and September2nd, 2020.

2 Watercourse Surveys

2.1 Field assessment summary

Depth to bedrock across the Project lands is typically only a few centimetres below the surface and the soils atop the bedrock are poorly drained clays. As a result, many watercourses are present on the lands. Watercourses were delineated in the field between 19 August 2019 and 15 October 2019 and between 31 July 2020 and 10 September 2020.

Three additional watercourses were identified in the 2020 surveys. Overall, 77 watercourses were identified and delineated within the survey area (Figure 2.1). Most of the watercourses delineated are ephemeral and likely do not support fish and / or fish habitat. Other than Burchill's Brook (BB), Frenchman's Creek (FC), Mill Creek (MC), and Marsh Brook (MB), the only watercourse delineated in the field where fish were observed was Maguires Cove Brook (MCB). Several brook trout (Salvelinus fontinalis) were observed in pools below the outlet from the wetland connected to MCB.

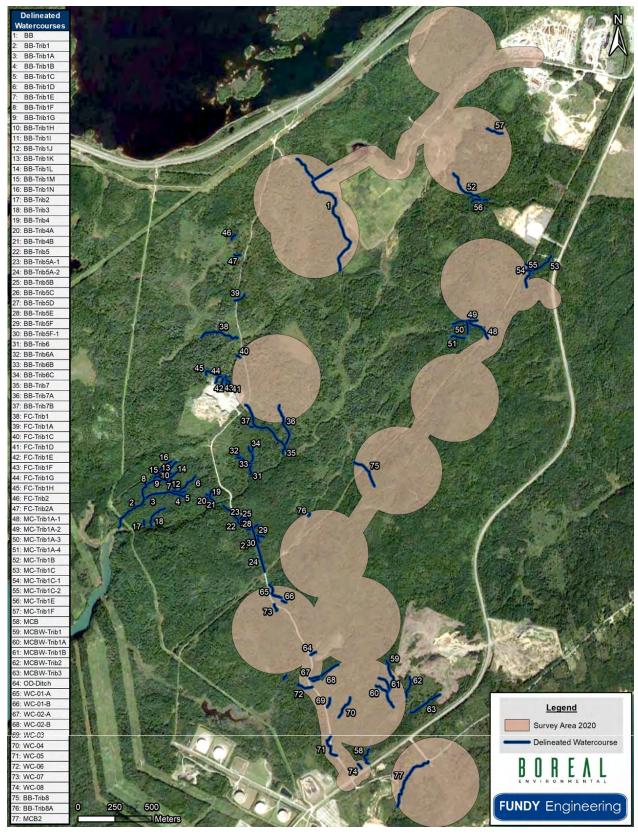

Figure 2-1. Watercourses delineated in the field within the survey area on the lands in west Saint John, New Brunswick being considered for the Burchill Wind Project.

3 Rare Plant Surveys

3.1 Field assessment summary

A vegetation survey was conducted across the Project site between 10 June 2019 and 15 October 2019 and between 31 July 2020 and 10 September 2020 to determine the presence and locations of any rare plant species and rare vegetation communities. All told, 297 plant species were identified on the property. According to ACCDC databases, five of those species are considered rare:

- purple false foxglove (Agalinis purpurea);
- coastal sedge (Carex exilis);
- Wiegand's sedge (Carex wiegandii);
- Loesel's twayblade (Liparis loeselii); and
- cloudberry (Rubus chamaemorus).

The only species considered as May Be At Risk is purple false foxglove. Locally, it appears to be flourishing in disturbed areas across the property, such as along the pipeline right-of-way, all-terrain vehicle trails, and the sides of Burchill Road. The other four species are considered secure. The location and population density of these species are shown in Figure 3.1.

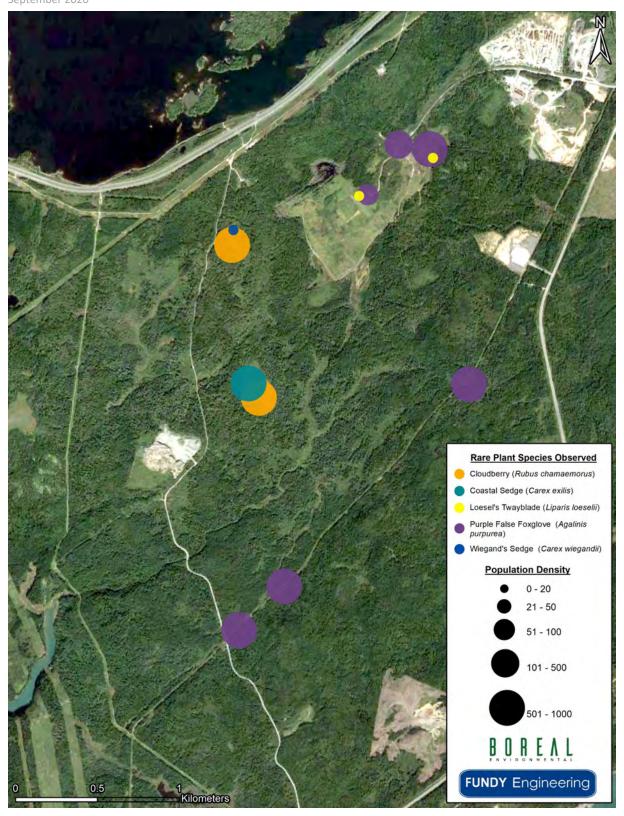

Figure 3-1. Location and population density of rare plants observed on the lands in west Saint John, New Brunswick being considered for the Burchill Wind Project.

4 Wetland Surveys

4.1 Field assessment summary

Wetlands were delineated in the field between 19 August 2019 and 15 October 2019 and between 31 July 2020 and 10 September 2020. These wetlands are shown in Figure 4.1.

4.1.1 Small wetlands

For this Project, wetlands < 0.5 ha in size are considered small wetlands. Detailed paired point analyses (i.e., upland versus wetland) and WFAs were not completed for small wetlands. Instead, information gathered from the large nearby wetlands (i.e., \geq 0.5 ha) were used for delineating the wetland boundaries.

A total of 39 small wetlands with a total area of 6.01 ha were delineated within the study area Overall, there is a fairly even mix of small tall shrub swamps and coniferous swamps located within the study area.

4.1.2 Large wetlands

38 large (i.e., ≥0.5 ha in size) and / or distinctive wetlands (i.e., those <0.5 ha in size, but displayed some noteworthy feature in the field, such as being the source of a perennial tributary, being located in a highly disturbed area, etc., with a combined area of 108.5 ha were delineated on the Project lands. Wetland functional assessments were completed for the 36wetlands within the study area.

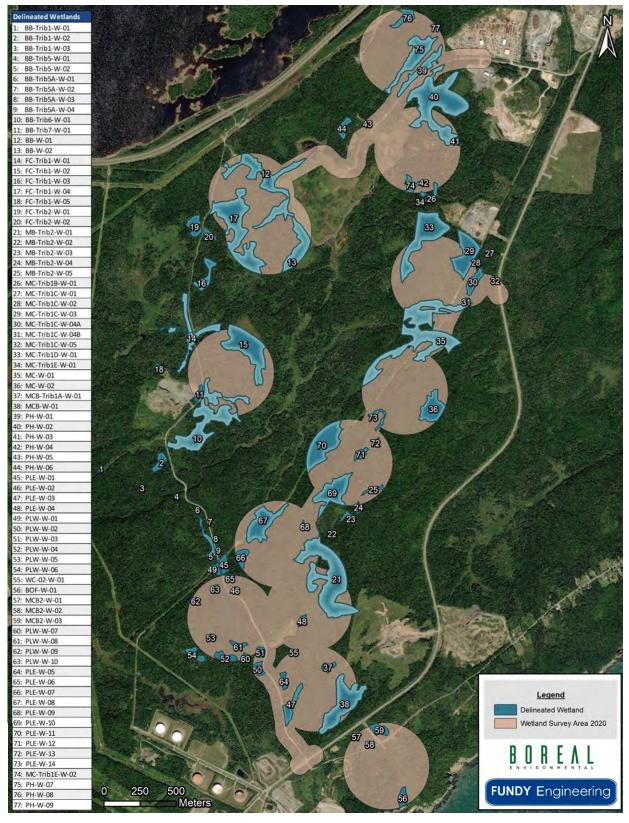

Figure 4-1. Wetlands delineated in the field within the survey area on the lands in west Saint John, New Brunswick being considered for the Burchill Wind Project.

5 Archaeological Surveys

5.1 Pedestrian survey summary

On August 10th & 11th, 2020, an archaeological pedestrian survey took place at a proposed wind farm west of Lorneville, NB. Due to their proximity to the former marine shoreline, Turbines 2e, 5e, 6e, 7e, 8e, 9e, 11e, 12e & 13e should be considered as holding high potential for the presence of early postglacial archaeology. Therefore, anywhere ground disturbing activities (such as removing tree stumps, using heavy equipment, etc.)will occur, archeological test pits will be excavated on a 5m grid following NB Archaeological Service Unit's Guidelines and Procedures for Conducting Professional Archaeological Assessments in New Brunswick (2012), and efforts will be made to minimize the amount of ground disturbing activity.

6 Conclusion

This addendum is meant to be read in conjunction with the registered BWP EIA and previous documents submitted as part of the EIA.

FUNDY Engineering

Serving Our Clients' Needs First

This report was prepared for the sole use of the Client. The material and observations presented reflects Fundy Engineering & Consulting Ltd.'s opinion and best judgment based on the information available. Fundy Engineering & Consulting Ltd. accepts no liability or responsibility whatsoever for or in respect of any use of or reliance upon the material, observations, and / or opinions by any third-party or for any damages suffered by any third-party resulting from the use of this report.

The Watercourse and Wetland Assessment report completed for the Burchill Wind Project was done in partnership with Boreal Environmental. Boreal Environmental conducted the bulk of the field assessments while Fundy Engineering did the majority of the desktop analyses and report writing.

EXECUTIVE SUMMARY

Fundy Engineering & Consulting Ltd. and Boreal Environmental were contracted by Natural Forces to complete watercourse and wetland assessments for the Burchill Wind Project being proposed for west Saint John, New Brunswick. Between 5 and 10 wind turbines are expected to be constructed on the 1 658 ha parcel of Crown land adjacent to the Spruce Lake Industrial Park yielding between 20 MW and 40 MW of electricity to be connected to Saint John Energy's electrical grid.

The scope of work was to: visit the survey area to identify the presence of watercourses, rare plants, and wetlands; ground-truth, or aerially interpret with spot ground-truthing, the flowpaths of watercourses within the survey area; ground-truth, or aerially interpret with spot ground-truthing, the boundaries of wetlands within the survey area; complete wetland functional assessments for wetlands ≥ 0.5 ha; and identify the location and abundance of rare plants within the survey area. The work was completed between 19 August 2019 and 15 October 2019 and between 31 July 2020 and 10 September 2020. within a survey area ~ 390 ha in size.

In addition to wetlands, five general types of habitat were observed across the property. All told, 297plant species were identified on the property. Five rare plants were identified: purple false foxglove (*Agalinis purpurea*); coastal sedge (*Carex exilis*); Wiegand's sedge (*Carex wiegandii*); Loesel's twayblade (*Liparis loeselii*); and cloudberry (*Rubus chamaemorus*). The only species considered as May Be At Risk is purple false foxglove. Locally, it appears to be flourishing in disturbed areas across the property, such as along the pipeline right-of-way, all-terrain vehicle trails, and the sides of Burchill Road. The other four species are considered secure.

Four second order watercourses, Burchill's Brook, Frenchman's Creek, Mill Creek, and Marsh Brook, extend on to the property. Overall, 77 watercourses were identified and delineated on the Project lands. Most of the watercourses are ephemeral and likely do not support fish and / or fish habitat. The watercourses either drain to the Musquash River or the Bay of Fundy.

A total of 39 small wetlands (*i.e.*, < 0.5 ha in size) with a total area of 6.01 ha were delineated on the Project lands. Overall, 38 large (*i.e.*, \geq 0.5 ha in size) and / or distinctive wetlands (*i.e.*, those <0.5 ha in size, but displayed some noteworthy feature in the field, such as being the source of a perennial tributary, being located in a highly disturbed area, *etc.*, with a combined area of 108.5 ha were delineated on the Project lands. Wetland functional assessments were completed for 36 wetlands and results showed 17 ranked as having a higher wetland condition and seven ranked as having a higher wetland risk.

1.0 INTRODUCTION

Fundy Engineering & Consulting Ltd. (Fundy Engineering) was contracted by Natural Forces (*i.e.*, the Client) to complete watercourse and wetland assessments (*i.e.*, the Work) for the Burchill Wind Project being proposed for west Saint John (*i.e.*, Saint John County and the City of Saint John Parish), New Brunswick. Fundy Engineering subcontracted Boreal Environmental (Boreal) to assist with the Work. The property subject of the Work is identified in the New Brunswick Geomatics Information Centre database as Property IDentification (PID) number 00412189 (Figure 1). This report describes the results of the Work completed by Fundy Engineering and Boreal.

1.1 REGULATORY FRAMEWORK

New Brunswick's wetlands and watercourses (i.e., streams) are afforded protection under the Watercourse and Wetland Alteration Regulation [90-80] of the New Brunswick Clean Water Act [S.N.B. 1989, c. C-6.1]. Any proposed alterations within most wetlands and / or streams, or within their 30 m regulated buffer, require permitting through the New Brunswick Department of the Environment and Local Government (NBDELG) Watercourse and Wetlands Alteration (WAWA) Program through a WAWA permit. Any project that has the potential to impact a wetland ≥ 2 hectare (ha) in size, and / or its regulated 30 m buffer, must be registered through the Environmental Impact Assessment Regulation [87-83] of the New Brunswick Clean Environment Act [R.S.N.B. 1973, c. C-6]. New Brunswick's fish-bearing wetlands and watercourses are also afforded protection under Section 35(2) of the Fisheries Act [R.S.C., 1985, c. F-14] administered by the Department of Fisheries and Oceans (DFO), through a Harmful Alteration, Disruption, or Destruction (HADD) of fish habitat authorization. It is the proponent's responsibility to ensure that these features are properly determined through due diligence investigations and that all necessary permits, authorizations, etc. are obtained prior to any impact. Failure to do so could result in fines and remediation if a wetland and / or watercourse is impacted without proper approvals in place.

A *no-net-loss* approach to wetlands, which New Brunswick has adopted, acknowledges that alterations will continue to occur, both naturally and through necessary and beneficial human activities. The approach, which does not consider project economics, applies to all wetlands ≥ 1 ha and strives to preserve wetland functions and values and the benefits that are derived from them. The Federal and Provincial government's wetland preference hierarchy is shown in Figure 2. Avoidance is preferred and is achieved by choosing an alternate project, alternative project design, or alternate development site. Minimization is the reduction of adverse effects of development on wetland functions and values at all project stages to the smallest degree possible and must always be undertaken when impacting a wetland. Compensation, which 'makes up' for unavoidable wetland loss or damage, is required for any and all wetland function and value that is impacted by a project. Wetland compensation ratios are established by the NBDELG. A Wetland Functional Assessment (WFA) may also be required to determine wetland functions, values, and benefits and assess the required compensation ratio.

Figure 1. Aerial photograph showing the location of PID 00412189 in west Saint John, New Brunswick being considered for the Burchill Wind Project.

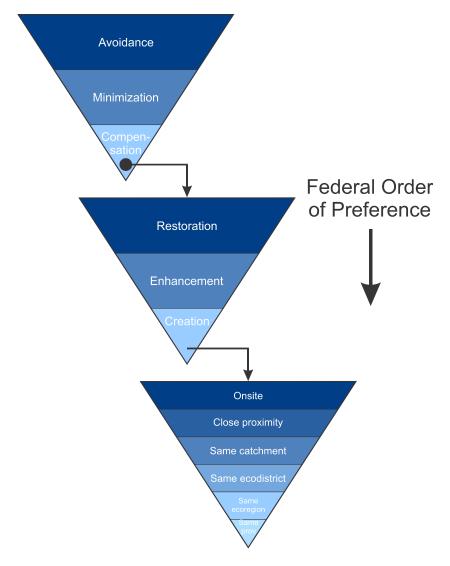

Figure 2. Federal and Provincial Government's preference hierarchy. Based on reports by *Bond et al.* [1992], *Environment Canada* [1996], *Milko* [1998], *Cox and Grose* [2000], and the *Interagency Workshop on Wetland Restoration* [Undated].

1.1.1 Definitions

As defined under the New Brunswick *Clean Water Act* [S.N.B. 1989, c. C-6.1], a watercourse:

means the full width and length, including the bed, banks, sides and shoreline, or any part, of a river, creek, stream, spring, brook, lake, pond, reservoir, canal, ditch or other natural or artificial channel open to the atmosphere, the primary function of which is the conveyance or containment of water whether the flow be continuous or not.

The NBDELG considers watercourses to include any incised channel ≥ 0.5 m wide that displays a rock or soil bed.

As defined under the New Brunswick *Clean Environment Act* [R.S.N.B. 1973, c. C-6], a wetland:

means land that (a) either periodically or permanently, has a water table at, near or above the land's surface or that is saturated with water, and (b) sustains aquatic processes as indicated by the presence of hydric soils, hydrophytic vegetation and biological activities adapted to wet conditions.

1.2 SCOPE OF WORK

The Burchill Wind Project is being proposed for a portion of the 1 658 ha parcel of Crown land adjacent to the Spruce Lake Industrial Park (*i.e.*, PID 00412189; Figure 1). It is expected that 5 to 10 turbines (Figure 3) with a total installed generating capacity between 20 MegaWatts (MW) and 42 MW will be erected at the site and subsequently be connected to Saint John Energy's electrical grid. As per the Environmental Impact Assessment Regulation [87-83] of the New Brunswick *Clean Environment Act* [R.S.N.B. 1973, c. C-6], any wind farm project exceeding 3 MW of installed capacity must undergo EIA review. Part of the assessment of potential environmental impacts of the Burchill Wind Project includes the assessment of watercourses and wetlands.

The scope of work was to:

- visit the survey area to identify the presence of watercourses, rare plants, and wetlands;
- ground-truth, or aerially interpret with spot ground-truthing, the flowpaths of watercourses within the survey area;
- ground-truth, or aerially interpret with spot ground-truthing, the boundaries of wetlands within the survey area;
- complete wetland functional assessments for wetlands ≥ 0.5 ha;
- identify the location and abundance of rare plants within the survey area; and
- generate a report, complete with maps, describing the results of the watercourse delineations, rare plant survey, wetland delineations, and wetland functional assessments.

Figure 3. Aerial photograph showing up to ten turbines on the lands in west Saint John, New Brunswick being considered for the Burchill Wind Project. NOTE: the location of the turbines shown is tentative and subject to change based on wind data analysis and field conditions.

2.0 METHODOLOGY

2.1 WATERCOURSE DELINEATIONS

2.1.1 Desk-Top Assessment

A desk-top assessment of watercourses that may be present at the site is completed by reviewing GeoNB's online maps. The GeoNB database includes watercourses that appear on 1:10 000 scale maps. The watercourses included are those that are on file with the NBDELG and the New Brunswick Department of Natural Resources and Energy Development (NBDNRED). Topographic and LIght Detection And Ranging (LIDAR) maps are also reviewed to determine where potential watercourses may be present on the site.

2.1.2 Field Assessment

Watercourses are delineated in the field by first walking the perimeter of the subject area. Potential watercourses are flagged at that time. Later, the potential watercourses are followed into the subject area to confirm their identification and determine their extent. Generally, location measurements (*i.e.*, latitude and longitude) are made every 5 m to 10 m along the flowpath. Assessment of watercourses includes collecting the following information:

- average width;
- average depth;
- substrate materials:
- flow conditions (i.e., ephemeral or perennial);
- streamside vegetation; and
- fish presence.

2.2 RARE PLANT SURVEY

The Atlantic Canada Conservation Data Centre (ACCDC) maintains a comprehensive list of plant and animal species for New Brunswick. That list includes a conservation status rank and legal status. The conservation status rank is assessed by the ACCDC in collaboration with other experts.

A rare plant survey is done to determine the presence and locations of any rare plant species and rare vegetation communities. Random meander searches are typically conducted throughout a growing season because the best time to identify specific plants varies (*e.g.*, budding stage, flowering stage, moisture conditions, maturity, *etc.*). During the searches, a complete list of vegetation in the area is compiled.

The conservation ranks for species identified in the field are obtained from the ACCDC database. Those ranks are then used to assess the rarity of the species observed. The locations of any rare plants observed in the field are recorded along with their approximate density.

2.3 WETLAND DELINEATIONS

2.3.1 Desk-Top Assessment

A desk-top assessment of wetlands that may be present at the site is completed by reviewing GeoNB's online maps. The GeoNB database includes wetlands that appear on 1:10 000 scale maps. The wetlands included are those that are on file with the NBDELG and the NBDNRED. Topographic and LIDAR maps are also reviewed to determine where potential wetlands may be present on the site.

2.3.2 Field Assessment

Fundy Engineering's process for delineating a wetland boundary is based upon the United States Army Corps of Engineers (USACE) Wetlands Delineation Manual [*Environmental Laboratory*, 1987], the *USACE* [2008] regional supplement, and *Tiner* [1999]. We base our assessments on the New Brunswick *Clean Environment Act* [R.S.N.B. 1973, c. C-6] definition of a wetland (*i.e.*, Section 1.1.1).

We use three criteria for delineating wetland boundaries. Based on this approach, an area is deemed a wetland based on the presence of:

- wetland hydrology;
- wetland hydrophytic vegetation; and
- wetland hydric soils.

The three criteria noted above are not required to be perennially present for an area to be deemed a wetland. For example, wetland hydrology may not exist during a drought or vegetation may not be present if the wetland has been impacted by infilling. The three criteria are discussed in detail below.

2.3.2.1 Hydrology

The *Environmental Laboratory* [1987], defines wetland hydrology as comprising all hydrological characteristics of areas that are periodically inundated or have soils saturated to the surface at some time during the growing season (*i.e.*, the period between the last spring killing frost and the first fall killing frost, which is dependent on local climate and geography).

There are primary and secondary hydrological indicators and areas deemed as wetland should have one primary and two or more secondary indicators present in conjunction with the other two wetland criteria (*i.e.*, wetland hydrophytic vegetation and wetland hydric soils).

Primary indicators of wetland hydrology may include, but are not limited to:

- ponded water;
- saturated soils;
- water marks on woody vegetation, fixed objects, etc.;
- drift lines:

- sediment and debris deposits on the surface, vegetation, etc.; and
- drainage patterns, such as channels, scours, etc.

In addition to the primary indicators, there are a variety of secondary wetland hydrology indicators. Secondary indicators include, but are not limited to:

- oxidized root channels in the upper 30 cm of the soil profile;
- water-stained leaves:
- local soil survey hydrology data;
- the faculative-neutral test of the vegetation as described in detail by Environmental Laboratory [1987]; and
- salt deposits, mud casts, and surface soil cracks.

2.3.2.2 Hydric Soils

Hydric soils are defined as those that formed under conditions of saturation, flooding, or ponding long enough during the growing season to develop anaerobic conditions in the upper part [*USDA-NRCS*, 2003]. Primary indicators of wetland hydric soils may include, but are not limited to, the presence of:

- organic soils (i.e., histosols), such as peats and mucks;
- histic epipedons;
- sulfidic material (i.e., emits an odour of rotten eggs);
- aquic or peraquic moisture regimes (i.e., soils saturated by groundwater);
- reducing conditions;
- soil colours indicative of hydric soils (e.g., gleyed soils, bright mottles, low matrix chroma, etc.);
- iron and manganese concretions;
- high organic matter in the surface horizon;
- streaking of subsurface horizons by organic matter; and
- organic pans.

Hydric soils are assessed in the field by excavating test pits using a shovel. Notes on the soil horizons present and the depth located within the pit(s) are noted. The matrix colour and mottle colour, if present, of the soils are determined using Munsell Soil Colour Charts [Gretag-Macbeth, 2000].

2.3.2.3 Hydrophytic Vegetation

Hydrophytic vegetation is defined as the sum total of macrophytic plant life that occurs in areas where the frequency and duration of inundation or soil saturation produce permanent or periodically saturated soils of sufficient duration to exert a controlling influence on the plant species present [*Environmental Laboratory*, 1987]. Hydrophytic vegetation should be the dominant plant type and is characterized by the dominant species that comprises the plant community.

2.3.2.4 Boundary Delineation

The wetland perimeter is delineated by assessing the relationship between hydrological indicators, hydrophytic vegetation, and hydric soils. Each datum point in the field, spaced about 5 m apart, is collected using a handheld Global Positioning System (GPS) unit with an estimated accuracy rating of ± 3 m.

2.4 WETLAND FUNCTIONAL ASSESSMENTS

For this Work, WFAs were only completed on wetlands ≥ 0.5 ha in size and / or those wetlands considered distinctive.

2.4.1 WESP-AC Model

The NBDELG requires that a WFA be conducted using the Wetland Ecosystem Services Protocol for Atlantic Canada (WESP-AC), which is a standardized method for assessing some of the important natural functions of all types of wetlands in Atlantic Canada. WESP-AC generates normalized scores (*i.e.*, 0 to 10) and ratings (*i.e.*, Lower, Moderate, and Higher) for each function / attribute of a wetland and does so in a consistent and transparent manner. The scores and ratings are used by the Regulator(s) to inform their decisions regarding avoidance, minimization, and replacement.

The, "NB_WESP-AC_Nontidal_Calculator_SingleSite_23July2018_protected.xlsx" model was used for the wetland functional assessments described herein [NBDELG, 2018]. The NonTidal, versus the Tidal, model was chosen because the wetlands are located above the head of tide. The supplementary data contained in Supplnfo_Nontidal_WESP-AC.xlsx file were also used for the assessment.

Non-tidal wetlands are vegetated wetlands that do not experience a fluctuation in their surface water levels at any time of the year as a result of oceanic tides. They are commonly categorized as a swamp, marsh, bog, or fen.

After completing a desk-top assessment and a field assessment, input data are used by the logic models programmed within the WESP-AC Excel® spreadsheets to calculate normalized scores and ratings for each of the wetland attributes summarized in Table 1.

Table 1. Wetland functions and other attributes scored by NonTidal WESP-AC in Atlantic Canada. After *NBDELG* [2018].

Function or Attribute	Definition	Potential Benefits	
Hydrologic Functions			
Water storage and delay	The effectiveness for storing runoff or delaying the downslope movement of surface water for long or short periods	Flood control and maintain ecological systems	
Stream flow support	The effectiveness for contributing water to streams especially during the driest part of a growing season	Support fish and other aquatic life	
Water Quality Maintenance Functions			
Water cooling	The effectiveness for maintaining or reducing temperature of downslope waters	Support coldwater fish and other aquatic life	

Function or Attribute	Definition	Potential Benefits
Sediment retention and stabilization	The effectiveness for intercepting and filtering suspended inorganic sediments, thus allowing their deposition, as well as reducing energy of waves and currents, resisting excessive erosion, and stabilizing underlying sediments or soil	Maintain quality of receiving waters and protect shoreline structures from erosion
Phosphorus retention	The effectiveness for retaining phosphorus for long periods (> 1 growing season)	Maintain quality of receiving waters
Nitrate removal and retention	The effectiveness for retaining particulate nitrate and converting soluble nitrate and ammonium to nitrogen gas while generating little or no nitrous oxide (a potent greenhouse gas)	Maintain quality of receiving waters
Organic nutrient export	The effectiveness for producing and subsequently exporting organic nutrients (mainly carbon), either particulate or dissolved	Support food chains in receiving waters
Ecological Habitat Functions		
Fish habitat	The capacity to support an abundance and diversity of native fish (both anadromous and resident species)	Support recreational and ecological values
Aquatic invertebrate habitat	The capacity to support or contribute to an abundance or diversity of invertebrate animals, which spend all or part of their life cycle underwater or in moist soil and includes dragonflies, midges, clams, snails, water beetles, shrimp, aquatic worms, and others	Support salmon and other aquatic life and maintain regional biodiversity
Amphibian and reptile habitat	The capacity to support or contribute to an abundance or diversity of native frogs, toads, salamanders, and turtles	Maintain regional biodiversity
Waterbird feeding habitat	The capacity to support or contribute to an abundance or diversity of waterbirds that migrate or winter, but do not breed in the region	Support hunting and ecological values and maintain regional biodiversity
Waterbird nesting habitat	The capacity to support or contribute to an abundance or diversity of waterbirds that nest in the region	Maintain regional biodiversity
Songbird, raptor, and mammal habitat	The capacity to support or contribute to an abundance or diversity of native songbird, raptor, and mammal species and functional groups, especially those that are most dependent on wetlands or water	Maintain regional biodiversity
Native plant habitat and pollinator habitat	The capacity to support or contribute to a diversity of native, hydrophytic, vascular plant species, communities, and / or functional groups, as well as the pollinating insects linked to them	Maintain regional biodiversity and food chains
Public use and recognition*	Prior designation of the wetland, by a natural resource or environmental agency, as some type of special protected area; also, the potential and actual use of a wetland for low-intensity outdoor recreation, education, or research	Commercial and social benefits of recreation and protection of prior public investments

NOTES:

^{*}A wetland benefit that is not considered a function

2.4.2 Desk-Top Assessment

A desk-top assessment is completed prior to visiting the wetland. Aerial images and data from various sources, such as Google Earth, are consulted in order to answer 38, mostly multiple-choice, questions about the wetland.

2.4.3 Field Assessment

After the desk-top assessment is completed, the wetland is visited. Field observations and discussions with the landowner(s) are used to answer 66 specific questions related to the wetland. A stressor datasheet is also completed.

2.5 ASSESSORS

Matt Alexander, *Ph.D.*, *P.Geo.*, *EP* and Derrick Mitchell, *B.Sc.F.*, *R.P.F.* completed the watercourse and wetland assessments described herein. Derrick took the WESP-AC training in July 2016 in Fredericton, New Brunswick where the instructor was Dr. Paul Adamus. Matt attended the WESP-AC training session held on 12 and 13 September 2016 in Aulac, New Brunswick where the instructor was Dr. Paul Adamus. Derrick and Matt have both completed hundreds of wetland delineations in New Brunswick, Nova Scotia, and Prince Edward Island.

3.0 SITE DESCRIPTION

3.1 SURVEY AREA

Based on preliminary turbine sighting studies, Natural Forces identified lands where watercourse and wetland surveys were required (*i.e.*, the survey area). Initially, this included the following:

- 30 m buffers along roads required to access turbine sites during construction and operation;
- 30 m buffers along powerline easements;
- 30 m buffers around substations and ancillary equipment; and
- > 150 m buffers around turbine bases.

Following discussions with the Regulatory Authorities (*i.e.*, representatives with the NBDELG, NBDNRED, and the Canadian Wildlife Institute), it was agreed that preliminary 150 m buffers would be surveyed in 2019 and that area would be extended to 300 m, as per the Crown Land Policy, around the proposed turbine bases for the 2020 surveys. Therefore, the 2019 Work involved ground-truthing delineation exercises within the initial survey area and aerial photo interpretation and LIDAR interpretation with spot ground-truthing delineation exercises within the expanded survey area (*i.e.*, from 150 m to 300 m from the turbine bases). Additional ground-truthing delineation exercises were done in 2020 to confirm the aerial interpretation with spot ground-truthing delineation exercises.

Figure 4 shows the 2020 survey areas on the Project lands. The total survey area of lands where ground-truthing delineation exercises were completed is approximately 390 ha.

Figure 4. Aerial photograph showing the survey areas on the lands in west Saint John, New Brunswick being considered for the Burchill Wind Project.

3.2 HABITAT TYPES OBSERVED

The survey area is located in the Fundy Coastal Ecodistrict of the Fundy Coast Ecoregion [Ecosystem Classification Working Group, 2007]. The Fundy Coast Ecoregion spans the entire southern coastline of New Brunswick along the Bay of Fundy from the east side of Passamaquoddy Bay to the east side of Shepody Bay. A mainly coniferous forest, dominated by red spruce, balsam fir, black spruce, white spruce, and tamarack, thrives in the cool, moist climate of the Ecoregion. Cedar is a dominant species in the limestone-derived soils around Saint John. The most common hardwood species include heart-leaved birch, mountain ash, red maple, and some yellow birch. The Fundy Coast Ecoregion also has a rich diversity of wetlands.

In addition to wetlands, five general types of habitat were observed across the Project site. The dominant species observed within each habitat are summarized in Table 2. Photographs are provided in Figure 5 through Figure 13.

Table 2. Habitat types observed, including dominant species, on the lands in west Saint John, New Brunswick being considered for the Burchill Wind Project.

Habitat Type	Stratum	Dominant Species
Type 1 – Shrub land	Trees	No trees
	Shrubs	Green alder, 30%White meadowsweet, 30%Bebb's willow, 25%Shrubby cinquefoil, 5%

4.0 WATERCOURSE DELINEATIONS

4.1 DESK-TOP ASSESSMENT

GeoNB mapping shows four named watercourses within the boundaries of the overall site (Figure 14):

- Burchill's Brook;
- Frenchman's Creek;
- Mill Creek; and
- Marsh Brook.

All are second order watercourses. Burchill's Brook and Frenchman's Creek fall within the Musquash River watershed whereas Mill Creek and Marsh Brook drain directly to the Bay of Fundy. Although not confirmed through field assessments, it is believed that the main stems of all these watercourses are salmonid-bearing and support fish habitat.

There are also several unnamed watercourses that appear within the GeoNB mapping database (Figure 14).

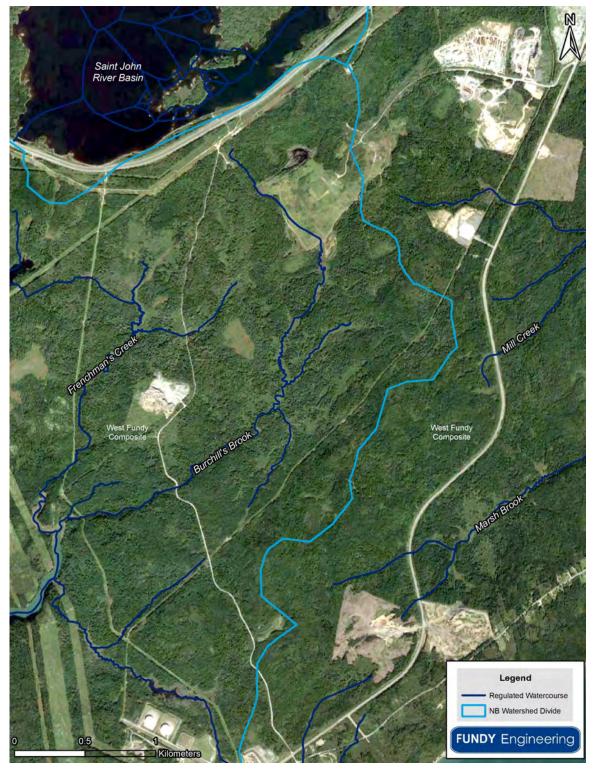

Figure 14. Mapped watercourses present on the lands in west Saint John, New Brunswick being considered for the Burchill Wind Project.

4.2 FIELD ASSESSMENTS

Depth to bedrock across the Project lands is typically only a few centimetres below the surface and the soils atop the bedrock are poorly drained clays. As a result, many watercourses are present on the lands. Watercourses were delineated in the field between 19 August 2019 and 15 October 2019 and between 31 July 2020 and 10 September 2020. Those watercourses are shown in Figure 15 and Table 3 summarizes their characteristics. Photographs of the watercourses are provided in Appendix I, which includes all photographs taken during the field program.

Overall, 77 watercourses were identified and delineated within the survey area. Most of the watercourses delineated are ephemeral and likely do not support fish and / or fish habitat. Other than Burchill's Brook (BB), Frenchman's Creek (FC), Mill Creek (MC), and Marsh Brook (MB), the only watercourse delineated in the field where fish were observed was Maguires Cove Brook (MCB). Several brook trout (Salvelinus fontinalis) were observed in pools below the outlet from the wetland connected to MCB.

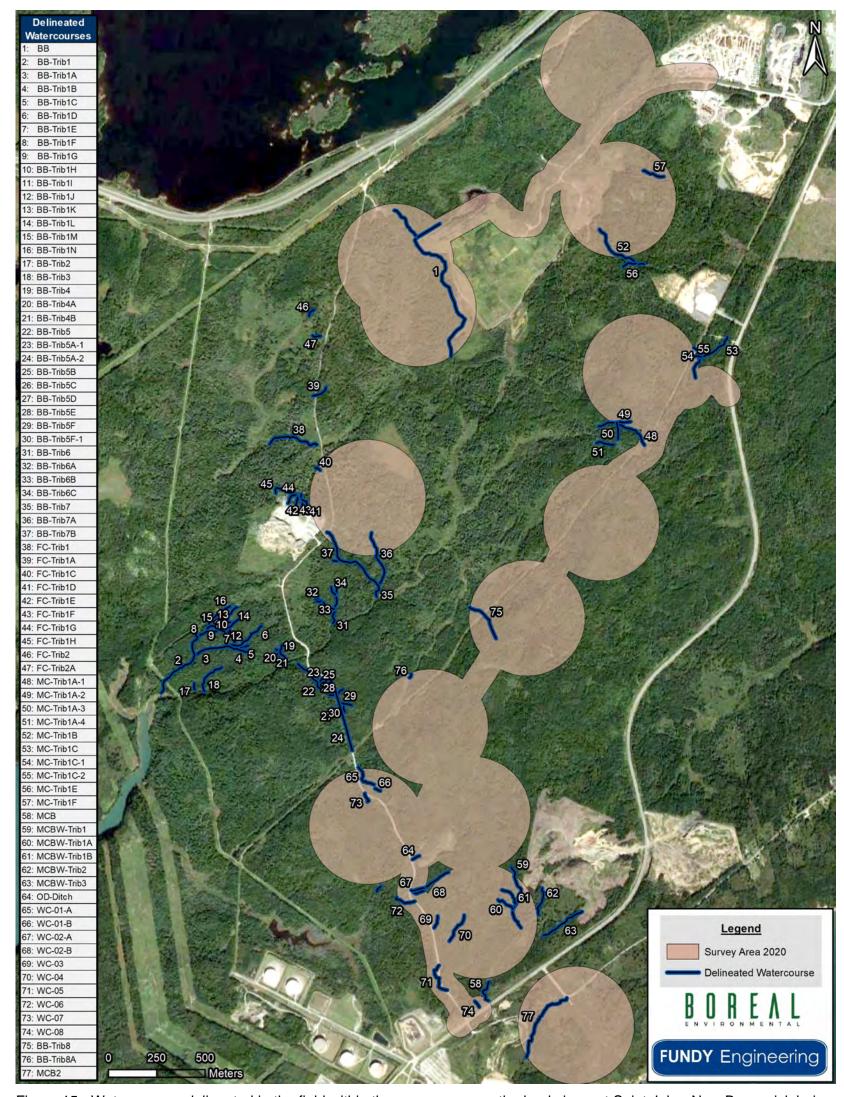

Figure 15. Watercourses delineated in the field within the survey area on the lands in west Saint John, New Brunswick being considered for the Burchill Wind Project.

Table 3. Characteristics of the watercourses identified within the survey area on the lands in west Saint John, New Brunswick being considered for the Burchill Wind Project.

Map ID	Unique ID	Width (cm)	Depth (cm)	Substrate	Flow	Streamside Vegetation	Fish Presence (Observed / Possible / Unlikely)	Comments

4.2.1 Burchill Road Culvert Locations

Noticeable culverts below Burchill Road were recorded during the 2019 field assessments. A summary of those culverts is provided in Table 4.

Table 4. Summary of culverts observed below Burchill Road in west Saint John, New Brunswick.

Culvert	Inside diameter (mm)	Material	Latitude	Longitude	Comments
1	450	Concrete	45°10'27.34"N	66°12'22.73"W	
2	450	Concrete	45°10'29.72"N	66°12'23.68"W	
3	450	Concrete	45°10'32.30"N	66°12'25.40"W	
4	1 800	Corrugated steel	45°10'36.44"N	66°12'30.51"W	Conveys mainstem of Burchill's Brook
5	310	Concrete	45°10'56.95"N	66°12'25.63"W	Considerably undersized
6	450	Concrete	45°11'11.62"N	66°12'27.62"W	Conveys tributary of Frenchman's Creek; likely undersized; full of woody debris

5.0 RARE PLANTS

5.1 FIELD ASSESSMENT

A vegetation survey was conducted across the Project site between 10 June 2019 and 15 October 2019 and between 31 July 2020 and 10 September 2020 to determine the presence and locations of any rare plant species and rare vegetation communities. All told, 297 plant species were identified on the property (Table 5). According to ACCDC databases, five of those species are considered rare:

- purple false foxglove (Agalinis purpurea);
- coastal sedge (Carex exilis);
- Wiegand's sedge (Carex wiegandii);
- Loesel's twayblade (Liparis loeselii); and
- cloudberry (Rubus chamaemorus).

Interpretation of the ACCDC S-rank system is provided in Table 6. Figure 16 shows the general location of the rare plants observed at the Project site and the population density. More detailed information is included in the sections that follow.

Table 5. Flora species observed on the lands in west Saint John, New Brunswick being considered for the Burchill Wind Project. Red shaded entries indicate rare or sensitive species.

Table 6. The Atlantic Canada Conservation Data Centre's Sub-national (*i.e.*, provincial) rarity rank (S-rank) of species and S-rank definitions.

ACCDC S-rank	Definition
S1	Extremely rare: may be especially vulnerable to extirpation; typically five or fewer occurrences or very few remaining individuals.
S2	Rare: may be vulnerable to extirpation due to rarity or other factors; six to 20 occurrences or few remaining individuals.
S3	Uncommon: found only in a restricted range, even if abundant at some locations; 21 to 100 occurrences.
S4	Usually widespread, fairly common: apparently secure with many occurrences, but of longer-term concern (<i>e.g.</i> , watch list); 100 + occurrences.
S5	Abundant: widespread and secure under present conditions.
S#S#	Numeric range rank: a range between two consecutive ranks for a species / community; denotes uncertainty about the exact rarity (<i>e.g.</i> , S1S2).
SH	Historical : previously occurred in the province but may have been overlooked during the past 20 years to 70 years; presence is suspected and will likely be rediscovered.
SU	Unrankable: possibly in peril, but status is uncertain; need more information.
SX	Extinct / Extirpated: believed to be extirpated from its former range.
S?	Unranked: not yet ranked.
SA	Accidental: accidental or casual, infrequent, and far outside usual range; includes species (usually birds or butterflies) recorded once or twice or only at very great intervals, hundreds, or even thousands of miles outside their usual range.
SE	Exotic: an exotic established in the province (<i>e.g.</i> , Purple Loosestrife or Coltsfoot); may be native in nearby regions.
SE#	Exotic numeric: an established exotic that has been assigned a rank.
SP	Potential: potentially occurs, but no occurrences have been reported.
SR	Reported: no persuasive documentation (e.g., misidentified specimen).
SRF	Reported falsely: erroneously reported and the error has persisted in the literature.
SZ	Zero: not of practical conservation concern because there are no definable occurrences, although the species is native and appears regularly; an SZ rank is generally used for occasional long distance migrants.

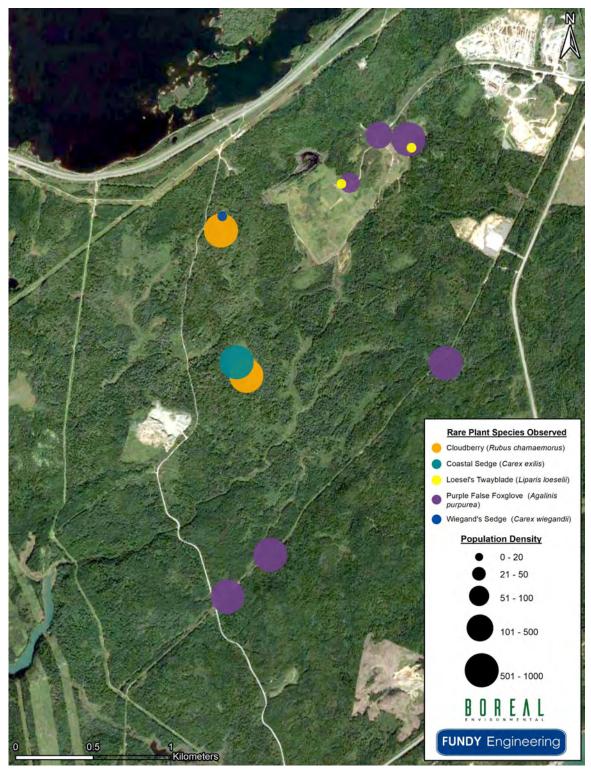

Figure 16. Location and population density of rare plants observed on the lands in west Saint John, New Brunswick being considered for the Burchill Wind Project.

5.1.1 Purple False Foxglove

Agalinis purpurea (Figure 17) is an annual forb native to eastern Canada. In late summer or early fall, the plant, which stands 10 cm to 120 cm tall, produces purple flowers that last about a month. It is hemiparasitic on a variety of hosts, particularly graminoids and appears to thrive in areas with occasional disturbance. According to the ACCDC databases, it is listed as S1 and May Be At Risk in New Brunswick (Table 5).

Purpurea was found at several locations on the property, but mainly in disturbed areas, such as along all-terrain vehicle trails, the pipeline right-of-way, and along the edges of roadways growing up through cracks in the asphalt (Figure 16). Specific locations in the field where observations were made along with approximate densities are provided in Table 7.

Figure 17. Photographs of *Agalinis purpurea* specimens identified on the lands in west Saint John, New Brunswick being considered for the Burchill Wind Project.

45°11'55.90"N	66°11'20.90"W	50+

5.1.2 Coastal Sedge

Several hundred specimens of *Carex exilis* were observed (Figure 18) throughout the bog with central coordinates 45°11'10.01"N and 66°12'10.22"W (Figure 16). This species of sedge is found in open peatlands and patterned fens, which distinguishes it from all other *Carex* species. It blooms in late May through early June and fruiting occurs in early June through late July. The ACCDC lists the coastal sedge as being uncommon but secure in New Brunswick (Table 5).

Figure 18. Photograph of *Carex exilis* specimens identified on the lands in west Saint John, New Brunswick being considered for the Burchill Wind Project.

5.1.3 Wiegand's Sedge

Wiegand's sedge (*Carex wiegandii*) is a grass-like densely clumped sedge found in thin peatlands and bogs and acidic swamps in the shade of conifers or alder thickets. It generally has numerous flowering / fruiting stems 10 cm to 100 cm long with four to six flower / fruit clusters (Figure 19). The ACCDC lists Wiegand's sedge as being uncommon but secure in New Brunswick (Table 5). Three clumps of *wiegandii* were observed at 45°11'41.11"N and 66°12'17.20"W (Figure 16) within a swamp.

Figure 19. Photographs of *Carex wiegandii* specimens identified on the lands in west Saint John, New Brunswick being considered for the Burchill Wind Project.

5.1.4 Loesel's Twayblade

Loesel's twayblade (*Liparis loeselii*) was found in three locations on the property (Table 8; Figure 16). *Loeselii* (Figure 20) is a small (*i.e.*, 15 cm to 20 cm tall) bright yellowish green orchid often overlooked in fens, bogs, and disturbed habitats because of its size. It has two dark green, often glossy, basal leaves that appear in the spring and produces up to 18 small flowers in June and July. The ACCDC lists Loesel's twayblade as being uncommon but secure in New Brunswick (Table 5).

Table 8. Locations of *Liparis loeselii* identified on the lands in west Saint John, New Brunswick being considered for the Burchill Wind Project.

Latitude	Longitude	Approximate Density
45°11'47.77"N	66°11'42.01"W	Nine plants over 1 m ²
45°11'55.27"N	66°11'21.28"W	Seven plants over 10 m ²
45°11'54.90"N	66°11'21.09"W	Three plants over 1 m ²

Figure 20. Photograph of *Liparis loeselii* specimens identified on the lands in west Saint John, New Brunswick being considered for the Burchill Wind Project.

5.1.5 Cloudberry

Cloudberry (*Rubus chamaemorus*) was found throughout the two bogs at the Project site (Figure 16). *Chamaemorus* (Figure 21) is a 10 cm to 25 cm tall rhizomatous herb that produces an amber-coloured edible fruit in the fall similar to raspberries or blackberries. It is typically found in cool boggy places and calcareous soils. The ACCDC lists the cloudberry as being uncommon but secure in New Brunswick (Table 5).

Figure 21. Photograph of *Rubus chamaemorus* identified on the lands in west Saint John, New Brunswick being considered for the Burchill Wind Project.

6.0 WETLAND DELINEATIONS

6.1 DESK-TOP ASSESSMENT

GeoNB mapping shows several large wetlands within the boundaries of the property (Figure 22). Several of the wetlands are contiguous with on-site watercourses, such as Burchill's Brook, Frenchman's Creek, Mill Creek, and Marsh Brook. The wetlands at the mouth of each of those aforementioned watercourses are considered provincially significant because they are tidal wetlands.

6.2 FIELD ASSESSMENTS

Wetlands were delineated in the field between 19 August 2019 and 15 October 2019 and between 31 July 2020 and 10 September 2020. Those wetlands are shown in Figure 23 and summarized in sections below.

6.2.1 Note on Hydric Soils

The soils within the study area are extremely shallow and sit atop bedrock. *Wicklund and Langmaid* [1953] described the soils in the area as Lorneville silty clay loam derived from marine deposits. The Lorneville series comprises red coloured fine-textured soils occurring along the coast. The soils are described as being poorly drained. Water is removed from the soil so slowly that the water table remains at or on the surface for the greater part of the time the soil is not frozen. These conditions are consistent across the site. Because of this, digging test pits and assessing the soils was considered extraordinary considering the landscape. Representatives with the NBDELG and NBDNRED were consulted and agreed that test pitting was not required for soils assessments.

6.2.2 Boundary Delineation

Wetland boundaries were delineated in the field by assessing the relationship between hydrological indicators, hydrophytic vegetation, and hydric soils. Each datum pint in the field was spaced about 5 m to 10 m apart.

Figure 22. Mapped wetlands present on the lands in west Saint John, New Brunswick being considered for the Burchill Wind Project.

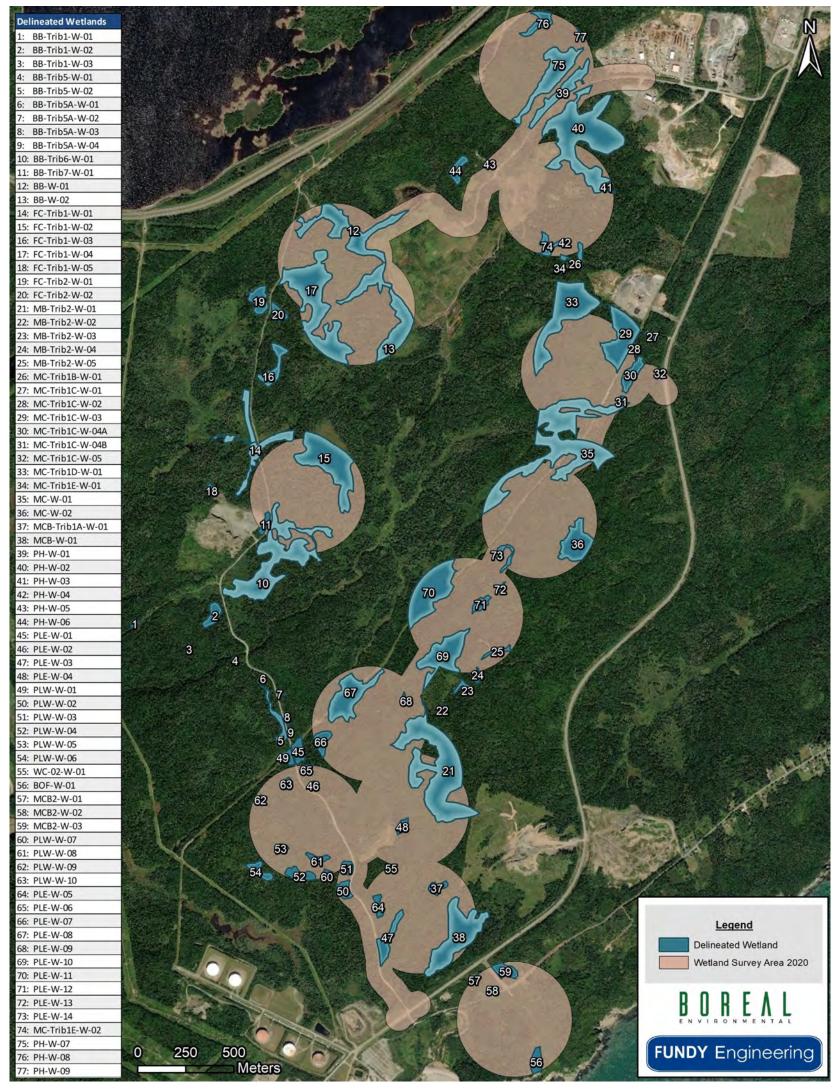

Figure 23. Wetlands delineated in the field within the survey area on the lands in west Saint John, New Brunswick being considered for the Burchill Wind Project.

6.2.3 Small Wetlands

For this Project, wetlands < 0.5 ha in size are considered small wetlands. Detailed paired point analyses (*i.e.*, upland versus wetland) and WFAs were not completed for small wetlands. Instead, information gathered from the large nearby wetlands (*i.e.*, \geq 0.5 ha) were used for delineating the wetland boundaries.

A total of 39 small wetlands with a total area of 6.01 ha were delineated within the study area (Table 9). Overall, there is a fairly even mix of small tall shrub swamps and coniferous swamps located within the study area.

Table 9. Summary of small wetlands (*i.e.*, < 0.5 ha) delineated on the lands in west Saint John, New Brunswick being considered for the Burchill Wind Project.

Map ID	Unique ID*	Classification	Size (ha)
1	BB-Trib1-W-01	Black spruce tall shrub swamp	0.12

6.2.4 Large and / or Distinctive Wetlands

For this Project, wetlands ≥ 0.5 ha in size are considered large wetlands. Distinctive wetlands are those small wetlands (*i.e.*, < 0.5 ha) that displayed some noteworthy feature in the field (*e.g.*, the source of a perennial tributary, located in a highly disturbed area, *etc.*). Detailed paired point analyses (*i.e.*, upland versus wetland) and functional assessments were completed for all large and / or distinctive wetlands and the results are provided below (Table 10).

Overall, 38 large and / or distinctive wetlands with a combined area of 108.5 ha were delineated. Two of the wetlands are located outside of the current project area (i.e., PH-W-06 and PLW-W-06). Therefore, their WFAs are not included in Section 7.0.

Table 10. Summary of large (i.e., > 0.5 ha) and / or distinctive wetlands delineated within the survey area on the lands in west Saint John, New Brunswick being considered for the Burchill Wind Project.

^{*}BB = Burchill's Brook; Trib = Tributary; W = Wetland; FC = Frenchman's Creek; MB = Marsh Brook; MC = Mill Creek; MCB = Maguires Cove Brook; PH = Paddy's Hill; PLE = PipeLine East; PLW = PipeLine West; WC = Watercourse

†Considered distinctive because it is the source of BB-Trib7 and is impacted by activities within the adjacent rock quarry

§During the 2019 delineation season, it was believed that BB-W-01 and BB-W-02 were separate wetlands, but additional delineation during the 2020 season revealed they are one large wetland; however, to avoid confusion with the earlier report, they were kept

separate within this report

[‡]Considered distinctive because it is the source of MC-Trib1B

Considered distinctive because it is located along the pipeline right-of-way and is impacted regularly by all-terrain vehicles

7.0 WETLAND FUNCTIONAL ASSESSMENTS

7.1 WESP-AC MODEL RESULTS

WFAs were completed for 36 wetlands within the survey area (*n.b.*, 38 wetlands are listed, but WFAs for two were not completed as they fall outside of the survey area). The full WESP-AC Model results for the wetlands assessed are included in Appendix II. A summary of the WFA scoring is provided in Table 11. The wetland functions are grouped as follows:

- hydrologic group:
 - water storage and delay;
- water quality support group:
 - sediment retention and stabilization;
 - phosphorous retention;
 - o nitrate removal and retention; and
 - carbon sequestration;
- aquatic support group:
 - streamflow support;
 - aquatic invertebrate habitat;
 - organic nutrient export; and
 - water cooling;
- aquatic habitat group:
 - anadromous fish habitat;
 - resident fish habitat;
 - amphibian and turtle habitat;
 - waterbird feeding habitat; and
 - waterbird nesting habitat;
- transition habitat:
 - o songbird, raptor, and mammal habitat;
 - native plant habitat; and
 - pollinator habitat;
- wetland condition (i.e., wetland ecological condition); and
- wetland risk (i.e., average of sensitivity and stressors).

The WFA results were plotted on a condition risk matrix shown in Figure 24. All of the wetlands assessed, save for two, scored a moderate to higher condition rating. Wetlands with a moderate risk rating were the lowest group. None of the wetlands assessed showed a higher condition rating combined with a higher risk rating. Seven of the assessed wetlands have a higher risk rating and include:

- BB-Trib5-W-02 (i.e., 5);
- BB-Trib7-W-01 (i.e., 11);
- BB-W-01 (i.e., 12);

- > PH-W-01 (*i.e.*, 39);
- > PLE-W-01 (*i.e.*, 45);
- > PLW-W-01 (*i.e.*, 49); and
- > PLW-W-02 (i.e., 50).

Results of the WFAs suggest that those wetlands in the survey area that have the highest condition rating have the lowest risk rating whereas those wetlands with the highest risk rating have a moderate condition rating.

Table 11. Summary of wetland functional assessments completed for large (i.e., ≥ 0.5 ha) and / or distinctive wetlands identified within the survey area on the lands in west Saint John, New Brunswick being considered for the Burchill Wind Project.

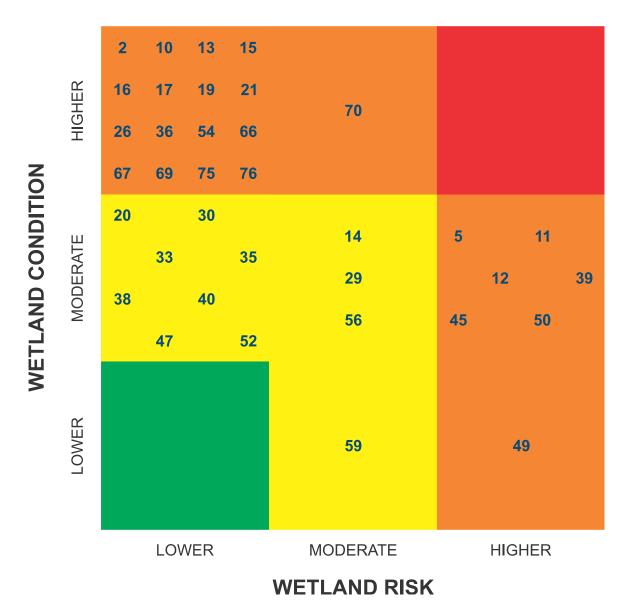

Figure 24. Condition risk assessment for large (i.e., \geq 0.5 ha) and / or distinctive wetlands identified within the survey area on the lands in west Saint John, New Brunswick being considered for the Burchill Wind Project.

8.0 SUMMARY

Watercourse and wetland assessments were completed on portions of PID 00412189 in west Saint John, New Brunswick in support of the Burchill Wind Project being proposed by Natural Forces.

The following is a summary of the findings:

- in addition to wetlands, five general types of habitat were observed across the property;
- all told, 297 plant species were identified on the property;
- five rare species were identified, one of which (i.e., purple false foxglove) May Be At Risk while the other four are considered secure;
- > overall, 77 watercourses were identified and delineated on the Project lands;
- most of the watercourses are ephemeral and likely do not support fish and / or fish habitat:
- ➤ a total of 39 small wetlands (i.e., < 0.5 ha in size) with a total area of 6.01 ha were delineated on the Project lands;
- verall, 38 large (i.e., ≥ 0.5 ha in size) and / or distinctive wetlands with a combined area of 108.5 ha were delineated on the Project lands; and
- wetland functional assessments were completed for 36 wetlands and results showed 17 ranked as having a higher wetland condition and seven ranked as having a higher wetland risk.

8.1 CLOSING

We trust that you will find the contents of this report satisfactory for your purposes. This report was prepared by Dr. Matthew Alexander, *P.Geo., EP* and reviewed by Ms. Crystal Caines, *P.Tech., PMP* and Mr. Derrick Mitchell, *B.Sc.F., R.P.F.* Please feel free to contact the undersigned at 506.674.9422 or via email at matt.alexander@fundyeng.com if any clarification is required.

Respectfully Submitted, FUNDY ENGINEERING & CONSULTING LTD.

Dr. Matthew D. Alexander, P.Geo., EP

10.0 REPORT DISCLAIMERS AND DISCLOSURES

The sole purpose of this report and the associated services performed by Fundy Engineering & Consulting Ltd. was to complete watercourse and wetland assessments in support of an Environmental Impact Assessment for the proposed Burchill Wind Project in west Saint John, New Brunswick. The scope of services was defined at the Project outset between Fundy Engineering and Natural Forces personnel.

The observations made and the facts presented in this report are based on desktop assessments and field assessments conducted during spring, summer, and fall 2019 and summer 2020. Site conditions at the time of visitation / sampling only are reflected in this document. Certain data presented are based on statements, recollections, and observations of various individuals and where this is the case, sources are indicated. No independent confirmation of that information was made.

This report was prepared on behalf of and for the exclusive use of Natural Forces. The report expresses the professional opinion of Fundy Engineering experts and is based on their technical / scientific knowledge. Fundy Engineering & Consulting Ltd. accepts no liability or responsibility whatsoever for or in respect of any use of or reliance upon this report or data by any third-party. Fundy Engineering makes no guarantee that the Client will be successful in the regulatory approval process.

Appendix II:

WESP-AC Model Results

Cover Page: Basic Description of Assessment	WESP-AC version 2
Site Name:	Burchill Wind Energy Project - BB-Trib6-W-01
Investigator Name:	Derrick Mitchell
Date of Field Assessment:	14 October 2019
Nearest Town:	Lorneville (west Saint John), New Brunswick
Latitude (decimal degrees):	45.181083
Longitude (decimal degrees):	-66.206548
Is a map based on a formal on-site wetland delineation available?	Yes
Approximate size of the Assessment Area (AA, in hectares):	7.6
AA as percent of entire wetland (approx.). Attach sketch map if AA is smaller than the entire contiguous wetland.	100
What percent (approx.) of the wetland were you able to visit?	100
What percent (approx.) of the AA were you able to visit?	
Were you able to ask the site owner/manager about any of the questions?	No
Indicate here if you intentionally surveyed for rare plants, calciphile plants, or rare animals	
Have you attended a WESP-AC training session? If so, indicate approximate month & year	Yes, September 2016
How many wetlands have you assessed previously using WESP-AC? (approx.)	100+
Comments about the site or this WESP-AC assessment (attach extra page if desired):	

Form OF (Office). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Conduct an assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the O (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answering many of the questions below will require using these online map viewers:

Google Earth Pro: https://www.google.com/earth/download/gep/agree.html

GeoNB: http://www.snb.ca/geonb1/ and http://www.snb.ca/geonb1/e/apps/apps-E.asp
For most wetlands, completing this office data form will require 1-2 hours. For a list of functions to which each question pertains, see bracketed abbreviations in the Definitions/Explanations column. For detailed descriptions of each WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: NSE water Storage, SSES Stream Flow Support, WC-Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding Waterbird Habitat, WBR= Netroined Habitat, PD= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity

#	Indicators	Condition Choices	Data	Definitions/Explanations
OF1	Province	Mark the province in which the AA is located by changing the 0 in the column next to it to a "1". Mark only one.		This determines to which province's calibration wetlands the raw score of any wetland is normalised.
		New Brunswick	- 1	In the function and benefits models, it also triggers the automatic exclusion of indicators for which no spatial data exists in a particular province.
		Nova Scotia	0	Spatial data exists in a particular province.
		Prince Edward Island	0	
		Newfoundland-Labrador	0	
OF2	Ponded Area Within 1 km.	The area of surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) within 1 km is:		"Adjacent" means not separated from the AA by a wide expanse (>50 m) of upland (including roads >50 m wide). Include ponded areas likely to be hidden by wetland vegetation. If surface water
		<0.01 hectare (about 10 m x 10 m).	1	extends beyond 1 km, include only the part within 1 km. Do not include tidal areas. Measure the are- from aerial imagery using Google Earth Pro (click on Ruler icon in toolbar, then Polygon in pop-up
		0.01 - 0.1 hectare.	0	menu). With the GeoNB viewer, enable the Wetlands layer, then measure with the Draw & Measure
		0.1 - 1 hectare.	0	tool after specifying Aerial as the Basemap. However, do not rely entirely on wetland boundaries
		1 to 10 hectares. 10 to 100 hectares.	0	shown in online wetlands layers. [PH, SBM, WBN]
		>100 hectares.	0	
OF3	Ponded Water & Wetland Within 1 km.	The area of wetlands and surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) within 1 km is:		See definition of adjacent in OF2. If the AA's wetland vegetation extends beyond 1 km, include only the part within 1 km. "Ponded" means not flowing in rivers or streams. [Sens, WBF]
		<0.01 hectare (about 10 m x 10 m).	0	
		0.01 - 0.1 hectare.	0	
		0.1 - 1 hectare.	0	
		1 to 10 hectares.	0	
		10 to 100 hectares.	0	
		>100 hectares.	1	
OF4	Size of Largest Nearby Vegetated Tract or	The largest vegetated patch or corridor that includes the AA's vegetation plus al adjacent upland vegetation that is not lawn, row crops, heavily grazed lands, conifer plantation is:		See definition of adjacent in OF2. Use Google Earth Pro's polygon ruler (as described above). Exclude conifer plantations only if it is obvious that trees were planted in rows. [AM, PH, SBM, Sens]
	Corridor	<0.01 hectare (about 10 m x 10 m).	0	
		0.01 - 0.1 hectare.	0	
		0.1 - 1 hectare.	0	
		1 to 10 hectares.	0	
		10 to 100 hectares.	0	
		100 to 1000 hectares.	0	
OF5	Distance to Large Vegetated Tract	1000 hectares. (This is nearly always the answer in relatively undeveloped landscapes) The minimum distance from theedge of the AA to the edge of the closest vegetated land (but excluding row crops, lawn, conifer plantation) larger than 375 hectares (about 2 km on a side), is:	U	To measure distance, use Google Earth Pro (Ruler > Line tool). Or use Draw & Measure tool at GeoNB. The 375-ha criterion is from the Fundy Model Forest Project. [AM, PH, POL, SBM, Sens]
	g	<50 m, and not separated from the 375-ha vegetated area by any width opaved roads, stretches of open water, row crops, bare ground, lawn, or impervious surface. Or the AA itself contains >375 ha of vegetation. [This is often the answer in relatively undeveloped landscapes	.]	
		<50 m, but completely separated from the 375-ha vegetated area by those features, and AA does not contain >375 ha of vegetation.	0	
		50-500 m, and not separated.	0	
		50-500 m, but separated by those features.	0	
		0.5 - 5 km, and not separated.	0	
		0.5 - 5 km, but separated by those features.	0	
		None of the above (the closest patches or corridors which are that large are >5 km away).	0	
OF6	Herbaceous Uniqueness	The AA's vegetation cover is >10% herbaceous* but uplands within 5 km have <10% herbaceous cover. If so, enter "3" and continue to OF7. If not, consider: The AA's vegetation cover is >10% herbaceous* but uplands within 1 km have <10% herbaceous cover. If so enter "2" and continue to OF7. If not, consider: The AA's vegetation cover is >10% herbaceous* but uplands within 100 m of the wetland edge have <10% herbaceous cover. If so, enter "1". "NOTE: Exclude lawns, row crops, heavily grazed lands, forest, shrublands. Include moss as well as grasslike plants in this use of	0	For this question only, consider moss to be herbaceous vegetation. Determine the score by viewing areal imagery in Google Earth First successively drawing or estimating the boundaries of the buffers of 5 km, 1 km, and 100 m radius focused on the center of the AA. Circles of specified radius can be drawn in Google Earth Pro by clicking on the Ruler icon, then Circle in the pop-up menu. [AMv. PHv. PDLv., SBMv, WBFv, WBNv]
OF7	Woody Uniqueness	"herbaceous vegetation"] The AA's vegetation cover is >10% woody" but uplands within 5 km have <10% woody cover. If so, enter "3" and continue to OF8. If not,	0	See above. Do not consider conifer plantations to be forest if it is obvious that trees were planted in
		consider: The AAS vegetation is >10% woody" but uplands within 1 km have <10% woody cover. If so enter "2" and continue to OF8. If not, consider:		rows. [AMv, PHv, POLv, SBMv]
		The AA's vegetation is >10% woody" but uplands within 100 m of the wetland edge have <10% woody cover. If so, enter "1" [" NOTE: woody cover = trees & shrubs taller than 1 m.]		
OF8	Local Vegetated Cover Percentage	Draw a 5-km radius circle measured from the center of the AA. Ignoring all permanent water in the circle, the percent of the remaining are that is wooded or unmanaged herbaceous vegetation (NOT lawn, row crops, bare or heavily grazed land, clearcuts, or confier plantations) is:		In Google Earth, draw the 5 km buffer and then estimate land cover percentages, or do GIS analysis of an appropriate land cover layer. [AM, PH, POL, SBM, Sens]
		<5% of the land.	0	
		5 to 20% of the land.	0	
		20 to 60% of the land.	0	
		60 to 90% of the land.	0	
		>90% of the land. SKIP to OF10.	1	
OF9	Type of Land Cover	Within the 5-km radius circle, and ignoring all permanent water, the land area that is bare or non-perennial cover is mostly:		[AM, SBM]
	Alteration	Impervious surface, e.g., paved road, parking lot, building, exposed rock.	0	
		Bare pervious surface, e.g., lawn, recent (<5 yrs ago) clearcut, dirt or gravel road, cropland, landslide, conifer plantation.	0	
OF10	Distance by Road to	Measured along the maintained road nearest the AA, the distance to the nearestpopulation center is:		"Population center" means a settled area with more than about 5 regularly- inhabited structures per
	Nearest Population	<100 m.	0	square kilometer. In Google Earth, click on the Ruler icon, then Path, and draw and measure the
	Center	100 - 500 m.	0	route. Or use the GeoNB's Draw & Measure tool> Freehand Line to draw and measure the route to Settlements (click on Place Names in menu) or other areas not close to mapped settlements but
		0.5- 1 km.	0	Settlements (click on Place Names in menu) or other areas not close to mapped settlements but which meet the criteria.[FAv, FRv, NRv, PH, PU, SBM, WBFv]
		1 - 5 km.	1

Form OF Non-tidal

Date: 14 October 2019 Site Identifier: BB-Trib6-W-01 Investigator: Derrick Mitc

Form F (Field). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Walk for no less than 10 minutes from the wetland edge towards its core, in the part of the AA that is proposed for alteration. If no alteration is proposed, walk in a portion that appears to be most representative of the wetland overall. Walk only where it is safe and legal to do so. Conduct the assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answer these questions primarily based on your onsite observations and interpretations. Do not write in shaded parts of this data form. Answering some questions accurately may require conferring with the landowner or other knowledgable persons, and/or reviewing aerial imagery. For most wetlands, completing this field data form will require 1-2 hours on a site. For a list of functions to which each question pertains, see the accompanying Interpretations form. For detailed descriptions of each WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS=Water Storage & Delay, SFS= Stream Flow Support, WC=Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity, STR= Stressors.

#	Indicators	Condition Choices	Data	Definitions/Explanations
F1	Wetland Type	Follow the key below and mark the ONE row that best describes MOST of the vegetated part of the AA:		Ericaceous shrubs are ones in the heather family (Ericaceae). Most have leathery evergreen leaves.
		A. Moss and/or lichen cover more than 25% of the ground. Often dominated by ericaceous shrubs (e.g., Labrador lea) or other acid-lolerant plants (e.g., bog cranberry, pitcher plant, sundew, orchids). Substrate is mostly undecomposed peat. Choose between A1 and A2 and mark the choice with a 1 in their adjoining column. Otherwise go to B below.		They include rhododendron, azalea, swamp laurel, leatherleaf, Labrador tea, and others. Most require acidic soil. Although not in the family Ericaceae, sweetgale (<i>Myrica gale</i>) should be counted also. [AM, CS, FA, FR, INV, NR, OE, PH, Sens, SFS, WBF, WBN]
		A1. Surface water is usually absent or, if present, pH is typically <4.5 and conductivity is usually <100 µS/cm (<64 ppm TDS). Trees are absent or nearly so. Sedge cover usually sparse or absent but cotlongrass and/or lichen cover may be extensive, as well as cloudberry, lingonberry, sheep laurel, and a sedge (Carex rarillora). Welfand surface and surrounding landscape are seldom sloping and welfand often is domed (convex). Inlet and outlet channels are usually absent. If known, pH of peat is <4.0.	0	
		A2. Not A1. Surface water, if present, has pH typically >4.5 and conductivity is usually >100 µS/cm (>64 ppm TDS). Sedge cover is usually extensive, and/or tree and fall shrub cover is extensive. Sometimes at toe of slope or edge of water body. An exit channel is usually present. Wetter than A1 and peat depth may be shallower (<2 m).	0	
		B. Moss and/or lichen cover less than 25% of the ground. Soil is mineral or decomposed organic (muck). Choose between B1 and B2 and mark the choice with a 1 in their adjoining column:		
		B1. Trees and shrubs taller than 1 m comprise more than 25% of the vegetated cover. Surface water is mostly absent or inundates the vegetation only seasonally (e.g., vernal pools or floodplain).	1	
		Regulation for such as full straining (e.g., existing pose of mostposity). B2. Not B1. Tree & fall shrubs comprise less than than 25% of the vegetated cover. Vegetation is mostly herbaceous, e.g., cattail, bufursh, burreed, pond lily, horsetail. Surface water may be extensive and fluctuates seasonally, being either persistent or drying up partly or entirely.	0	
AA shi include " adja e descrii	ould also include part of t e the open water part adj cent " is used synonymou bed features along their o	he AA should include all persistent waters in ponds smaller than 8 hectares (-283 m on a side) that are adjacent to the AA. The the water area of adjacent ponded water larger than 8 ha and adjacent rivers wider than 20 m. Specifically, the AA should acent to wetland vegetation and equal in width to the average width of that vegetated zone. Throughout this data form, usly with abutting, adjoining, bordering, contiguous and means no upland (manmade or natural) completely separates the flirectly shared edge. Features joined only by a channel are not necessarily considered to be adjacent a large portion of their es do not have to be hydrologically connected in order to be considered adjacent.		
F2		If the AA is smaller than 1 ha, mark all other types that occupy more than 1% of the vegetated AA. If the AA is larger than 1 ha, mark all other types which are within or adjacent to the AA and occupy more than 1 ha, as visible from the AA or as interpreted from aerial imagery. Do not mark again the type marked in F1.		1 hectare is 10,000 sq. m or about 2.5 acres. It could have dimensions of 100 m by 100 m, 1000 m by 10 m, or similar. [AM, INV, SBM, WBF]
	Subordinate	DO NOI maix again the type marked in F1. A1.	0	
		A2.	0	
		B1. B2.	0	
F3	Woody Height & Form Diversity	Following EACH row below, indicate with a number code the percentage of the living vegetation in the AA which is occupied by that feature (6 if >95%, 5 if 75-95%, 4 if 50-75%, 3 if 25-50%, 2 if 5-25%, 1 if -5%, 0 if none). If the vegetated part of the AA is largely herbaceous (non-woody) vegetation, these percentages should not sum to 100%.		Deciduous shrubs in this region usually include buttonbush, Labrador tea, bayberry (Morella), huckleberry, cranberry, cloudberry, sweetgale, alder, willow, birch, ash, dogwood, and a few others. If you assigned a code of 3 or higher to any of the first four choices and the ground cover beneath the trees/shrubs is ~25% moss, then question F1 might be "811". [CS, INV, NR, PH, POL, SBM, Sens]
		coniferous trees (may include tamarack) taller than 3 m. deciduous trees taller than 3 m.	5 2	accessinables is \$25.0 moss, and question in impire be bit. [65, inv., inv., in, index, some, some
		coniferous or ericaceous shrubs or trees 1-3 m tall not directly below the canopy of trees.	1	
		deciduous shrubs or trees 1-3 m tall not directly below the canopy of trees. coniferous or ericaceous shrubs <1 m tall not directly below the canopy of taller vegetation.	2	
		deciduous shrubs or trees <1 m tall (e.g., deciduous seedlings) not directly below the canopy of taller vegetation.	2	
Note:	•	F3 was marked 2 or greater, SKIP to F9 (N fixers). Determine which two woody plant species comprise the greatest portion of the low (<3 m) woody cover. Then choose one:		[PH, POL, SBM, Sens]
	Abundant Shrub	those species together comprise > 50% of such cover.	0	i i i i o c, obin, ocioj
	Species	those species together do not comprise > 50% of such cover.	1	
F5	Woody Diameter Classes	Mark ALL the types that comprise >5% of the woody canopy cover in the AA or >5% of the wooded areas (if any) along its upland edge (perimeter). The edge should include only the trees whose canopies extend into the AA.		Estimate the diameters at chest height. If small-diameter trees are overtopped (shaded) by larger ones, visualise a "subcanopy" at the average height of the smaller-dib trees, to serve as a basis for the minimum 5% canopy requirement in this question. The trees and shrubs need not be wetland
		coniferous, 1-9 cm diameter and >1 m tall. broad-leaved deciduous 1-9 cm diameter and >1 m tall.	1	species. [AM, CS, POL, SBM, Sens, WBN]
		coniferous, 10-19 cm diameter.	1	
		broad-leaved deciduous 10-19 cm diameter. coniferous, 20-40 cm diameter.	1	
		broad-leaved deciduous 20-40 cm diameter.	1	
		coniferous, >40 cm diameter. broad-leaved deciduous >40 cm diameter.	1	
F6	Height Class	Follow the key below and mark the ONE row that best describes MOST of the AA:	1	[AM, INV, NR, PH, SBM, Sens]
	Intercorreion	A. Neither the vegetation taller than 1 m nor the vegetation shorter than that comprise >70% of the vegetated part of the AA. They each comprise 30-70%. Choose between A1 and A2 and mark the choice with a 1 in the adjoining column. Otherwise go to B below.		. , , , , , , , , , ,
		A1. The two height classes are mostly scattered and intermixed throughout the AA.	0	
		A2. Not A1. The two height classes are mostly in separate zones or bands, or in proportionately large clumps. B. Either the vegetation shorter than 1 m comprises >70% of the vegetated part of the AA, or the vegetation taller than that does. One size class might even be totally absent. Choose between B1 and B2 and mark the choice with a 1 in the adjoining column:	1	
		B1. The less prevalent height class is mostly scattered and intermixed within the prevalent one. B2. Not B1. The less prevalent height class is mostly located apart from the prevalent one, in separate zones or clumps, or is completely	0	
F7	Large Snags (Dead	absent. The number of large snags (diameter >20 cm) in the AA plus adjacent upland area within 10 m of the wetland edge is:		Snags are dead standing trees that often (not always) lack bark and foliage. Include only ones that are at least 2 m tall. [POL, SBM, WBN]
	Standing Trees)	None, or fewer than 8/ hectare which exceed this diameter.	0	ut reast 2 in tail. [FOL, 3000, WDN]
		Several (>8/hectare) and a pond, lake, or slow-flowing water wider than 10 m is within 1 km. Several (>8/hectare) but above not true.	0	
F8	Downed Wood	The number of downed wood pieces longer than 2 m and with diameter >10 cm, and not persistently submerged, is:		Exclude temporary "burn piles." [AM, INV, POL, SBM]
		Few or none that meet these criteria.	0	
		Several (>5 if AA is >5 hectares, less for smaller AAs) meet these criteria.	1	

FieldF form - Non-tidal Page 1 of 5

F9	N Fixers	The percentage of the AA's vegetated cover that contains nitrogen-fixing plants (e.g., alder, sweetgale, clover, lupine, alfalfa, other legumes)		Do not include N-fixing algae or lichens. [FA, FR, INV, NRv, OE, PH, SBM, Sens]
		is:		3.3
		<1% or none. 1-25% of the vegetated cover, in the AA or along its water edge (whichever has more).	0	
		25-50% of the vegetated cover, in the AA or along its water edge (whichever has more).	0	
		50-75% of the vegetated cover, in the AA or along its water edge (whichever has more).	0	
F40		>75% of the vegetated cover, in the AA or along its water edge (whichever has more).	0	E I I I I I I I I I I I I I I I I I I I
F10	Sphagnum Moss Extent	The cover of Sphagnum moss (or any moss that forms a dense cushion many centimeters thick), including the moss obscured by taller sedges and other plants rooted in it, is:		Exclude moss growing on trees and rocks. [CS, PH]
	Extori	<5% of the vegetated part of the AA.	0	
		5-25% of the vegetated part of the AA.	0	
		25-50% of the vegetated part of the AA. 50-95% of the vegetated part of the AA.	0	
		>95% of the vegetated part of the AA.	0	
F11	% Bare Ground &	Consider the parts of the AA that lack surface water at the driest time of the growing season. Viewed from directly above the ground layer, the		Thatch is dead plant material (stems, leaves) resting on the ground surface. Bare ground that is
	Thatch	predominant condition in those areas at that time is:		present under a tree or shrub canopy should be counted. Boulders count as bare ground. Wetlands with mineral soils and that are heavily shaded or are dominated by annual plant species tend to have
		Little or no (<5%) bare ground is visible between erect stems or under canopy anywhere in the vegetated AA. Ground is extensively blanketed by dense thatch, moss, lichens, graminoids with great stem densities, or plants with ground-hugging foliage.	0	more extensive areas that are bare during the early growing season. [AM, EC, INV, NR, OE, POL, PR SBM, Sens]
		Slightly bare ground (5-20% bare between plants) is visible in places, but those areas comprise less than 5% of the unflooded parts of the	1	
		AA. Much bare ground (20-50% bare between plants) is visible in places, and those areas comprise more than 5% of the unflooded parts of the	0	
		AA.		
		Other conditions.	0	
F12	Ground Irregularity	Not applicable. Surface water (either open or obscured by emergent plants) covers all of the AA all the time. Imagine the AA without any living vegetation. Excluding the portion of the AA that is always under water, the number of hummocks, small pits,	0	The depressions may be of human or natural origin. [AM, EC, INV, NR, PH, POL, PR, SBM, SR, WS]
	, ,	raised mounds, animal burrows, ruts, gullies, natural levees, microdepressions, and other areas of peat or mineral soil that are raised or		
		depressed >10 cm compared to most of the area within a few meters surrounding them is:		
		Few or none (minimal microtopography; <1% of the land has such features, or entire AA is always water-covered). Intermediate.	0	
		Intermediate. Several (extensive micro-topography).	0	
F13	Upland Inclusions	Within the AA, inclusions of upland are:		[AM, NR, SBM]
		Few or none.	0	
		Intermediate (1 - 10% of vegetated part of the AA).	1	
F14	Soil Texture	Many (e.g., wetland-upland "mosaic", >10% of the vegetated AA). In parts of the AA that lack persistent water, the texture of soil in the uppermost layer is mostly: [To determine this, use a trowel to check in at	0	[CS, NR, OE, PH, PR, Sens, SFS, WS]
F14	Soil Texture	in parts of the AA that lack persistent water, the texture of soil in the uppermost layer is mostly: [70 determine this, use a flower to check in at least 3 widely spaced locations, and use the soil texture key (in Appendix A of the Manual).]		[CS, NR, OE, PH, PR, Sells, SFS, WS]
		Loamy: soils that may contain a little fine grit and do not make a "ribbon" longer than 2 cm when moistened, rolled, squeezed, and extended	0	
		between thumb and forefinger.	_	
		Fines: includes silt, clay, silt, soils that make a ribbon longer than 2 cm when moistened, rolled, squeezed, and extended between thumb and forefinger.	0	
		Deep Peat, to 40 cm depth or greater.	1	
		Shallow Peat or organic <40 cm deep. Coarse: includes sand, loamy sand, gravel, cobble, soils that do not make a ribbon when moistened, rolled, squeezed, and extended	0	
		between thumb and forefinger.	Ů	
F15	Shorebird Feeding	During any 2 consecutive weeks of the growing season, the extent of mudflats, bare unshaded saturated areas not covered by thatch, and		This addresses needs of many but not all migratory sandpipers, plovers, and related species. [WBF]
	Habitats	unshaded waters shallower than 6 cm is: [Include also any area that is adjacent to the AA.] None, or <100 sq. m.	1	
		100-1000 sq. m.	0	
		1000 – 10,000 sq. m.	0	
F16	Hh	>10,000 sq. m. In aerial ("ducks eye") view, the maximum annual cover of herbaceous vegetation (all non-woody plants except moss) is:	0	[AM, WBF, WBN]
1 10	Herbaceous % of Vegetated Wetland			[AW, WOI , WOIV]
	3	<5% of the vegetated part of the AA or <0.01 hectare (whichever is less). Mark "1" here and SKIP to F20 (Invasive Plant Cover). 5-25% of the vegetated part of the AA.	0	
		25-50% of the vegetated part of the AA.	0	
		50-95% of the vegetated part of the AA.	0	
F17	Fort Course	>95% of the vegetated part of the AA. Within parts of the AA having harbacours sover (excluding SAA), the areal cover of forths reaches an appual maximum of	0	Forbs are flavoring plants. Do not include grasses, codess, cottail other graminoids, forms, horsetails
F17	Forb Cover	Within parts of the AA having herbaceous cover (excluding SAV), the areal cover of forbs reaches an annual maximum of:		Forbs are flowering plants. Do not include grasses, sedges, cattail, other graminoids, ferns, horsetails, or others that lack showy flowers. [POL]
		-5% of the herbaceous part of the AA. 5-25% of the herbaceous part of the AA.	0	
		25-50% of the herbaceous part of the AA.	0	
		50-95% of the herbaceous part of the AA.	0	
F10	Codgo Cour-	>95% of the herbaceous part of the AA.	0	[cc]
F18	Sedge Cover	Sedges (Carex spp.) and cottongrass (Eriophorum spp.) occupy:		[CS]
		45% of the vegetated area, or none. 5-50% of the vegetated area.	0	
		50-95% of the vegetated area.	0	
		>95% of the vegetated area.	0	
F19	Dominance of Most	Determine which two herbaceous species comprise the greatest portion of the herbaceous cover (excluding mosses and floating-leaved		For this question, include ferns as well as graminoids and forbs. [EC, INV, PH, POL, Sens]
	Abundant Herbaceous Species	aquatic plants). Then choose one of the following: those species together comprise > 50% of the areal cover of herbaceous plants at any time during the year.	0	
		those species together comprise > 50% of the areal cover of herbaceous plants at any time during the year. The species together do not comprise > 50% of the areal cover of herbaceous plants at any time during the year.	1	
F20	Invasive Plant Cover	How extensive is the cover of invasive plant species in the AA? For species, see Plants_invasive worksheet in the accompanying Supplnfo		[EC, PH, POL, Sens]
		file.		
		invasive species appear to be absent in the AA, or are present only in trace amount (a few individuals).	1	
		invasive species are present in more than trace amounts, but comprise <5% of herbaceous cover (or woody cover, if the invasives are woody).	0	
		invasive species comprise 5-20% of the herb cover (or woody cover, if the invasives are woody).	0	
		invasive species comprise 20-50% of the herb cover (or woody cover, if the invasives are woody).	0	
F21	Invacing Cover Nega	invasive species comprise >50% of the herb cover (or woody cover, if the invasives are woody). 		25-75% of the emergent vegetation.	0]	
		>75%, of the emergent vegetation.	0		

FieldF form - Non-tidal Page 3 of 5

F37	Interspersion of	During most of the part of the growing season when water is present, the spatial pattern of emergent vegetation within the water is mostly:		[AM, FA, FR, INV, NR, OE, PH, PR, SBM, SR, WBF, WBN]
	Emergents & Open		0	
	Water	Scattered. More than 30% of such vegetation forms small islands or corridors surrounded by water. Intermediate.	0	1
		Clumped. More than 70% of such vegetation is in bands along the wetland perimeter or is clumped at one or a few sides of the surface water area.	0	1
F38	Persistent Deepwater Area	If the deepest patch of surface water (flowing or ponded) in or directly adjacent to the AA is mostly deeper than 0.5 m for >2 weeks during the growing season, enter "1" and continue. If not, enter "0" and SKIP to F42.(Connection).	0	
F39	Non-vegetated Aquatic Cover	During most of the growing season and in waters deeper than 0.5 m, the cover for fish, aquatic invertebrates, and/or amphibians that is provided NOT by living vegetation, but by accumulations of dead wood and undercut banks is:		For this question, consider only the wood that is at or above the water surface. Estimates of underwate wood based only on observations from terrestrial viewpoints are unreliable so should not be attempted
		Little or none. Intermediate.	0	[AM, FA, FR, INV]
		Extensive.	0	†
F40	Isolated Island	The AA contains (or is part of) an island or beaver lodge within a lake, pond, or river, and is isolated from the shore by water depths > 1 m or all sides during an average June. The island may be solid, or it may be a floating vegetation mat that is sufficiently large and dense to support a waterbird nest.	n O	[WBN]
F41	Floating Algae & Duckweed	At some time of the year, mats of algae and/or duckweed are likely to cover >50% of the AA's otherwise-unshaded water surface, or blanket >50% of the underwater substrate. If true, enter "1" in next column. If untrue or uncertain, enter "0".	0	[EC, PR, WBF]
F42	Channel Connection & Outflow Duration	The most persistent surface water connection (outlet channel or pipe, ditch, or overbank water exchange) between the AA and a downslope stream network is: [Note: if the AA represents only part of a wetland, answer this according to whichever is the least permanent surface connection: the one between the AA and the rest of the wetland, or the surface connection between the wetland and the downslope stream network.]		Consider the connection regardless of whether the surface water is frozen. The "downslope stream network" could consist of ditches, rivers, ponds, or lakes which eventually connect to the ocean. If this cannot be determined while visiting the AA, consult topographic maps perhaps by viewing these online with Toporama (http://atlas.nrcan.gc.ca/toporama/en/index.html) [CS, FA, FR, NR, OE, PR, Sens, SFS SR, WCv, WS]
		Persistent (surface water flows out for >9 months/year). Seasonal (surface water flows out for 14 days to 9 months/year, not necessarily consecutive).	0	,,
		Temporary (surface water flows out for <14 days, not necessarily consecutive).	0	1
		None but maps show a stream network downslope from the AA and within a distance that is less than the AA's length. SKIP to F47 (pH Measurement).	0	
		No surface water flows out of the wetland except possibly during extreme events (-once per 10 years). Or, water flows only into a wetland, ditch, or lake that lacks an outlet. SKIP to F47 (pH Measurement).	0	
F43	Outflow Confinement	During major runoff events, in the places where surface water exits the AA or connected waters nearby, the water:	0	"Major runoff events" would include biennial high water caused by storms and/or rapid snowmelt. [CS, NR, OE, PR, Sens, SR, STR, WS]
		Mostly passes through a pipe, culvert, narrowly breached dike, berm, beaver dam, or other partial obstruction (other than natural topography) that does not appear to drain the wetland artificially during most of the growing season. Leaves through natural exits (channels or diffuse outflow), not mainly through artificial or temporary features.	1	
		Is exported more quickly than usual due to ditches or pipes within the AA or connected to its outlet, or within 10 m of the AA's edge, which	0	
F44	Tributary Channel	drain the wetland artificially, or water is pumped out of the AA. At least once annually, surface water from a tributary channel that is >100 m long moves into the AA. Or, surface water from a larger permanent water body adjacent to the AA splils into the AA. If it enters only via a pipe, that pipe must be fed by a mapped stream or lake	0	If inlet tributaries cannot be searched for due to inaccessibility of part of the AA, follow suggestions in F42 above. [NRv, PH, PRv, SRv]
F45		further upslope. If no, SKIP to F47 (pH Measurement). Based on lack of shade, water source characteristics, or actual temperature measurements, the inflow is likely to be warmer than surface	0	[WCv]
F40	Input Water Temperature	based on lack of shabe, water source characteristics, or actual temperature measurements, the limitow is likely to be warmer than surface water in the AA during part of most years. Enter 1= yes, 0= no.	Ü	[mca]
F46	Throughflow Resistance	During its travel through the AA at the time of peak annual flow, water arriving in channels: [select only the ONE encountered by most of the incoming water].		[FA, FR, INV, NR, OE, PR, SR, WS]
	ivesistance	Does not bump into many plant stems as it travels through the AA. Nearly all the water continues to travel in unvegetated (often incised) channels that have minimal contact with welland vegetation, or through a zone of open water such as an instream pond or lake.	0	
		Bumps into herbaceous vegetation but mostly remains in fairly straight channels. Bumps into herbaceous vegetation and mostly spreads throughout, or is in widely meandering, multi-branched, or braided channels.	0	
		Bumps into tree trunks and/or shrub stems but mostly remains in fairly straight channels. Bumps into tree trunks and/or shrub stems and follows a fairly indirect path from entrance to exit (meandering, multi-branched, or braided).	0	
F47	pH Measurement	The pH in most of the AA's surface water:		Preferably, measure this in larger areas of ponded surface water within the AA, or in streams that have
	•	Was measured, and is: [enter the reading in the column to the right.]		passed through (not along) most of the AA. Unless surface water is completely absent, do not dig hole or make depressions in peat in order to provide water for this measurement. Avoid measuring near
		Was not measured but surface water is present and is darkly tea-coloured. Or if no surface water, then mosses and plants that indicate peatland (e.g., Labrador tea) are prevalent. Enter "1". Neither of above. Enter "1".	0	roads or in puddles formed only by recent rain. [AM, FA, FR, NR, WBF, PH, PR, Sens, WBF, WBN]
F48	TDS and/or	The TDS (total dissolved solids) or conductivity off the AA's surface water is: (select the first true row with information):		See above for measurement guidance. [FR, INV, NRv, PH, PRv, Sens]
	Conductivity	TDS is: [Enter the reading in ppm or mg/t. in the column to the right, if measured, or answer next row.] Conductivity is [Enter the reading in uSicm in the column to the right.]		
		Conductivity is [Enter tine reading in ps.cm in the column to the right.] Was not measured, but plants that indicate saline conditions cover much of the vegetated AA. Enter "1".	0	1
10		Neither of above	1	IFA FD DIL CDM C WDF WDM
49	Beaver Probability	Use of the AA by beaver during the past 5 years is (select most applicable ONE):		[FA, FR, PH, SBM, Sens, WBF, WBN]
		Evident from direct observation or presence of gnawed limbs, dams, tracks, dens, lodges, or extensive stands of water-killed trees (snags).	0	
		Likely based on known occurrence in the region and proximity to suitable habitat, which may include: (a) a persistent freshwater wetland, pond, or lake, or a perennial low or mid-gradient (<10%) channel, and (b) a corridor or multiple stands of hardwood trees and shrubs in vegetated areas near surface water.	0	
ee.	0 1	Unlikely because site characteristics above are deficient, and/or this is a settled area or other area where beaver are routinely removed.	1	
F50	Groundwater Strength of Evidence	Select first applicable choice: Springs are known to be present within the AA, or if groundwater levels have been monitored, that has demonstrated that groundwater primarily discharges to the wetland for longer periods during the year than periods when the wetland recharges the groundwater.	0	Adhere to these criteria strictly do not use personal judgment based on fen conditions, pH, or other evidence. Consult topographic maps to detect breaks in slope described here. Rust deposits associated with groundwater seeps may be most noticeable as orange discoloration in ice formations
		Most of the AA has a slope of >5%, or is very close to the base of a natural slope longer than 100 and much steeper than the slope of the AA	, 0	along streams during early winter. [AM, CS, FA, FR, INV, NR, OE, PH, PRv, SFS, WC, WS]
		AND the pH of surface water, if known, is >5.5. Neither of above is true, although some groundwater may discharge to or flow through the AA. Or groundwater influx is unknown.	1	
F51	Internal Gradient	The gradient along most of the flow path within the AA is:		This is not the same as the shoreline slope. It is the elevational difference between the AA's inlet and
		<2% or the AA has no surface water outlet (not even seasonally).	0	outlet, divided by the flow-distance between them and converted to percent. If available, use a clinometer to measure this. Free clinometer apps can be downloaded to smartphones. If the wetland is
		2-5%. 6-10%.	0	targe (longer than –1 km), this may be estimated using Google Earth to determine the minimum and maximum elevation within the AA, then dividing by length and multiplying by 100. [CS, NR, OE, PR,

S4	Excessive Sediment Loading from Contribu	ting Area					
	In the last column, place a check mark next to any item present in the	e CA that is likely to have elevated the load of waterborne or wind	dborne sediment reaching the wetland from its CA. [FA, FR, INV,	PH, SRv, STR]			
Erosion from plowed fields, fill, timber harvest, dirt roads, vegetation clearing, fires.							
	Erosion from construction, in-channel machinery in the CA.						
	Erosion from off-road vehicles in the CA.						
	Erosion from livestock or foot traffic in the CA.						
	Stormwater or wastewater effluent.						
	Sediment from road sanding, gravel mining, other mining, oil/ gas ex	draction.			1		
	Accelerated channel downcutting or headcutting of tributaries due to	altered land use.					
	Other human-related disturbances within the CA.						
	If any items were checked above, then for each row of the table below then leave the "O's" for the scores in the following rows. To estimate of			add significantly more sediment or suspended solids to the AA,			
		Severe (3 points)	Medium (2 points)	Mild (1 point)			
	Erosion in CA:	Extensive evidence, high intensity.*	Potentially (based on high-intensity* land use) or scattered evidence.	Potentially (based on low-intensity* land use) with little or no direct evidence.	0		
	Recentness of significant soil disturbance in the CA:	Current & ongoing.	1-12 months ago.	>1 yr ago.	0		
	Duration of sediment inputs to the wetland:	Frequent and year-round.	Frequent but mostly seasonal.	Infrequent & during high runoff events mainly.	0		
	AA proximity to actual or potential sources:	0 - 15 m.	15-100 m.	In more distant part of contributing area.	0		
	* high-intensity= extensive off-road vehicle use, plowing, grading, exc	cavation, erosion with or without veg removal; low-intensity= veg	removal only with little or no apparent erosion or disturbance of	Sum=	0		
	soil or sediment.						
				Stressor subscore=	0.00		
S5	Soil or Sediment Alteration Within the Asses	ssment Area					
	In the last column, place a check mark next to any item present in the is less). [CS, INV, NR, PH, SR, STR]	e wetland that is likely to have compacted, eroded, or otherwise a	altered the wetland's soil. Consider only items occurring within pas	st 100 years or since wetland was created or restored (whichever	1		
	Compaction from machinery, off-road vehicles, livestock, or mountain	in bikes, especially during wetter periods.					
	Leveling or other grading not to the natural contour.						
	Tillage, plowing (but excluding disking for enhancement of native pla	ants).					
	Fill or riprap, excluding small amounts of upland soils containing org	anic amendments (compost, etc.) or small amounts of topsoil im	ported from another wetland.				
	Excavation.						
	Ditch cleaning or dredging in or adjacent to the wetland.						
	Boat traffic in or adjacent to the wetland and sufficient to cause short	e erosion or stir bottom sediments.					
	Artificial water level or flow manipulations sufficient to cause erosion	or stir bottom sediments.					
	If any items were checked above, then for each row of the table below effects, contrast the current condition with the condition if the checked		not measurably alter the soil structure and/or topography, then lea	ve the "O's" for the scores in the following rows. To estimate			
Severe (3 points) Medium (2 points) Mild (1 point)							
	Spatial extent of altered soil:	>95% of wetland or >95% of its upland edge (if any).	5-95% of wetland or 5-95% of its upland edge (if any).	<5% of wetland and <5% of its upland edge (if any).			
	Recentness of significant soil alteration in wetland:	Current & ongoing.	1-12 months ago.	>1 yr ago.			
	Duration:	Long-lasting, minimal veg recovery.	Long-lasting but mostly revegetated.	Short-term, revegetated, not intense.			
	Timing of soil alteration:	Frequent and year-round.	Frequent but mostly seasonal.	Mainly during one-time or scattered events.

Assessment Area (AA) Results:

Wetland ID: BB-Trib6-W-01

Date: 14 October 2019

Observer: Derrick Mitchell

Latitude & Longitude (decimal degrees): 45.181083, -66.206548

Scores will appear below after data are entered in worksheets OF, F, and S. See Manual for definitions and descriptions of how scores were computed.

Wetland Functions or Other Attributes:	Function Score (Normalised)	Function Rating	Benefits Score (Normalised)	Benefits Rating	Function Score (raw)	(raw)
Water Storage & Delay (WS)	2.93	Moderate	1.68	Lower	3.99	1.75
Stream Flow Support (SFS)	6.25	Moderate	3.06	Moderate	3.33	1.78
Water Cooling (WC)	6.38	Higher	3.21	Moderate	4.25	1.93
Sediment Retention & Stabilisation (SR)	2.18	Moderate	1.69	Lower	4.65	1.02
Phosphorus Retention (PR)	3.10	Moderate	1.24	Lower	5.10	1.46
Nitrate Removal & Retention (NR)	0.84	Lower	4.94	Moderate	4.35	5.50
Carbon Sequestration (CS)	6.08	Higher			7.18	
Organic Nutrient Export (OE)	7.80	Higher			6.47	
Anadromous Fish Habitat (FA)	0.00	Lower	0.00	Lower	0.00	0.00
Resident Fish Habitat (FR)	0.00	Lower	0.00	Lower	0.00	0.00
Aquatic Invertebrate Habitat (INV)	2.34	Lower	3.78	Moderate	4.70	3.28
Amphibian & Turtle Habitat (AM)	5.19	Moderate	4.24	Moderate	6.04	4.66
Waterbird Feeding Habitat (WBF)	4.71	Moderate	2.50	Moderate	3.74	2.50
Waterbird Nesting Habitat (WBN)	2.54	Moderate	2.50	Moderate	2.17	2.50
Songbird, Raptor, & Mammal Habitat (SBM)	9.34	Higher	2.50	Lower	7.75	2.50
Pollinator Habitat (POL)	10.00	Higher	0.00	Lower	9.25	0.00
Native Plant Habitat (PH)	7.07	Higher	6.53	Higher	5.94	5.67
Public Use & Recognition (PU)			2.07	Lower		1.80
Wetland Sensitivity (Sens)			0.00	Lower		2.00
Wetland Ecological Condition (EC)			7.59	Higher		8.61
Wetland Stressors (STR) (higher score means more stress)			4.52	Moderate		3.92
Summary Ratings for Grouped Functions:						
HYDROLOGIC Group (WS)	6.25	Higher	1.68	Lower	3.99	1.75
WATER QUALITY SUPPORT Group (max+avg/2 of SR, PR, NR, CS)	2.57	Lower	3.78	Lower	6.25	4.08
AQUATIC SUPPORT Group (max+avg/2 of SFS, INV, OE, WC)	6.75	Higher	3.57	Moderate	5.58	2.81
AQUATIC HABITAT Group (max+avg/2 of FA, FR, AM, WBF, WBN)	3.84	Moderate	3.04	Lower	4.22	3.30
TRANSITION HABITAT Group (max+avg/2 of SBM, PH, POL)	9.40	Higher	4.77	Moderate	8.45	4.19
WETLAND CONDITION (EC)			7.59	Higher		8.61
WETLAND RISK (average of Sensitivity & Stressors)			2.26	Lower		2.96

NOTE: A score of 0 does not mean the function or benefit is absent from the wetland. It means only that this wetland has a capacity that is equal or less than the lowest-scoring one, for that function or benefit, from among the 98 NB calibration wetlands that were assessed previously.

Cover Page: Basic Description of Assessment	WESP-AC version 2	
Site Name:	Burchill Wind Energy Project - FC-Trib2-W-02	
Investigator Name:	Derrick Mitchell	
Date of Field Assessment:	14 October 2019	
Nearest Town:	Lorneville (west Saint John), New Brunswick	
Latitude (decimal degrees):	45.192947	
Longitude (decimal degrees):	-66.206379	
Is a map based on a formal on-site wetland delineation available?	Yes	
Approximate size of the Assessment Area (AA, in hectares):		
AA as percent of entire wetland (approx.). Attach sketch map if AA is smaller than the entire contiguous wetland.		
What percent (approx.) of the wetland were you able to visit?	100	
What percent (approx.) of the AA were you able to visit?	100	
Were you able to ask the site owner/manager about any of the questions?	No	
Indicate here if you intentionally surveyed for rare plants, calciphile plants, or rare animals:	Yes	
Have you attended a WESP-AC training session? If so, indicate approximate month & year.	Yes, September 2016	
How many wetlands have you assessed previously using WESP-AC? (approx.)	100+	
Comments about the site or this WESP-AC assessment (attach extra page if desired):		

Form OF (Office). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Conduct an assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answering many of the questions below will equire using these online map viewers:

Google Earth Pro: https://www.google.com/earth/download/gep/agree.html

GeoNB: http://www.snb.ca/geonb1/ and http://www.snb.ca/geonb1/e/apps/apps-E.asp

Geons: http://www.snb.ca/geonol/ and http://www.snb.ca/geonol/e/apps/apps/apps-ta-asp For most wetlands, completing this office data form will require 1-2 hours. For a list of functions to which each question pertains, see bracketed abbreviations in the Definitions/Explanations column. For detailed descriptions of each WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity,

		0.5 - 1 km, but separated by those features.	0			
		None of the above (the closest patches or corridors that large are >1 km away).	0			
OF14	Distance to Large Ponded Water	The distance from the AA center to the closest (but separate)non-tidal body of water that is ponded during most of the year and islarger than 8 hectares during most of a normal year is:		Determine this by viewing aerial imagery in Google Earth. [Sens, WBF, WBN]		
		<100 m.	0			
		100 m - 1 km.	1			
		1 - 2 km. 2-5 km.	0	-		
		2-5 km. 5-10 km.	0			
		>10 km.	0	1		
OF15	Tidal Proximity	The distance from the AA edge to the closesttidal water body (regardless of its salinity) is:		In Google Earth, measure the distance to the ocean (including Bay of Fundy) or tidal river, whichever		
		<100 m.	0	is closer. If you need to see how far upriver a river is tidal, see the KMZ file provided with this calculator for NB (NB Headtide). Points shown in those files are only an approximation, so local		
		100 m - 1 km.	0	information if available may be preferable. [FA, WBF]		
		1 - 5 km. 5-10 km.	0			
		10-40 km.	0			
		>40 km.	0			
OF16	Upland Edge Contact	Select one:		[NR, SBM, Sens]		
		The AA has no upland edge (or upland is <1% of perimeter). The AA is entirely surrounded by (& contiguous with) other wetlands or water	0			
		1-25% of the AA's perimeter abuts upland (including filled areas). The rest adjoins other wetlands or water that is mostly wider than the AA	0			
		25-50% of the AA's perimeter abuts upland. The rest adjoins other wetlands or water that is mostly wider than the AA.	0			
		50-75% of the AA's perimeter abuts upland. The rest adjoins other wetlands or water that is mostly wider than the AA.	0			
		More than 75% of the AA's perimeter abuts upland. Any remainder adjoins other wetlands or water that is mostly wider than the AA.This will be true for most assessments done with WESP-AC.	1			
OF17	Flood Damage from Non-	Within 5 km downstream or downslope of the AA (select first true choice):		In the GeoNB map viewer: click on "More" in upper right, then "Flood Information". Expand the menu		
	tidal Waters	Maps show Flood Zone or Flood Risk areas and there appears to be infrastructure vulnerable to river flooding not caused by tidal storm	0	under it by clicking on the arrow to its left and the slider to its right. Uncheck the first (Limits of Data) box. Where available, LiDAR imagery can provide finer elevational resolution useful for flood		
		surges. Maps show Flood Zone or Flood Risk areas, but infrastructure is absent or is not vulnerable to floods from a non-tidal river. In some cases	0	modeling. [WSv]		
		levees, upriver dams, or other measures may partly limit damage or risk from smaller events. Maps do not show Flood Zone or Flood Risk areas (or no such mapping has been done locally) and there appears to be infrastructure	0			
		vulnerable to river flooding unrelated to tidal storm surges. Maps do not show Flood Zone or Flood Risk areas (or no such mapping has been done locally) and there is no infrastructure vulnerable	1			
OF18	Relative Elevation in	to river flooding unrelated to tidal storm surges. In Google Earth, enable the Terrain layer (lower left menu) and open the NB. Watersheds KMZ file that accompanies this calculator. Then		IFA. NR. Sens. SFSv. WCv. WSvI		
	Watershed	determine the AA's approximate elevation (bottom right, NOT the "eye alt"). Then move cursor around to determine the watershed's maximum and minimum elevation. Divide the AA's elevation by the (max-min).	0.20			
OF19	Water Quality Sensitive Watershed or Area	In Google Earth, open the KMZ file NB_Watershed Protected Area which accompanies this calculator. The AA is within such an area. Enter 1= yes, 0= no.	0	If an ACCDC report is available for this AA, it also may contain such information. [NRv]		
OF20	Degraded Water Upstream	Sampling indicates a problem with concentrations ofmetals, hydrocarbons, nutrients, or other substances (excluding bacteria, acidic water, high temperatures) being present at levels harmful to aquatic life or humans, and:		May use existing data, or sample those waters as part of this wetland assessment. "Harmful" should be evaluated with regard to current federal or provincial water quality standards. [AM, FA, FR, NRv,		
		The condition is present within the AA.	0	PRv, SRv, STR, WBF, WBN]		
		The condition is present in waters within 1 km that flowinto the AA, but has not been documented in the AA itself.	0			
		Sampling during both low water periods and times with high runoff (storms, snowmelt) indicates no problems in either the AA or inflowing	0			
		waters. Data are insufficient (no or inadequate sampling within 1 km, or condition exists only at >1 km upstream)This is the situation for nearly	1			
OF21	Dograded Water	all wetlands in this region. The problem described above is downslope from the AA, and:		May use existing data, or monitor waters as part of this wetland assessment. [NRv, PRv, SRv]		
UFZI	Degraded Water Downstream			may use existing uata, or mornior waters as part or this wettand assessment. [tvkv, Pkv, Skv]		
		The condition is present within 1 km downslope and connected to the AA by a channel. The condition is present within 5 km downslope and connected to the AA by a channel, or within 1 km but not connected to the AA by a	0			
		channel.				
		Sampling during both low water periods and times with high runoff (storms, snowmelt) indicates no problems in either the AA or inflowing waters.	0			
		Data are insufficient (no or inadequate sampling within 1 km, or condition exists only at >1 km upstream)This is the situation for nearly all wetlands in this region.	1			
OF22	Wetland as a % of its Contributing Area (Catchment)	From a topographic map and field observations, estimate the approximate boundaries of the catchment (CA) of the entire wetland of which the AA may be only a part. Then adjust those boundaries if necessary based on your field observations of the surrounding terrain, and/or to using procedures described in the Manual. Divide the area of the wetland (not just the AA) by the approximate area of its catchment excluding the area of the wetland itself. When doing the calculation, if ponded water is adjacent to the wetland, include that in the wetland area. The result is: -0.01, or catchment size unknown due to stormwater pipes that collect water from an indeterminate area.	0	Topographic maps may be viewed online at the National Atlas of Canada (Toporama): http://atlas.gc.ca/loporama/en/index.html [NR, PR, Sens, SR, WS]		
		0.01 to 0.1. 0.1 to 1.	0

Form F (Field). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Walk for no less than 10 minutes from the wetland edge towards its core, in the part of the AA that is proposed for alteration. If no alteration is proposed, walk in a portion that appears to be most representative of the wetland overall. Walk only where it is safe and legal to do so. Conduct the assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answer these questions primarily based on your onsite observations and interpretations. Do not write in shaded parts of this data form. Answering some questions accurately may require conferring with the landowner or other knowledgable persons and/or reviewing aerial imagery. For most wetlands, completing this field data form will require 1-2 hours on a site. For a list of functions to which each question pertains, see the accompanying Interpretations form. For detailed descriptions of each WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage & Delay, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity, STR= Stressors.

	India-4	Condition Chalana	Dete	Pofinitions /F
#	Indicators	Condition Choices	Data	Definitions/Explanations
1	Wetland Type	Follow the key below and mark the ONE row that best describes MOST of the vegetated part of the AA:		Ericaceous shrubs are ones in the heather family (Ericaceae). Most have leathery evergreen leaves. They include rhododendron, azalea, swamp laurel, leatherleaf, Labrador tea, and others. Most require
		A. Moss and/or lichen cover more than 25% of the ground. Often dominated by ericaceous shrubs (e.g., Labrador tea) or other acid-tolerant plants (e.g., bog caraberry, pilcher plant, sudew, or cribids). Substrate is mostly undecomposed peat. Choose between A1 and A2 and mark the choice with a 1 in their adjoining column. Otherwise go to B below.		acidic soil. Although not in the family Ericaceae, sweetgale (<i>Myrica gale</i>) should be counted also. [AM, CS, FA, FR, INV, NR, OE, PH, Sens, SFS, WBF, WBN]
		A1. Surface water is usually absent or, if present, pH is typically <4.5 and conductivity is usually <100 µSicm (<64 ppm TDS). Trees are absent or nearly so. Sedge cover usually sparse or absent but cottongrass and/or lichen cover may be extensive, as well as cloudberry, lingonberry, sheep laurel, and a sedge (Carex rarillora). Wetland surface and surrounding landscape are seldom sloping and wetland often is domed (convex). Inlet and outlet channels are usually absent. If known, pH of peat is <4.0.	0	
		A2. Not A1. Surface water, if present, has pH typically >4.5 and conductivity is usually >100 µS/cm (>64 ppm TDS). Sedge cover is usually extensive, and/or tree and fall shrub cover is extensive. Sometimes at toe of slope or edge of water body. An exit channel is usually present. Wetter than A1 and peat depth may be shallower (<2 m).	0	
		B. Moss and/or lichen cover less than 25% of the ground. Soil is mineral or decomposed organic (muck). Choose between B1 and B2 and mark the choice with a 1 in their adjoining column:		
		B1. Trees and shrubs taller than 1 m comprise more than 25% of the vegetated cover. Surface water is mostly absent or inundates the vegetation only seasonally (e.g., vernal pools or floodplain).	1	
		B2. Not B1. Tree & tall shrubs comprise less than than 25% of the vegetated cover. Vegetation is mostly herbaceous, e.g., cattail, bulrush, burreed, pond lily, horsetail. Surface water may be extensive and fluctuates seasonally, being either persistent or drying up partly or entirely.	0	
A shi nclude adja d lescrii	ould also include part of the open water part ad cent " is used synonymo bed features along their	the AA should include all persistent waters in ponds smaller than 8 hectares (-283 m on a side) that are adjacent to the AA. The the water area of adjacent ponded water larger than 8 ha and adjacent rivers wider than 20 m. Specifically, the AA should [jacent to wetland vegetation and equal in width to the average width of that vegetated zone. Throughout this da form, usly with abutting, adjoining, bordering, contiguous and means no upland (manmade or natural) completely separates the directly shared edge. Features joined only by a channel are not necessarily considered to be adjacent a large portion of their res do not have to be hydrologically connected in order to be considered adjacent.		
2	National Trans			1 July 1 1000
2	Wetland Types - Adjoining or Subordinate	If the AA is smaller than 1 ha, mark all other types that occupy more than 1% of the vegetated AA. If the AA is larger than 1 ha, mark all other types which are within or adjacent to the AA and occupy more than 1 ha, as visible from the AA or as interpreted from aerial imagery. Do not mark again the type marked in F1.		1 hectare is 10,000 sq. m or about 2.5 acres. It could have dimensions of 100 m by 100 m, 1000 m b 10 m, or similar. [AM, INV, SBM, WBF]
		A1. A2.	0	
		B1.	0	
		B2.	0	
3	Woody Height & Form Diversity	Following EACH row below, indicate with a number code the percentage of the living vegetation in the AA which is occupied by that feature (6 if >95%, 5 if 75-95%, 4 if 50-75%, 3 if 25-50%, 2 if 5-25%, 1 if <5%, 0 if none). If the vegetated part of the AA is largely herbaceous (non-woody) vegetation, these percentages should not sum to 100%.		Deciduous shrubs in this region usually include butlonbush, Labrador tea, bayberry (Morella), huckleberry, cranberry, cloudberry, sweetgale, alder, willow, birch, ash, dogwood, and a few others. I you assigned a code of 3 or higher to any of the first four choices and the ground cover beneath the trees/shrubs is <25% moss, then question F1 might be "B1". [CS, INV, NR, PH, POL, SBM, Sens]
		coniferous trees (may include tamarack) taller than 3 m. deciduous trees taller than 3 m.	2	
		coniferous or ericaceous shrubs or trees 1-3 m tall not directly below the canopy of trees.	0	
		deciduous shrubs or trees 1-3 m tall not directly below the canopy of trees.	5	
		coniferous or ericaceous shrubs <1 m tall not directly below the canopy of taller vegetation. deciduous shrubs or trees <1 m tall (e.g., deciduous seedlings) not directly below the canopy of taller vegetation.	0	
ote :	If none of top 4 rows in	F3 was marked 2 or greater , SKIP to F9 (N fixers).		
1	Dominance of Most	Determine which two woody plant species comprise the greatest portion of the low (<3 m) woody cover . Then choose one:		[PH, POL, SBM, Sens]
	Abundant Shrub Species	those species together comprise > 50% of such cover.	0	
1	Woody Diameter	those species together do not comprise > 50% of such cover. Mark ALL the types that comprise >5% of the woody canopy cover in the AA or >5% of the wooded areas (if any) along its upland edge	1	Estimate the diameters at chest height. If small-diameter trees are overlopped (shaded) by larger
	Classes	(perimeter). The edge should include only the trees whose canopies extend into the AA.		ones, visualise a "subcanopy" at the average height of the smaller-dbh trees, to serve as a basis for minimum 5% canopy requirement in this question. The trees and shrubs need not be wetland specie

		<1% of the emergent vegetation, or emergent vegetation is absent. SKIP to F38.	0	
		1-25% of the emergent vegetation.	0	
		25-75% of the emergent vegetation. >75%, of the emergent vegetation.	0	1
			_	

FieldF form - Non-tidal Page 3 of 5

F37	Interspersion of	During most of the part of the growing season when water is present, the spatial pattern of emergent vegetation within the water is mostly:		[AM, FA, FR, INV, NR, OE, PH, PR, SBM, SR, WBF, WBN]
	Emergents & Open Water	Scattered. More than 30% of such vegetation forms small islands or corridors surrounded by water.	0	
	water	Intermediate.	0	
		Clumped. More than 70% of such vegetation is in bands along the wetland perimeter or is clumped at one or a few sides of the surface water area.	0	
F38	Persistent Deepwater	If the deepest patch of surface water (flowing or ponded) in or directly adjacent to the AA is mostly deeper than 0.5 m for >2 weeks during the growing season, enter "1" and continue. If not, enter "0" and SKIP to F42 (Connection).	0	
F39	Area Non-vegetated Aquatic	During most of the growing season and in waters deeper than 0.5 m, the cover for fish, aquatic invertebrates, and/or amphibians that is		For this question, consider only the wood that is at or above the water surface. Estimates of underwater
	Cover	provided NOT by living vegetation, but by accumulations of dead wood and undercut banks is:		wood based only on observations from terrestrial viewpoints are unreliable so should not be attempted. [AM, FA, FR, INV]
		Little or none. Intermediate.	0	[Paul, I.A., I.K., III49]
		Extensive.	0	
F40	Isolated Island	The AA contains (or is part of) an island or beaver lodge within a lake, pond, or river, and is isolated from the shore by water depths > 1 m on all sides during an average June. The island may be solid, or it may be a floating vegetation mat that is sufficiently large and dense to support a waterbird nest.	0	[WBN]
	Duckweed	At some time of the year, mats of algae and/or duckweed are likely to cover >50% of the AA's otherwise-unshaded water surface, or blanket >50% of the underwater substrate. If true, enter "1" in next column. If untrue or uncertain, enter "0".	0	[EC, PR, WBF]
F42	Channel Connection & Outflow Duration	The most persistent surface water connection (outlet channel or pipe, ditch, or overbank water exchange) between the AA and a downslope stream network is: [Note: If the AA represents only part of a welland, answer this according to whichever is the least permanent surface connection: the one between the AA and the rest of the wetland, or the surface connection between the wetland and the downslope stream network.] Persistent (surface water flows out for >9 months/year).	0	Consider the connection regardless of whether the surface water is frozen. The "downslope stream network" could consist of ditches, rivers, ponds, or lakes which eventually connect to the ocean. If this cannot be determined while visiting the AA, consult topographic maps perhaps by viewing these online with Toporama (http://atlas.nrcan.gc.ca/toporama/en/index.html) [CS, FA, FR, NR, OE, PR, Sens, SFS SR, WCv, WS]
		Seasonal (surface water flows out for 14 days to 9 months/year, not necessarily consecutive).	0	
		Temporary (surface water flows out for <14 days, not necessarily consecutive). None but maps show a stream network downslope from the AA and within a distance that is less than the AA's length. SKIP to F47 (pH	0	
		Measurement).		
		No surface water flows out of the wetland except possibly during extreme events (<once (ph="" 10="" a="" an="" ditch,="" f47="" flows="" into="" lacks="" lake="" measurement).<="" only="" or="" or,="" outlet.="" per="" skip="" td="" that="" to="" water="" wetland,="" years).=""><td>0</td><td></td></once>	0	
F43	Outflow Confinement	During major runoff events, in the places where surface water exits the AA or connected waters nearby, the water:		"Major runoff events" would include biennial high water caused by storms and/or rapid snowmelt. [CS, NR, OE, PR, Sens, SR, STR, WS]
		Mostly passes through a pipe, culvert, narrowly breached dike, berm, beaver dam, or other partial obstruction (other than natural topography) that does not appear to drain the wetland artificially during most of the growing season.	1	
		Leaves through natural exits (channels or diffuse outflow), not mainly through artificial or temporary features. Is exported more quickly than usual due to ditches or pipes within the AA or connected to its outlet, or within 10 m of the AA's edge, which	0	
544	T. 1. Ol. 1.	drain the wetland artificially, or water is pumped out of the AA.		If in the state of the AA fellows
F44	Tributary Channel	At least once annually, surface water from a tributary channel that is >100 m long moves into the AA. Or, surface water from a larger permanent water body adjacent to the AA spills into the AA. If it enters only via a pipe, that pipe must be fed by a mapped stream or lake further upslope. If no, SKIP to F47 (pH Measurement).	0	If inlet tributaries cannot be searched for due to inaccessibility of part of the AA, follow suggestions in F42 above. [NRv, PH, PRv, SRv]
F45	Input Water Temperature	Based on lack of shade, water source characteristics, or actual temperature measurements, the inflow is likely to be warmer than surface water in the AA during part of most years. Enter 1= yes, 0= no.	0	[WCv]
F46	Throughflow	During its travel through the AA at the time of peak annual flow, water arriving in channels: [select only the ONE encountered by most of the incoming water].		[FA, FR, INV, NR, OE, PR, SR, WS]
	Resistance	Does not bump into many plant stems as it travels through the AA. Nearly all the water continues to travel in unvegetated (often incised)	0	
		channels that have minimal contact with wetland vegetation, or through a zone of open water such as an instream pond or lake.		
		Bumps into herbaceous vegetation but mostly remains in fairly straight channels. Bumps into herbaceous vegetation and mostly spreads throughout, or is in widely meandering, multi-branched, or braided channels.	0	
		Bumps into tree trunks and/or shrub stems but mostly remains in fairly straight channels. Bumps into tree trunks and/or shrub stems and follows a fairly indirect path from entrance to exit (meandering, multi-branched, or braided).	0	
F47	pH Measurement	The pH in most of the AA's surface water:		Preferably, measure this in larger areas of ponded surface water within the AA, or in streams that have passed through (not along) most of the AA. Unless surface water is completely absent, do not dig holes
		Was measured, and is: [enter the reading in the column to the right.] Was not measured but surface water is present and is darkly tea-coloured. Or if no surface water, then mosses and plants that indicate	0	or make depressions in peat in order to provide water for this measurement. Avoid measuring near
		peatland (e.g., Labrador tea) are prevalent. Enter "1".	0	roads or in puddles formed only by recent rain. [AM, FA, FR, NR, WBF, PH, PR, Sens, WBF, WBN]
F48	TDS and/or	Neither of above. Enter "1". The TDS (total dissolved solids) or conductivity off the AA's surface water is: (select the first true row with information):	1	See above for measurement guidance. [FR, INV, NRv, PH, PRv, Sens]
	Conductivity	TDS is: [Enter the reading in ppm or mg/L in the column to the right, if measured, or answer next row.]		
		Conductivity is [Enter the reading in µS/cm in the column to the right.] Was not measured, but plants that indicate saline conditions cover much of the vegetated AA. Enter "1".	0	
		Was not measured, but plants that indicate saline conditions cover much or the vegetated AAL criter 1. Neither of above	1	
F49	Beaver Probability	Use of the AA by beaver during the past 5 years is (select most applicable ONE):		[FA, FR, PH, SBM, Sens, WBF, WBN]
		Evident from direct observation or presence of gnawed limbs, dams, tracks, dens, lodges, or extensive stands of water-killed trees (snags).	0	
		Likely based on known occurrence in the region and proximity to suitable habitat, which may include: (a) a persistent freshwater wetland, pond, or lake, or a perennial low or mid-gradient (<10%) channel, and (b) a corridor or multiple stands of hardwood trees and shrubs in vegetated areas near surface water.	0	
TEO.	Croundy-t C:	Unlikely because site characteristics above are deficient, and/or this is a settled area or other area where beaver are routinely removed.	1	Adhere to there exists existing strictly do not we record induced to the control of the control
F50	Groundwater Strength of Evidence	Select first applicable choice: Springs are known to be present within the AA, or if groundwater levels have been monitored, that has demonstrated that groundwater primarily discharges to the wetland for longer periods during the year than periods when the wetland recharges the groundwater.	0	Adhere to these criteria strictly do not use personal judgment based on fen conditions, pH, or other evidence. Consult logorgaphic maps to detect breaks in Jospe described here. Rust deposits associated with groundwater seeps may be most noticeable as orange discoloration in ice formations along streams during early winter. [AM, CS, FA, FR, INV, NR, OE, PH, PRV, SFS, WC, WS]
		Most of the AA has a slope of >5%, or is very close to the base of a natural slope longer than 100 and much steeper than the slope of the AA, AND the pH of surface water, if known, is >5.5.	0	
FE4	Internal Condin	Neither of above is true, although some groundwater may discharge to or flow through the AA. Or groundwater influx is unknown.	1	This is not the come as the charoline along the the about the state of
F51	Internal Gradient	The gradient along most of the flow path within the AA is: <8 or the AA has no surface water outlet (not even seasonally).	1	This is not the same as the shoreline slope. It is the elevational difference between the AA's inlet and outlet, divided by the flow-distance between them and converted to percent. If available, use a
		<2% of the AA has no surface water outlet (not even seasonally). 2-5%.	0	clinometer to measure this. Free clinometer apps can be downloaded to smartphones. If the wetland is large (longer than -1 km), this may be estimated using Google Earth to determine the minimum and
		6-10%. >10%.	0	maximum elevation within the AA, then dividing by length and multiplying by 100. [CS, NR, OE, PR, SR, WBF, WBN, WS]

53	Type of Cover in Buffer	Within 30 m upslope of where the wetland transitions to upland, the upland land cover that is NOT perennial vegetation is mostly (mark ONE):		[AM, FA, INV, NRv, PH, POL, SBM, STR, WBN]
	Type of cover in buller			, , , , , , , , , , , , , , , , , , , ,
		Impervious surface, e.g., paved road, parking lot, building, exposed rock.	1	
		Bare or nearly bare pervious surface or managed vegetation, e.g., lawn, row crops, unpaved road, dike, landslide.	0	
54	Buffer Slope	The steepest and/or most disturbed part of the upland area that is within 30 m of the welland and occupies >10% of that upland area has a percent slope of:		[NRv, PRv, Sens, SRv]
		<1% (flat almost no noticeable slope) or all the area within 30 m of the AA edge is other wetlands. 2-5%.	0	
		5-30%.	1	
		>30%.	0	
55	Cliffs or Steep Banks	In the AA or within 100 m, there are elevated terrestrial features such as cliffs, talus slopes, stream banks, or excavated pits (but not riprap)	0	Do not include upturned trees as potential den sites. [POL, SBM]
		that extend at least 2 m nearly vertically, are unvegetated, and potentially contain crevices or other substrate suitable for nesting or den areas. Enter 1 (yes) or 0 (no).		
	New or Expanded Wetland	Human actions within or adjacent to the AA have persistently expanded a naturally occurring wetland or created a wetland where there previously was none (e.g., by excavation, impoundment):		Determine this using historical aerial photography, old maps, soil maps, or permit files as available [CS NR, OE, PH, Sens]
		No.	1	
		Yes, and created or expanded 20 - 100 years ago.	0	
		Yes, and created or expanded 3-20 years ago.	0	
		Yes, and created or expanded within last 3 years.	0	
		Yes, but time of origin or expansion unknown.	0	
		Unknown if new or expanded within 20 years or not.	0	
57	Burn History	More than 1% of the AA's previously vegetated area:		Look for charred soil or stumps (in multiple widely-spaced locations) or ask landowner. [CS, PH, STR]
		Burned within past 5 years.	0	
		Burned 6-10 years ago.	0	
		Burned 11-30 years ago.	0	
		Burned >30 years ago, or no evidence of a burn and no data.	1	
58	Visibility	The maximum percentage of the wetland that is visible from the best vantage point on public roads, public parking lots, public buildings, or public maintained trails that intersect, adjoin, or are within 100 m of the AA (select one) is:		[PU, STR, WBFv]
		<25%.	1	
		25-50%.	0	
		>50%.	0	
59	Non-consumptive	Assuming access permission was granted, select ALL statements that are true of the AA as it currently exists:		[PU, STR]
	Uses - Actual or Potential	For an average person, walking is physically possible in (not just near) >5% of the AA during most of the growing season, e.g., free of deep	1	
	rotential	water and dense shrub thickets. Maintained roads, parking areas, or foot-trails are within 10 m of the AA, or the AA can be accessed part of the year by boats arriving via	0	
		contiguous waters. Within or near the AA, there is an interpretive center, trails with interpretive signs or brochures, and/or regular guided interpretive tours.	0	
60	Unvisited Core Area	The percentage of the AA almost never visited by humans during an average growing season probably comprises: [Note: Only include the		[AM, FAv, FRv, PH, PU, SBM, STR, WBF, WBN]
	Onvision Coronica	part actually walked or driven (not simply viewed from) with a vehicle or boat. Do not include visitors on trails outside of the AA unless more		, , , , , , , , , , , , , , , , , , , ,
		than half the wetland is visible from the trails and they are within 30 m of the wetland edge. In that case include only the area occupied by the trail.]		
		<5% and no inhabited building is within 100 m of the AA.	0	
		<5% and inhabited building is within 100 m of the AA.	0	
		5-50% and no inhabited building is within 100 m of the AA.	0	
		5-50% and inhabited building is within 100 m of the AA.	0	1
		50-95%, with or without inhabited building nearby.	0	1
		>95% of the AA with or without inhabited building nearby.	1	
61	Frequently Visited Area	The part of the AA visited by humans almost daily for several weeks during an average growing season probably comprises: [See note above.]		[AM, PH, PU, SBM, STR, WBF, WBN]
		<5%. If F60 was answered ">95%" (mostly never visited), SKIP to F64.	1	
		5-50%.	0	
		50-95%.	0	
		>95% of the AA.	0	
62	BMP - Soils	Boardwalks, paved trails, fences or other infrastructure and/or well-enforced regulations appear to effectively prevent visitors from walking on soil within nearly all of the AA when the soil is unfrozen. Enter "1" if true.	0	[PH, PU]
63	BMP - Wildlife Protection	Fences, observation blinds, platforms, paved trails, exclusion periods, and/or well-enforced prohibitions on motorised boats, off-leash pels, and off road vehicles appear to effectively exclude or divert visitors and their pets from the AA at critical times in order to minimize disturbance of wildlife (except during hunting seasons). Enter "1" if true.	0	[AM, PU, WBF, WBN]
64	Consumptive Uses	Recent evidence was found within the AA of the following potentially-sustainable consumptive uses. Select ALL that apply.		[FAv, FRv, WBFv]
	(Provisioning Services)	Low-impact commercial timber harvest (e.g., selective thinning).	0	
		Commercial or traditional-use harvesting of native plants, their fruits, or mushrooms.	0	1
		Waterfowl hunting.	0	1
		Fishing.	0	1
		Trapping of furbearers.	0]
		None of the above.	1	
65	Domestic Wells	The closest wells or water bodies that currently provide drinking water are:		[NRv]
		Within 0-100 m. of the AA.	0	
		100-500 m. away.	0	1
		>500 m. away, or no information.	1	1
,				(DLL DD)
66	Calcareous Fen	The AA is, or is part of, a calcareous fen. See the Plants_Calcar worksheet in the accompanying SuppInfo file for list of plant indicators	0	[PH, PR]

igator: Derrick Mitchell	Site Identifier: FC-Trib2-W-02	D.	ate: 14 October 2019				
essor (S) Data Form for Non-Tidal	Wetlands WESP-AC for New B	runswick Version 2					
Aberrant Timing of Water Inputs	Wetterland. Weer Ad for New B	Turiowick: Voloion 2.					
	the standard of the standard o						
In the last column, place a check mark next to any item that is likely to more temporal homogeneity of flow or water levels) or more flashy (la			nutea (smaller of less frequent peaks spread over longer time:				
Stormwater from impervious surfaces that drains directly to the wetla	and.						
Water subsidies from wastewater effluent, septic system leakage, sn	ow storage areas, or irrigation.						
Regular removal of surface or groundwater for irrigation or other con	sumptive use.						
Flow regulation in tributaries or water level regulation in adjoining wa	iter body, or other control structure at water entry points that regu	ulates inflow to the wetland.					
A dam, dike, levee, weir, berm, or fill within or downgradient from t		t of the AA (e.g., road fill, wellpads, pipelines).					
Excavation within the wetland, e.g., dugout, artificial pond, dead-end	ditch.						
Artificial drains or ditches in or near the wetland.							
Accelerated downcutting or channelization of an adjacent or internal	channel (incised below the historical water table level).						
Logging within the wetland.	poshinory livesteek fire drainage or off read vehicles						
Subsidence or compaction of the wetland's substrate as a result of n Straightening, ditching, dredging, and/or lining of tributary channels.	lacilinery, livestock, life, drainage, or on road verticles.						
If any items were checked above, then for each row of the table below	w assign noints. However if you helieve the checked items had a	no measurable effect on the timing of water conditions in any part of	f the AA then leave the "O's" for the scores in the following row				
To estimate effects, contrast the current condition with the condition if		to measurable effect on the lifting of water conditions in any part of	i the AA, then leave the "03" for the scores in the following for				
	Severe (3 points)	Medium (2 points)	Mild (1 point)				
Spatial extent of timing shift within the wetland:	>95% of wetland.	5-95% of wetland.	<5% of wetland.				
When most of the timing shift began:	<3 yrs ago.	3-9 yrs ago.	10-100 yrs ago.				
Score the following 2 rows only if the altered inputs began within past			200				
Input timing now vs. previously:	Shift of weeks.	Shift of days.	Shift of hours or minutes.				
Flashiness or muting:	Became very flashy or controlled.	Intermediate.	Became mildly flashy or controlled.

	buting Area							
In the last column, place a check mark next to any item present in the CA that is likely to have elevated the load of waterborne or windborne sediment reaching the wetland from its CA. [FA, FR, INV, PH, SRv, STR]								
Erosion from plowed fields, fill, limber harvest, dirt roads, vegetation clearing, fires.								
Erosion from construction, in-channel machinery in the CA.								
Erosion from off-road vehicles in the CA.								
Erosion from livestock or foot traffic in the CA.								
Stormwater or wastewater effluent.								
Sediment from road sanding, gravel mining, other mining, oil/ ga	as extraction.							
Accelerated channel downcutting or headcutting of tributaries do	ue to altered land use.							
Other human-related disturbances within the CA.								
If any items were checked above, then for each row of the table below, assign points (3, 2, or 1 as shown in header) in the last column. However, if you believe the checked items did not cumulatively add significantly more sediment or suspended solids to the AA, then leave the "Os" for the scores in the following rows. To estimate effects, contrast the current condition with the condition if the checked items never occurred or were no longer present.								
	Severe (3 points)	Medium (2 points)	Mild (1 point)					
Erosion in CA:	Extensive evidence, high intensity.*	Potentially (based on high-intensity* land use) or scattered evidence.	Potentially (based on low-intensity* land use) with little or no direct evidence.					
Recentness of significant soil disturbance in the CA:	Current & ongoing.	1-12 months ago.	>1 yr ago.					
Duration of sediment inputs to the wetland:	Frequent and year-round.	Frequent but mostly seasonal.	Infrequent & during high runoff events mainly.					
AA proximity to actual or potential sources:	0 - 15 m.	15-100 m.	In more distant part of contributing area.

Wetland Ecological Condition (EC)			4.22	Moderate		6.67
Wetland Stressors (STR) (higher score means more stress)			3.14	Moderate		3.41
Summary Ratings for Grouped Functions:						
HYDROLOGIC Group (WS)	2.40	Lower	0.42	Lower	6.12	0.50
WATER QUALITY SUPPORT Group (max+avg/2 of SR, PR, NR, CS)	4.75	Moderate	3.46	Lower	7.08	3.81
AQUATIC SUPPORT Group (max+avg/2 of SFS, INV, OE, WC)	4.10	Moderate	2.34	Moderate	4.20	1.56
AQUATIC HABITAT Group (max+avg/2 of FA, FR, AM, WBF, WBN)	1.59	Lower	0.65	Lower	2.82	1.65
TRANSITION HABITAT Group (max+avg/2 of SBM, PH, POL)	7.88	Higher	3.44	Moderate	6.23	3.04
WETLAND CONDITION (EC)			4.22	Moderate		6.67
WETLAND RISK (average of Sensitivity & Stressors)			1.77	Lower		2.87
	NOTE: A scor	e of 0 does not	mean the func	tion or benefit i	s absent from t	ne wetland. It

NOTE: A score of 0 does not mean the function or benefit is absent from the wetland. It means only that this wetland has a capacity that is equal or less than the lowest-scoring one, for that function or benefit, from among the 98 NB calibration wetlands that were assessed previously.

Cover Page: Basic Description of Assessment	WESP-AC version 2
Site Name:	Burchill Wind Energy Project - BB-Trib1-W-02
Investigator Name	Matt Alexander
Date of Field Assessment	11 September 2019
Nearest Town:	Lorneville (west Saint John), New Brunswick
Latitude (decimal degrees)	45.178466
Longitude (decimal degrees)	66.210666
Is a map based on a formal on-site wetland delineation available	Yes
Approximate size of the Assessment Area (AA, in hectares)	0.68
AA as percent of entire wetland (approx.). Attach sketch map if AA is smaller than the entire contiguous wetland.	
What percent (approx.) of the wetland were you able to visit?	100
What percent (approx.) of the AA were you able to visit?	100
Were you able to ask the site owner/manager about any of the questions?	No
Indicate here if you intentionally surveyed for rare plants, calciphile plants, or rare animals	Yes
Have you attended a WESP-AC training session? If so, indicate approximate month & year	Yes, September 2016
How many wetlands have you assessed previously using WESP-AC? (approx.	15
Comments about the site or this WESP-AC assessment (attach extra page if desired)	Old apple orchard adjacent to this wetland next to Burchill Road. Former homestead existed in this area. Twentieth century garbage piles (bottles, cans, car parts, etc.) strewn about the forest.

Investigator: Matt Alexander

Form OF (Office). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Conduct an assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answering many of the questions below will require using these online map viewers:

Google Earth Pro: https://www.google.com/earth/download/gep/agree.html

GeoNB: http://www.snb.ca/geonb1/ and http://www.snb.ca/geonb1/e/apps/apps-E.asp

Geons: http://www.sno.ca/geonol/ and http://www.sno.ca/geonol/e-appsyapps-rc.asp For most wetdands, completing this office data form will require 1-2 hours. For a list of functions to which each question pertains, see bracketed abbreviations in the Definitions/Explanations column. For detailed descriptions of each WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, PO= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity, STR= Stressors.

	Indicators	Condition Choices	Data	Definitions/Explanations
F1	Province	Mark the province in which the AA is located by changing the 0 in the column next to it to a *1". Mark only one.		This determines to which province's calibration wetlands the raw score of any wetland is normalise
		New Brunswick	1	In the function and benefits models, it also triggers the automatic exclusion of indicators for which spatial data exists in a particular province.
		Nova Scotia	0	spatial data exists in a particular province.
		Prince Edward Island	0	
		Newfoundland-Labrador	0	
2	Ponded Area Within 1 km.	The area of surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) within 1 km is:		"Adjacent" means not separated from the AA by a wide expanse (>50 m) of upland (including rox >50 m wide). Include ponded areas likely to be hidden by wetland vegetation. If surface water
		<0.01 hectare (about 10 m x 10 m).	1	extends beyond 1 km, include only the part within 1 km. Do not include tidal areas. Measure the
		0.01 - 0.1 hectare.	0	from aerial imagery using Google Earth Pro (click on Ruler icon in toolbar, then Polygon in pop-up
		0.1 - 1 hectare.	0	menu). With the GeoNB viewer, enable the Wetlands layer, then measure with the Draw & Measi tool after specifying Aerial as the Basemap. However, do not rely entirely on wetland boundaries
		1 to 10 hectares.	0	shown in online wetlands layers. [PH, SBM, WBN]
		10 to 100 hectares.	0	,
		>100 hectares.	0	
3	Ponded Water & Wetland Within 1 km.	The area of wetlands and surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) within is:	n	See definition of adjacent in OF2. If the AA's wetland vegetation extends beyond 1 km, include o the part within 1 km. "Ponded" means not flowing in rivers or streams. [Sens, WBF]
		<0.01 hectare (about 10 m x 10 m).	0	
		0.01 - 0.1 hectare.	0	
		0.1 - 1 hectare.	0	
		1 to 10 hectares.	- 1	
		10 to 100 hectares.	0	
		>100 hectares.	0	
4	Size of Largest Nearby Vegetated Tract or	The largest vegetated patch or corridor that includes the AA's vegetation plus aladjacent upland vegetation that is not lawn, row crops, heavily grazed lands, conifer plantation is:		See definition of adjacent in OF2. Use Google Earth Pro's polygon ruler (as described above). Exclude conifer plantations only if it is obvious that trees were planted in rows. [AM, PH, SBM, Se
	Corridor	<0.01 hectare (about 10 m x 10 m).	0	
		0.01 - 0.1 hectare.	0	1
		0.1 - 1 hectare.	0	1
		1 to 10 hectares.	0	1
		10 to 100 hectares.	0	1
		100 to 1000 hectares.	0	1
		>1000 hectares. [This is nearly always the answer in relatively undeveloped landscapes]	1	
5	Distance to Large Vegetated Tract	The minimum distance from the edge of the AA to the edge of the closest vegetated land (but excluding row crops, lawn, conifer plantation) targer than 375 hectares (about 2 km on a side), is:		To measure distance, use Google Earth Pro (Ruler > Line tool). Or use Draw & Measure tool at GeoNB. The 375-ha criterion is from the Fundy Model Forest Project. [AM, PH, POL, SBM, Sen:
		450 m, and not separated from the 375-ha vegetated area by any width opaved roads, stretches of open water, row crops, bare ground, lawn, or impervious surface. Or the AA itself contains >375 ha of vegetation. [This is often the answer in relatively undeveloped landscaped.]	1 es.]	
		<50 m, but completely separated from the 375-ha vegetated area by those features, and AA does not contain >375 ha of vegetation.	0	
		50-500 m, and not separated.	0	1
		50-500 m, but separated by those features.	0	1
		0.5 - 5 km, and not separated.	0	
		0.5 - 5 km, but separated by those features.	0	1
		None of the above (the closest patches or corridors which are that large are >5 km away).	0	
6	Herbaceous Uniqueness	The AA's vegetation cover is >10% herbaceous* but uplands within 5 km have <10% herbaceous cover. If so, enter "3" and continue to OF7. If not, consider: The AA's vegetation cover is >10% herbaceous* but uplands within 1 km have <10% herbaceous cover. If so enter "2" and continue to OF7. If not, consider: The AA's vegetation cover is >10% herbaceous* but uplands within 100 m of the wetland edge have <10% herbaceous cover. If so, enter "1". "NOTE: Exclude lawns, row crops, heavily grazed lands, forest, shrublands. Include moss as well as grasslike plants in this use of herbaceous vegetation"]	0	For this question only, consider moss to be herbaceous vegetation. Determine the score by view areal imagery in Google Earth flert successively drawing or estimating the boundaries of the bu of 5 km, 1 km, and 100 m radius focused on the center of the AA. Circles of specified radius can drawn in Google Earth Pro by clicking on the Ruler icon, then Circle in the pop-up menu. [AMV, I POLV, SBMV, WBFV, WBNV]
7	Woody Uniqueness	The AA's vegetation cover is >10% woody* but uplands within 5 km have <10% woody cover. If so, enter "3" and continue to OF8. If not,	0	See above. Do not consider conifer plantations to be forest if it is obvious that trees were planted
		consider: The AA's vegetation is >10% woody" but uplands within 1 km have <10% woody cover. If so enter "2" and continue to OF8. If not, consider:		rows. [AMv, PHv, POLv, SBMv]
		The AAT's vegetation is >10% woody* but uplands within 100 m of the wetland edge have <10% woody cover. If so, enter "1" [" NOTE: woody cover = trees & shrubs taller than 1 m.]		
	Local Vegetated Cover	Draw a 5-km radius circle measured from the center of the AA. Ignoring all permanent water in the circle, the percent of the remaining are that is wooded or unmanaged herbaceous vegetation (NOT lawn, row crops, bare or heavily grazed land, clearcuts, or conifer plantations)		In Google Earth, draw the 5 km buffer and then estimate land cover percentages, or do GIS anal of an appropriate land cover layer. [AM, PH, POL, SBM, Sens]

OF11				
	Distance to Nearest Maintained Road	From the center of the AA, the distance to the nearest maintained public road (dirt or paved) is:		Determine this by viewing aerial imagery in Google Earth and measuring with the Ruler>Line tool. use the GeoNB's Draw Line tool. [AM, FAv, FRv, NRv, PH, PU, SBM, STR, WBN]
	Walitalieu Rodu	<10 m.	0	use the George's Draw Line tool. [AW, FAV, FRV, INRV, FR, FU, SDW, STR, WDN]
		10 - 25 m.	0	
		25 - 50 m.	0	
		50 - 100 m. 100 - 500 m.	0	
		>500 m.	0	
OF12	Wildlife Access	Draw a circle of radius of 5 km from the center of the AA. If mammals and amphibians can move from the center of the AA to ALL other separate wetlands and ponds located within the circle without being forced to cross pavement (any width), lawns, bare ground, and/or marrine waters, mark 1 = yes can move to all, 0 = no. Change toblank if there are no other wetlands within 5 km.	0	In NB, enable the Wetlands layer in GeoNB (despite its omissions) to show surrounding wetlands roads, while estimating the location of the 5 km circle (or draw the 5 km circle in Google Earth Pro using the Circle tool and compare). Evaluate using Google Earth, being cautious to search for road hidden under forest canopy. [AM, SBM, STR]
OF13	Distance to Ponded	The distance from the AA center to the closest (but separate) ponded water body visible in GoogleEarth imagery is:		In Google Earth, zoom in closely to examine the surrounding landscape for ponds, lakes, and
	Water	<50 m, and not separated by any width of paved roads, stretches of open water, row crops, lawn, bare ground, or impervious surface.	0	wetlands that appear to be permanently flooded. Enable the GeoNB viewer's Wetlands layer as w [AM, PH, SBM, Sens, WBF, WBN]
		<50 m, but completely separated by those features.	0	
		50-500 m, and not separated. 50-500 m, but separated by those features.	0	
		0.5 - 1 km. and not separated by those readiles.	0	
		0.5 - 1 km, but separated by those features.	- 1	
		None of the above (the closest patches or corridors that large are >1 km away).	0	
OF14	Distance to Large Ponded Water	The distance from the AA center to the closest (but separate)non-lidal body of water that is ponded during most of the year and islarger than 8 hectares during most of a normal year is:		Determine this by viewing aerial imagery in Google Earth. [Sens, WBF, WBN]
		<100 m.	0	-
		100 m - 1 km. 1 - 2 km.	1	
		2-5 km.	0	1
		5-10 km.	0	1
		>10 km.	0	
OF15	Tidal Proximity	The distance from the AA edge to the closesttidal water body (regardless of its salinity) is:		In Google Earth, measure the distance to the ocean (including Bay of Fundy) or tidal river, whichever
		<100 m.	0	is closer. If you need to see how far upriver a river is tidal, see the KMZ file provided with this calculator for NB (NB Headtide). Points shown in those files are only an approximation, so local
		100 m - 1 km.	- 1	information if available may be preferable. [FA, WBF]
		1 - 5 km.	0	
		5-10 km.	0	
		10-40 km.	0	
		>40 km.	0	
OF16	Upland Edge Contact	Select one: The AA has no upland edge (or upland is <1% of perimeter). The AA is entirely surrounded by (& contiguous with) other wetlands or water	. 0	[NR, SBM, Sens]
		1-25% of the AA's perimeter abuts upland (including filled areas). The rest adjoins other wellands or water that is mostly wider than the AA	A 0	
		25-50% of the AA's perimeter abuts upland. The rest adjoins other wetlands or water that is mostly wider than the AA.	0	
		50-75% of the AA's perimeter abuts upland. The rest adjoins other wetlands or water that is mostly wider than the AA.	0	1
		More than 75% of the AA's perimeter abuts upland. Any remainder adjoins other wetlands or water that is mostly wider than the AA.This	- 1	
OE17	Flood Damago from Mon	will be true for most assessments done with WESP-AC. Within 5 km downstream or downslope of the AA (select first true choice):		In the GeoNB map viewer: click on "More" in upper right, then "Flood Information". Expand the me
01 17	tidal Waters			under it by clicking on the arrow to its left and the slider to its right. Uncheck the first (Limits of Dat
		Maps show Flood Zone or Flood Risk areas and there appears to be infrastructure vulnerable to river flooding not caused by tidal storm surges. Maps show Flood Zone or Flood Risk areas, but infrastructure is absent or is not vulnerable to floods from a non-tidal river. In some case	0 s 0	box. Where available, LIDAR imagery can provide finer elevational resolution useful for flood modeling. [WSv]
		levees, upriver dams, or other measures may partly limit damage or risk from smaller events. Maps do not show Flood Zone or Flood Risk areas for no such mapping has been done locally) and there appears to be infrastructure	0	
		vulnerable to river flooding unrelated to tidal storm surges. Maps do not show Flood Zone or Flood Risk areas (or no such mapping has been done locally) and there isno infrastructure vulnerable for river flooding unrelated to tidal storm surges.	1	
OF18	Relative Elevation in Watershed	In Google Earth, enable the Terrain layer (lower left menu) and open the NB_Watersheds KMZ file that accompanies this calculator. Then determine the AA's approximate elevation (bottom right, NOT the "eye alt"). Then move cursor around to determine the watershed's maximum and minimum elevation. Divide the AA's elevation by the (max-min).	0.18	[FA, NR, Sens, SFSv, WCv, WSv]
	Water Quality Sensitive	In Google Earth, open the KMZ file NB_Watershed Protected Area which accompanies this calculator. The AA is within such an area.	_	
OF19	Watershed or Area Degraded Water	Enter 1= yes, 0= no.	0	If an ACCDC report is available for this AA, it also may contain such information. [NRv]
		Enter I = yes, v= no. Sampling indicates a problem with concentrations ofmetals, hydrocarbons, nutrients, or other substances (excluding bacteria, acidic wader, high temperatures) being present at levels harmful to aqualic life or humans, and:	0	May use existing data, or sample those waters as part of this wetland assessment. The problem described above isdownslope from the AA, and: The condition is present within 1 km downslope and connected to the AA by a channel. The condition is present within 5 km downslope and connected to the AA by a channel, or within 1 km but not connected to the AA by a channel. Sampling during both low water periods and times with high runoff (storms, snowmelt) indicates no problems in either the AA or inflowing waters. Data are insufficient (no or inadequate sampling within 1 km, or condition exists only at >1 km upstream)This is the situation for nearly all wetlands in this region. From a topographic map and field observations, estimate the approximate boundaries of the catchment (CA) of the entire wetland of which the AA may be only a part. Then adjust those boundaries if necessary based on your field observations of the surrounding terrain, and/or using procedures described in the Manual. Divide the area of the wetland (not just the AA) by the approximate area of its extentment excluding the area of the wetland (not just the AA) by the approximate area of the catchment excluding the area of the wetland from the area of the wetland (not just the AA) by the approximate area of the catchment excluding the area of the wetland is the wetland include that in the wetland area. The result is:		May use existing data, or sample those waters as part of this wetland assessment. "Harmful" shot be evaluated with regard to current federal or provincial water quality standards. [AM, FA, FR, NR PRv, SRv, STR, WBF, WBN] May use existing data, or monitor waters as part of this wetland assessment. [NRv, PRv, SRv] Topographic maps may be viewed online at the National Atlas of Canada (Toporama):
OF20	Degraded Water Upstream Degraded Water Downstream Wetland as a % of its Contributing Area	Sampling indicates a problem with concentrations ofmetals, hydrocarbons, nutrients, or other substances (excluding bacteria, acidic water, high temperatures) being present at levels harmful to aquatic life or humans, and: The condition is present within the AA. The condition is present in waters within 1 km that flowinto the AA, but has not been documented in the AA liself. Sampling during both low water periods and times with high runoff (storms, snowmelt) indicates no problems in either the AA or inflowing waters. Sampling during both low water periods and times within 1 km, or condition exists only at >1 km upstream)This is the situation for nearly all wetlands in this region. ----	-----------------------	--------------------------------	----------	-----------	----------	------	----

Form F (Field). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Walk for no less than 10 minutes from the wetland edge towards its core, in the part of the AA that is proposed for alteration. If no alteration is proposed, walk in a portion that appears to be most representative of the wetland overall. Walk only where it is safe and legal to do so. Conduct the assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answer these questions primarily based on your onsite observations and interpretations. Do not write in shaded parts of this data form. Answering some questions accurately may require conferring with the landowner or other knowledgable persons and/or reviewing aerial imagery. For most wetlands, completing this field data form will require 1-2 hours on a site. For a list of functions to which each question pertains, see the accompanying Interpretations form. For detailed descriptions of each WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage & Delay, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity, STR= Stressors.

	India-t	Condition States	Deta	Definitions /F
#	Indicators	Condition Choices	Data	Definitions/Explanations
1	Wetland Type	Follow the key below and mark the ONE row that best describes MOST of the vegetated part of the AA:		Ericaceous shrubs are ones in the heather family (Ericaceae). Most have leathery evergreen leaves. They include rhododendron, azalea, swamp laurel, leatherleaf, Labrador tea, and others. Most require
		A. Moss and/or lichen cover more than 25% of the ground. Often dominated by ericaceous shrubs (e.g., Labrador tea) or other acid-tolerant plants (e.g., bog cranberry, pitcher plant, sundew, orchids). Substrate is mostly undecomposed peat. Choose between A1 and A2 and mark the choice with a 1 in their adjoining column. Otherwise go to 8 below.		acidic soil. Although not in the family Ericaceae, sweetgale (<i>Myrica gale</i>) should be counted also. [AM, CS, FA, FR, INV, NR, OE, PH, Sens, SFS, WBF, WBN]
		A1. Surface water is usually absent or, if present, pH is typically <4.5 and conductivity is usually <100 µSicm (<64 ppm TDS). Trees are absent or nearly so. Sedge cover usually sparse or absent but cottongrass and/or lichen cover may be extensive, as well as cloudberry, lingonberry, sheep laurel, and a sedge (Carex rarillora). Wetland surface and surrounding landscape are seldom sloping and wetland often is domed (convex). Inlet and outlet channels are usually absent. If known, pH of peat is <4.0.	0	
		A2. Not A1. Surface water, if present, has pH typically >4.5 and conductivity is usually >100 µS/cm (>64 ppm TDS). Sedge cover is usually extensive, and/or tree and fall shrub cover is extensive. Sometimes at toe of slope or edge of water body. An exit channel is usually present. Wetter than A1 and peat depth may be shallower (<2 m).	0	
		B. Moss and/or lichen cover less than 25% of the ground. Soil is mineral or decomposed organic (muck). Choose between B1 and B2 and mark the choice with a 1 in their adjoining column:		
		B1. Trees and shrubs taller than 1 m comprise more than 25% of the vegetated cover. Surface water is mostly absent or inundates the vegetation only seasonally (e.g., vernal pools or floodplain).	1	
		B2. Not B1. Tree & tall shrubs comprise less than than 25% of the vegetated cover. Vegetation is mostly herbaceous, e.g., cattail, bulrush, burreed, pond lily, horsetail. Surface water may be extensive and fluctuates seasonally, being either persistent or drying up partly or entirely.	0	
A sh nclud adja	ould also include part of e the open water part ad cent " is used synonymo	the AA should include all persistent waters in ponds smaller than 8 hectares (-283 m on a side) that are adjacent to the AA. The the water area of adjacent ponded water larger than 8 ha and adjacent rivers wider than 20 m. Specifically, the AA should facent to welland vegetation and equal in width to the average width of that vegetated zone. Throughout this aform, usly with abutting, adjoining, bordering, contiguous - and means no upland (mammade or natural) completely separates the		
		directly shared edge. Features joined only by a channel are not necessarily considered to be adjacent a large portion of their res do not have to be hydrologically connected in order to be considered adjacent.		
2	Wetland Types - Adjoining or Subordinate	If the AA is smaller than 1 ha, mark all other types that occupy more than 1% of the vegetated AA. If the AA is larger than 1 ha, mark all other types which are within or adjacent to the AA and occupy more than 1 ha, as visible from the AA or as interpreted from aerial imagery. Do not mark again the type marked in F1.		1 hectare is 10,000 sq. m or about 2.5 acres. It could have dimensions of 100 m by 100 m, 1000 m b 10 m, or similar. [AM, INV, SBM, WBF]
		A1. A2.	0	
		B1.	0	
		B2.	0	
3	Woody Height & Form Diversity	Following EACH row below, indicate with a number code the percentage of the living vegetation in the AA which is occupied by that feature (6 if -95%, 5 if 75-95%, 4 if 50-75%, 3 if 25-50%, 2 if 5-25%, 1 if -5%, 0 if none). If the vegetated part of the AA is largely herbaceous (non-woody) vegetation, the percentages should not sum to 100%.		Deciduous shrubs in this region usually include buttonbush, Labrador tea, bayberry (Morella), huckleberry, cranbers, loudoberry, sweetgale, alder, willow, birch, ash, dogwood, and a few others. I you assigned a code of 3 or higher to any of the first four choices and the ground cover beneath the trees/shrubs is <25% moss, then question F1 might be "B1". [CS, INV, NR, PH, POL, SBM, Sens]
		coniferous trees (may include tamarack) taller than 3 m. deciduous trees taller than 3 m.	2	,
		coniferous or ericaceous shrubs or trees 1-3 m tall not directly below the canopy of trees.	1	
		deciduous shrubs or trees 1-3 m tall not directly below the canopy of trees. coniferous or ericaceous shrubs <1 m tall not directly below the canopy of taller vegetation.	4	
		deciduous shrubs or trees <1 m tall (e.g., deciduous seedlings) not directly below the canopy of taller vegetation.	2	
ote :	If none of top 4 rows in	F3 was marked 2 or greater , SKIP to F9 (N fixers).		
	Dominance of Most	Determine which two woody plant species comprise the greatest portion of the low (<3 m) woody cover . Then choose one:		[PH, POL, SBM, Sens]
	Abundant Shrub Species	those species together comprise > 50% of such cover.	1	
1	Woody Diameter	those species together do not comprise > 50% of such cover. 			_	

FieldF form - Non-tidal Page 3 of 5

F37	Interspersion of	During most of the part of the growing season when water is present, the spatial pattern of emergent vegetation within the water is mostly:		[AM, FA, FR, INV, NR, OE, PH, PR, SBM, SR, WBF, WBN]
	Emergents & Open Water	Scattered. More than 30% of such vegetation forms small islands or corridors surrounded by water.	0	
	water	Intermediate.	0	
		Clumped. More than 70% of such vegetation is in bands along the wetland perimeter or is clumped at one or a few sides of the surface water area.	0	
F38	Persistent Deepwater	If the deepest patch of surface water (flowing or ponded) in or directly adjacent to the AA is mostly deeper than 0.5 m for >2 weeks during the growing season, enter "1" and continue. If not, enter "0" and SKIP to F42 (Connection).	0	
F39	Area Non-vegetated Aquatic	During most of the growing season and in waters deeper than 0.5 m, the cover for fish, aquatic invertebrates, and/or amphibians that is		For this question, consider only the wood that is at or above the water surface. Estimates of underwate
	Cover	provided NOT by living vegetation, but by accumulations of dead wood and undercut banks is:		wood based only on observations from terrestrial viewpoints are unreliable so should not be attempted. [AM, FA, FR, INV]
		Little or none. Intermediate.	0	[
F40	Indiated Island	Extensive. The AA contains (or is part of) an island or beaver lodge within a lake, pond, or river, and is isolated from the shore by water depths > 1 m on	0	[WBN]
	Isolated Island	all sides during an average June. The island may be solid, or it may be a floating vegetation mat that is sufficiently large and dense to support a waterbird nest.	Ü	
	Duckweed	At some time of the year, mats of algae and/or duckweed are likely to cover >50% of the AA's otherwise-unshaded water surface, or blanket >50% of the underwater substrate. If true, enter "1" in next column. If untrue or uncertain, enter "0".	0	(EC, PR, WBF)
F42	Channel Connection & Outflow Duration	The most persistent surface water connection (outlet channel or pipe, dilct, or overbank water exchange) between the AA and a downslope stream network is; [Note: If the AA represents only part of a wetland, answer this according to whichever is the least permanent surface connection: the one between the AA and the rest of the wetland, or the surface connection between the wetland and the downslope stream network.] Persistent (surface water flows out for >9 months/year).	0	Consider the connection regardless of whether the surface water is frozen. The "downslope stream network" could consist of ditches, rivers, ponds, or lakes which eventually connect to the ocean. If this cannot be determined while visiting the AA, consult topographic maps perhaps by viewing these off with Toporama (http://atlas.nrcan.gc.ca/toporama/en/index.html) [CS, FA, FR, NR, OE, PR, Sens, SFS SR, WCv, WS]
		Seasonal (surface water flows out for 14 days to 9 months/year, not necessarily consecutive).	1	
		Temporary (surface water flows out for <14 days, not necessarily consecutive). None but maps show a stream network downslope from the AA and within a distance that is less than the AA's length. SKIP to F47 (pH	0	-
		Measurement). No surface water flows out of the wetland except possibly during extreme events (-once per 10 years). Or, water flows only into a wetland,	0	
E42	0	ditch, or lake that lacks an outlet. SKIP to F47 (pH Measurement).	J	Maintan of market model and be a control of the con
F43	Outflow Confinement	During major runoff events, in the places where surface water exits the AA or connected waters nearby, the water: Mostly passes through a pipe, culvert, narrowly breached dike, berm, beaver dam, or other partial obstruction (other than natural topography)	0	"Major runoff events" would include biennial high water caused by storms and/or rapid snowmelt. [CS, NR, OE, PR, Sens, SR, STR, WS]
		that does not appear to drain the wetland artificially during most of the growing season.		
		Leaves through natural exits (channels or diffuse outflow), not mainly through artificial or temporary features. Is exported more quickly than usual due to ditches or pipes within the AA or connected to its outlet, or within 10 m of the AA's edge, which	0	
F44	Tributary Channel	drain the wetland artificially, or water is pumped out of the AA. At least once annually, surface water from a tributary channel that is >100 m long moves into the AA. Or, surface water from a larger		If inlet tributaries cannot be searched for due to inaccessibility of part of the AA, follow suggestions in
		permanent water body adjacent to the AA spills into the AA. If it enters only via a pipe, that pipe must be fed by a mapped stream or lake further upslope. If no, SKIP to F47 (pH Measurement).	0	F42 above. [NRv, PH, PRv, SRv]
F45	Input Water Temperature	Based on lack of shade, water source characteristics, or actual temperature measurements, the inflow is likely to be warmer than surface water in the AA during part of most years. Enter 1= yes, 0= no.	0	[wcv]
F46	Throughflow Resistance	During its travel through the AA at the time of peak annual flow, water arriving in channels: [select only the ONE encountered by most of the incoming water].		[FA, FR, INV, NR, OE, PR, SR, WS]
	resistance	Does not bump into many plant stems as it travels through the AA. Nearly all the water continues to travel in unvegetated (often incised) channels that have minimal contact with wetland vegetation, or through a zone of open water such as an instream pond or lake.	0	
		Bumps into herbaceous vegetation but mostly remains in fairly straight channels.	0	
		Bumps into herbaceous vegetation and mostly spreads throughout, or is in widely meandering, multi-branched, or braided channels.	0	
		Bumps into tree trunks and/or shrub stems but mostly remains in fairly straight channels. Bumps into tree trunks and/or shrub stems and follows a fairly indirect path from entrance to exit (meandering, multi-branched, or braided).	0	
F47	pH Measurement	The pH in most of the AA's surface water:		Preferably, measure this in larger areas of ponded surface water within the AA, or in streams that have
		Was measured, and is: [enter the reading in the column to the right.]		passed through (not along) most of the AA. Unless surface water is completely absent, do not dig holes or make depressions in peat in order to provide water for this measurement. Avoid measuring near
		Was not measured but surface water is present and is darkly tea-coloured. Or if no surface water, then mosses and plants that indicate peatland (e.g., Labrador tea) are prevalent. Enter "1". Neither of above. Enter "1".	0	roads or in puddles formed only by recent rain. [AM, FA, FR, NR, WBF, PH, PR, Sens, WBF, WBN]
F48	TDS and/or	The TDS (total dissolved solids) or conductivity off the AA's surface water is: (select the first true row with information):		See above for measurement guidance. [FR, INV, NRv, PH, PRv, Sens]
	Conductivity	TDS is: [Enter the reading in ppm or mg/L. in the column to the right, if measured, or answer next row.] Conductivity is: [Enter the reading in µS/cm in the column to the right.]		
		Was not measured, but plants that indicate saline conditions cover much of the vegetated AA. Enter *1*.	0	
F49	Beaver Probability	Neither of above Use of the AA by beaver during the past 5 years is (select most applicable ONE):	1	[FA, FR, PH, SBM, Sens, WBF, WBN]
1 47		Evident from direct observation or presence of gnawed limbs, dams, tracks, dens, lodges, or extensive stands of water-killed trees (snags).	0	(ra, ra, ra, sona, sona, wong
		Likely based on known occurrence in the region and proximity to suitable habitat, which may include: (a) a persistent freshwater wetland,	0	
		pond, or lake, or a perennial low or mid-gradient (<10%) channel, and (b) a corridor or multiple stands of hardwood trees and shrubs in vegetated areas near surface water.		
		Unlikely because site characteristics above are deficient, and/or this is a settled area or other area where beaver are routinely removed.	1	
F50	Groundwater Strength of Evidence	Select first applicable choice:		Adhere to these criteria strictly do not use personal judgment based on fen conditions, pH, or other evidence. Consult topographic maps to detect breaks in slope described here. Rust deposits
		Springs are known to be present within the AA, or if groundwater levels have been monitored, that has demonstrated that groundwater primarily discharges to the wetland for longer periods during the year than periods when the wetland recharges the groundwater.	0	associated with groundwater seeps may be most noticeable as orange discoloration in ice formations along streams during early winter. [AM, CS, FA, FR, INV, NR, OE, PH, PRv, SFS, WC, WS]
		Most of the AA has a slope of >5%, or is very close to the base of a natural slope longer than 100 and much steeper than the slope of the AA, AND the pH of surface water, if known, is >5.5. Neither of above is true, although some groundwater may discharge to or flow through the AA. Or groundwater influx is unknown.	0	
F51	Internal Gradient	Neimer or above is true, aimough some groundwater may discharge to or now through the AA. Or groundwater influx is unknown. The gradient along most of the flow path within the AA is:	1	This is not the same as the shoreline slope. It is the elevational difference between the AA's inlet and
		<2% or the AA has no surface water outlet (not even seasonally).	1	outlet, divided by the flow-distance between them and converted to percent. If available, use a clinometer to measure this. Free clinometer apps can be downloaded to smartphones. If the wetland is
		2-5%. 6-10%.	0	large (longer than –1 km), this may be estimated using Google Earth to determine the minimum and maximum elevation within the AA, then dividing by length and multiplying by 100. [CS, NR, OE, PR,
		>10%.	0	SR, WBF, WBN, WS]
Note for		ions: If the AA lacks an upland edge, evaluate based on the AA's entire perimeter, and moving outward into whatever areas are nese questions are best answered by measuring from aerial images.		
		Within a zone extending 30 m laterally from the AA's edge with upland and/or other wetlands, the percentage that contains perennial		[AM, FA, FR, INV, NRv, PH, POL, PRv, SBM, Sens, SRv, STR, WBN]

Waterbird Feeding Habitat (WBF)	0.00	Lower	0.00	Lower	0.00	0.00
Waterbird Nesting Habitat (WBN)	0.00	Lower	0.00	Lower	0.00	0.00
Songbird, Raptor, & Mammal Habitat (SBM)	6.29	Moderate	5.00	Moderate	5.21	5.00
Pollinator Habitat (POL)	7.50	Moderate	0.00	Lower	6.04	0.00
Native Plant Habitat (PH)	5.71	Moderate	4.32	Moderate	5.39	3.75
Public Use & Recognition (PU)			2.26	Lower		1.94
Wetland Sensitivity (Sens)			1.51	Lower		2.66
Wetland Ecological Condition (EC)			7.83	Higher		8.75
Wetland Stressors (STR) (higher score means more stress)			0.45	Lower		2.42
Summary Ratings for Grouped Functions:						
HYDROLOGIC Group (WS)	1.88	Lower	0.37	Lower	5.32	0.45
WATER QUALITY SUPPORT Group (max+avg/2 of SR, PR, NR, CS)	6.24	Higher	4.91	Moderate	7.67	5.13
AQUATIC SUPPORT Group (max+avg/2 of SFS, INV, OE, WC)	6.01	Moderate	2.45	Moderate	4.98	1.63
AQUATIC HABITAT Group (max+avg/2 of FA, FR, AM, WBF, WBN)	1.62	Lower	1.30	Lower	2.83	2.04
TRANSITION HABITAT Group (max+avg/2 of SBM, PH, POL)	7.00	Moderate	4.05	Moderate	5.79	3.96
WETLAND CONDITION (EC)			7.83	Higher		8.75
WETLAND RISK (average of Sensitivity & Stressors)			0.98	Lower		2.54
	NOTE: A scor	e of 0 does not	mean the func	tion or benefit i	s absent from t	he wetland It

NOTE: A score of 0 does not mean the function or benefit is absent from the wetland. It means only that this wetland has a capacity that is equal or less than the lowest-scoring one, for that function or benefit, from among the 98 NB calibration wetlands that were assessed previously.

Cover Page: Basic Description of Assessment	WESP-AC version 2
Site Name:	Burchill Wind Energy Project - BB-Trib5-W-02
Investigator Name:	Matt Alexander
Date of Field Assessment:	17 September 2019
Nearest Town:	Lorneville (west Saint John), New Brunswick
Latitude (decimal degrees):	45.174268
Longitude (decimal degrees):	66.206582
Is a map based on a formal on-site wetland delineation available?	Yes
Approximate size of the Assessment Area (AA, in hectares):	0.71
AA as percent of entire wetland (approx.). Attach sketch map if AA is smaller than the entire contiguous wetland.	75
What percent (approx.) of the wetland were you able to visit?	75
What percent (approx.) of the AA were you able to visit?	100
Were you able to ask the site owner/manager about any of the questions?	No
Indicate here if you intentionally surveyed for rare plants, calciphile plants, or rare animals	Yes
Have you attended a WESP-AC training session? If so, indicate approximate month & year	Yes, September 2016
How many wetlands have you assessed previously using WESP-AC? (approx.)	15
Comments about the site or this WESP-AC assessment (attach extra page if desired):	Catches runoff from Burchill Road.

Investigator: Matt Alexander

Form OF (Office). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Conduct an assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answering many of the questions below will require using these online map viewers:

Google Earth Pro: https://www.google.com/earth/download/gep/agree.html

GeoNB: http://www.snb.ca/geonb1/ and http://www.snb.ca/geonb1/e/apps/apps-E.asp

Geons: http://www.sno.ca/geonol/ and http://www.sno.ca/geonol/e-appsyapps-rc.aspy
For most wetlands, completing this office data form will require 1-2 hours. For a list of functions to which each question pertains, see bracketed abbreviations in the Definitions/Explanations column. For detailed descriptions of each
WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus
Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding
Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity,
STR= Stressors.

)F1	Indicators	Condition Choices	Data	Definitions/Explanations
	Province	Mark the province in which the AA is located by changing the 0 in the column next to it to a *1". Mark only one.		This determines to which province's calibration wetlands the raw score of any wetland is normalise
		New Brunswick	1	In the function and benefits models, it also triggers the automatic exclusion of indicators for which spatial data exists in a particular province.
		Nova Scotia	0	spatial data exists in a particular province.
		Prince Edward Island	0	
		Newfoundland-Labrador	0	
2	Ponded Area Within 1 km.	The area of surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) within 1 km is:		"Adjacent" means not separated from the AA by a wide expanse (>50 m) of upland (including roa >50 m wide). Include ponded areas likely to be hidden by wetland vegetation. If surface water
		<0.01 hectare (about 10 m x 10 m).	- 1	extends beyond 1 km, include only the part within 1 km. Do not include tidal areas. Measure the
		0.01 - 0.1 hectare.	0	from aerial imagery using Google Earth Pro (click on Ruler icon in toolbar, then Polygon in pop-up
		0.1 - 1 hectare.	0	menu). With the GeoNB viewer, enable the Wetlands layer, then measure with the Draw & Measu tool after specifying Aerial as the Basemap. However, do not rely entirely on wetland boundaries
		1 to 10 hectares.	0	shown in online wetlands layers. [PH, SBM, WBN]
		10 to 100 hectares.	0	
		>100 hectares.	0	1
3	Ponded Water & Wetland Within 1 km.	The area of wetlands and surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) within twis:	n	See definition of adjacent in OF2. If the AA's wetland vegetation extends beyond 1 km, include on the part within 1 km. "Ponded" means not flowing in rivers or streams. [Sens, WBF]
		< 0.01 hectare (about 10 m x 10 m).	0	
		0.01 - 0.1 hectare.	0	1
		0.1 - 1 hectare.	1	
		1 to 10 hectares.	0	
		10 to 100 hectares.	0	1
		>100 hectares.	0	1
4	Size of Largest Nearby Vegetated Tract or	The largest vegetated patch or corridor that includes the AA's vegetation plus aladjacent upland vegetation that is not lawn, row crops, heavily grazed lands, conifer plantation is:		See definition of adjacent in OF2. Use Google Earth Pro's polygon ruler (as described above). Exclude conifer plantations only if it is obvious that trees were planted in rows. [AM, PH, SBM, Se
	Corridor	< 0.01 hectare (about 10 m x 10 m).	0	
		0.01 - 0.1 hectare.	0	1
		0.1 - 1 hectare.	0	1
		1 to 10 hectares.	0	1
		10 to 100 hectares.	0	1
		100 to 1000 hectares.	0	
		>1000 hectares. [This is nearly always the answer in relatively undeveloped landscapes]	1	
5	Distance to Large Vegetated Tract	The minimum distance from theedge of the AA to the edge of the closest vegetated land (but excluding row crops, lawn, conifer plantation) larger than 375 hectares (about 2 km on a side), is:		To measure distance, use Google Earth Pro (Ruler > Line tool). Or use Draw & Measure tool at GeoNB. The 375-ha criterion is from the Fundy Model Forest Project. [AM, PH, POL, SBM, Sens
		<50 m, and not separated from the 375-ha vegetated area by any width ofpaved roads, stretches of open water, row crops, bare ground, lawn, or impervious surface. Or the AA itself contains >375 ha of vegetation. [This is often the answer in relatively undeveloped landscape	1 s.]	
		< 50 m, but completely separated from the 375-ha vegetated area by those features, and AA does not contain > 375 ha of vegetation.	0	
		50-500 m, and not separated.	0	1
		50-500 m, but separated by those features.	0	i
		0.5 - 5 km, and not separated.	0	
		0.5 - 5 km, but separated by those features.	0	1
		None of the above (the closest patches or corridors which are that large are >5 km away).	0	
-6	Herbaceous Uniqueness	The AA's vegetation cover is >10% herbaceous* but uplands within 5 km have <10% herbaceous cover. If so, enter "3" and continue to OF7. If not, consider: The AA's vegetation cover is >10% herbaceous* but uplands within 1 km have <10% herbaceous cover. If so enter "2" and continue to OF7. If not, consider: The AA's vegetation cover is >10% herbaceous* but uplands within 100 m of the wetland edge have <10% herbaceous cover. If so, enter "1". If NOTE: Exclude lawns, row crops, heavily grazed lands, forest, shrublands. Include moss as well as grasslike plants in this use of herbaceous vegetation"]	3	For this question only, consider moss to be herbaceous vegetation. Determine the score by view areal imagery in Google Earth after successively drawing or estimating the boundaries of the but of 5 km, 1 km, and 100 m radius focused on the center of the AA. Circles of specified radius can drawn in Google Earth Pro by clicking on the Ruler icon, then Circle in the pop-up menu. [AMv, F POLv, SBMv, WBFv, WBNv]
7	Woody Uniqueness	The AA's vegetation cover is >10% woody* but uplands within 5 km have <10% woody cover. If so, enter "3" and continue to OF8. If not,	0	See above. Do not consider conifer plantations to be forest if it is obvious that trees were planted
		consider: The AAI's vegetation is >10% woody" but uplands within 1 km have <10% woody cover. If so enter "2" and continue to OF8. If not, consider:		rows. [AMv, PHv, POLv, SBMv]
		The AA's vegetation is >10% woody* but uplands within 100 m of the wetland edge have <10% woody cover. If so, enter "1"		
		[* NOTE: woody cover = trees & shrubs taller than 1 m.]		
8	Local Vegetated Cover Percentage	["NOIL: woody cover = frees & strubs lailer than 1 m.] Draw a 5-km radius circle measured from the center of the AA. Ignoring all permanent water in the circle, the percent of the remaining are that is wooded or unmanaged herbaceous vegetation (NOT lawn, row crops, bare or heavily grazed land, clearcuts, or conifer plantations; is:		In Google Earth, draw the 5 km buffer and then estimate land cover percentages, or do GIS analy of an appropriate land cover layer. Settlements (click on Place Names) in menu) or other areas not close to mapped settlements but

OF11	F11 Distance to Nearest From the center of the AA, the distance to the nearest maintained public road (dirt or paved) is:			Determine this by viewing aerial imagery in Google Earth and measuring with the Ruler>Line tool. Or
	Maintained Road	<10 m.	0	use the GeoNB's Draw Line tool. [AM, FAv, FRv, NRv, PH, PU, SBM, STR, WBN]
		10 - 25 m.	- 1	
		25 - 50 m.	0	
		50 - 100 m.	0	
		100 - 500 m. >500 m.	0	
OF12	Wildlife Access	Draw a circle of radius of 5 km from the center of the AA. If mammals and amphibians can move from the center of the AA to ALL other	U	In NB, enable the Wetlands layer in GeoNB (despite its omissions) to show surrounding wetlands an
01.12	Trialio / tooss	separate wetlands and ponds located within the circle without being forced to cross pavement (any width), lawns, bare ground, and/or marine waters, mark 1 = yes can move to all, 0 = no. Change toblank if there are no other wetlands within 5 km.	0	roads, while estimating the location of the 5 km circle (or draw the 5 km circle in Google Earth Pro using the Circle tool and compare). Evaluate using Google Earth, being cautious to search for roads hidden under forest canopy. [AM, SBM, STR]
OF13		The distance from the AA center to the closest (but separate) ponded water body visible in GoogleEarth imagery is:		in Google Earth, zoom in closely to examine the surrounding landscape for ponds, lakes, and
	Water	<50 m, and not separated by any width of paved roads, stretches of open water, row crops, lawn, bare ground, or impervious surface.	0	wellands that appear to be permanently flooded. Enable the GeoNB viewer's Wetlands layer as wel [AM, PH, SBM, Sens, WBF, WBN]
		<50 m, but completely separated by those features.	0	
		50-500 m, and not separated.	0	
		50-500 m, but separated by those features. 0.5 - 1 km. and not separated.	0	
		0.5 - 1 km, but separated by those features.	1	
		None of the above (the closest patches or corridors that large are >1 km away).	0	
OF14		The distance from the AA center to the closest (but separate)non-tidal body of water that is ponded during most of the year and islarger		Determine this by viewing aerial imagery in Google Earth. [Sens, WBF, WBN]
	Ponded Water	than 8 hectares during most of a normal year is:		
		<100 m. 100 m - 1 km.	0	
		1 - 2 km.	0	
		2-5 km.	1	
		5-10 km.	0	
		>10 km.	0	
OF15	Tidal Proximity	The distance from the AA edge to the closesttidal water body (regardless of its salinity) is:		In Google Earth, measure the distance to the ocean (including Bay of Fundy) or tidal river, whichever
		<100 m.	0	is closer. If you need to see how far upriver a river is tidal, see the KMZ file provided with this calculator for NB (NB Headtide). Points shown in those files are only an approximation, so local
		100 m - 1 km.	1	information if available may be preferable. [FA, WBF]
		1 - 5 km.	0	
		5-10 km.	0	
		10-40 km.	0	
OF16	Upland Edge Contact	Select one:	0	[NR, SBM, Sens]
		The AA has no upland edge (or upland is <1% of perimeter). The AA is entirely surrounded by (& contiguous with) other wetlands or water	. 0	,,
		1-25% of the AA's perimeter abuts upland (including filled areas). The rest adjoins other wetlands or water that is mostly wider than the AA	0	
		25-50% of the AA's perimeter abuts upland. The rest adjoins other wetlands or water that is mostly wider than the AA.	0	
		50-75% of the AA's perimeter abuts upland. The rest adjoins other wetlands or water that is mostly wider than the AA.	0	
		More than 75% of the AA's perimeter abuts upland. Any remainder adjoins other wetlands or water that is mostly wider than the AA.This will be true for most assessments done with WESP-AC.	1	
OF17	Flood Damage from Non-			In the GeoNB map viewer: click on "More" in upper right, then "Flood Information". Expand the menu
	tidal Waters	Maps show Flood Zone or Flood Risk areas and there appears to be infrastructure vulnerable to river flooding not caused by tidal storm surges.	0	under it by clicking on the arrow to its left and the slider to its right. Uncheck the first (Limits of Data) box. Where available, LiDAR imagery can provide finer elevational resolution useful for flood
		Maps show Flood Zone or Flood Risk areas, but infrastructure is absent or is not vulnerable to floods from a non-tidal river. In some cases evees, upriver dams, or other measures may partly limit damage or risk from smaller events.	0	modeling. [WSv]
		Maps do not show Flood Zone or Flood Risk areas (or no such mapping has been done locally) and there appears to be infrastructure vulnerable to river flooding unrelated to tidal storm surges.	0	
OF18	Relative Elevation in	Maps do not show Flood Zone or Flood Risk areas (or no such mapping has been done locally) and there ino infrastructure vulnerable to river flooding unrelated to tidal storm surges. In Google Earth, enable the Terrain layer (lower left menu) and open the NB_Watersheds KMZ file that accompanies this calculator. Then	-	[FA, NR, Sens, SFSv, WCv, WSv]
	Watershed	determine the AA's approximate elevation (bottom right, NOT the "eye alt"). Then move cursor around to determine the watershed's maximum and minimum elevation. Divide the AA's elevation by the (max-min).	0.16	
DF19	Water Quality Sensitive Watershed or Area	In Google Earth, open the KMZ file NB_Watershed Protected Area which accompanies this calculator. The AA is within such an area. Enter 1 = yes, 0 = no.	0	If an ACCDC report is available for this AA, it also may contain such information. [NRv]
OF20	Degraded Water Upstream	Sampling indicates a problem with concentrations ofmetals, hydrocarbons, nutrients, or other substances (excluding bacteria, acidic water, high temperatures) being present at levels harmful to aquatic life or humans, and:		May use existing data, or sample those waters as part of this wetland assessment. "Harmful" should be evaluated with regard to current federal or provincial water quality standards. [AM, FA, FR, NRv,
		The condition is present within the AA.	0	PRv, SRv, STR, WBF, WBN]
		The condition is present in waters within 1 km that flowinto the AA, but has not been documented in the AA itself.	0	
		Sampling during both low water periods and times with high runoff (storms, snowmelt) indicates no problems in either the AA or inflowing	0	
		Walters. Data are insufficient (no or inadequate campling within 1 km, or condition exists only at > 1 km unchroam/This is the cituation for nearly.	1	
		Data are insufficient (no or inadequate sampling within 1 km, or condition exists only at >1 km upstream)This is the situation for nearly all wetlands in this region.		
OF21	Degraded Water	The problem described above is downslope from the AA, and:		May use existing data, or monitor waters as part of this wetland assessment. [NRv, PRv, SRv]
	Downstream	The condition is present within 1 km downslope and connected to the AA by a channel.	0	
		The condition is present within 5 km downslope and connected to the AA by a channel, or within 1 km but not connected to the AA by a	0	1
		channel. Sampling during both low water periods and times with high runoff (storms, snowmelt) indicates no problems in either the AA or inflowing	0	
		waters. Data are insufficient (no or inadequate sampling within 1 km, or condition exists only at >1 km upstream)This is the situation for nearly all wetlands in this region.	1	
OF22	Wetland as a % of Its Contributing Area (Catchment)	From a topographic map and field observations, estimate the approximate boundaries of the catchment (CA) of the entire wetland of which the AA may be only a part. Then adjust those boundaries if necessary based on your field observations of the surrounding terrain, and/or busing procedures described in the Manual. Divide the area of the wetland (not just the AA) by the approximate area of its catchment excluding the area of the wetland itself. When doing the calculation, if ponded water is adjacent to the wetland, include that in the wetland area. The result is:		Topographic maps may be viewed online at the National Atlas of Canada (Toporama): http://atlas.gc.ca/toporama/en/index.html [NR, PR, Sens, SR, WS]
		<0.01, or catchment size unknown due to stormwater pipes that collect water from an indeterminate area.	0	
		0.01 to 0.1.	1	
		0.1 to 1. >1 (wetland is larger than its catchment (e.g., wetland with flat surrounding terrain and no inlet, or is entirely isolated by dikes, or is a raised	0	
OF23	Unvegetated Surface in	In the proportion of the AA's contributing area (measured to no more than 1000 m upslope) that is comprised of buildings, roads, parking lots.		[FA, INV, NRv, PRv, SRv, STR, WCv, WSv]
	the Contributing Area	other pavement, exposed bedrock, landslides, and other mostly-bare surface is about : <10%.	1	*
		10 to 25%.	0	
		>25%.	0	

OF24	Transport From Upslope	A relatively large proportion of the precipitation that falls farther upslope in the CA reaches this wetland quickly as runoff (surface water), as		[NRv, PRv, SRv, WSv]
		indicated by the following:		
		(a) input channel is present, (b) input channels have been straightened,		
		(c) upslope wetlands have been ditched extensively,		
		(d) land cover is mostly non-forest, (e) CA slopes are steep, and/or		
		(f) most CA soils are shallow (bedrock near surface) and/or have high runoff coefficients.		
		This statement is:		
		Mostly true.	0	
		Somewhat true.	1	
		Mostly untrue.	0	
OF25	Aspect	The overland flow direction of most surface water (in streams, rivers, or runoff) that enters the AA is:		[AM, NR, SFS, WC, WS]
		Northward (N, NE). north-facing contributing area.	0	
		Southward (S, SW), south-facing contributing area.	0	
		Other (E, SE, W, NW), or no detectable uphill slope or input channel (flat).	- 1	
OF26	Internal Flow Distance	The horizontal flow distance from the wetland's inlet to outlet is:		Identify inlets and outlets, if any, from topographic maps (use elevations to determine which are inlet
	(Path Length)	<10 m.	0	and which are outlets) and augment by field inspection. [NR, OE, PR, SR, WS]
		10 - 50 m.	0	
		50 - 100 m.	0	
		100 - 1000 m.	- 1	
		1- 2 km.	0	
OFCE		>2 km, or wetland lacks an inlet and outlet.	0	
	Growing Degree Days	In Google Earth, open the KMZ file that accompanies this calculator, called NB-PEL_GrowingDegreeDays. Place your cursor over the AA and left-click. From the pop-up, enter the GRIDCODE in the next column.	2314	This layer was provided by Dr. Dan McKenney of the Canadian Forest Service [AM, CS, FR, INV, NR, OE, PH, PR, Sens, SR, WBF, WCv, WS]
UF28	Fish Access or Use	According to agency biologists and/or your own observations, the AA. [Nark just the first choice that is true.]:		Regarding the last choice, if uncertain if an AA is fishless, consider the possibility its waters have be stocked. In NB, the list of stocked waters is at:
		Is known to support rearing and/or spawning by Atlantic salmon or other anadromous species or eels. In NB, consult Figure A-2 in	0	http://www2.gnb.ca/content/gnb/en/departments/erd/natural_resources/content/fish/content/Stocked
		Appendix A of the Manual. Contact local fishery biologists, review the ACCDC report, and visit these websites: http://www.salmonatlas.com/atlanticsalmon/canada-east/index.1.html http://atlanticsalmonfederation.org/rivers/introduction.html	l	aters.html
		Has not been documented to support Atlantic salmon rearing and/or spawning, but is connected to nearby waters likely to contain Atlantic	0	[AM, FA, FR, INV, WBF, WBN]
		Has not been documented to support Atlantic salmon realing and/or spawning, but is connected to hearby waters likely to contain Atlantic salmon or other anadromous species or eels and is probably accessed by those during some conditions.	U	
		Is probably is not accessed by any anadromous fish species but is known or likely to haveother fish at least seasonally.	0	
		Is known or likely to be fishless (e.g., too small, dry, and/or not accessible even temporarily, and not stocked).	- 1	
OF29	Species of Conservation	Within the past 10 years, in the AA (or in its adjoining waters or wetland), qualified observers have documented mark all applicable:		Request information from ACCDC and/or conduct your own survey at an appropriate season using a
	Concern			approved protocol. For birds, also check eBird.org. [AMv, EC, PHv, POLv, SBMv, Sens, WBFv, WBNv]
		Presence of one or more of the plant species listed in the Plants_Rare worksheet of the accompanying Supplnfo file, or the AA is within a mapped Atlantic Coastal Plain Flora Buffer	0	WDIWJ

----	-------------------	--------------------------------	---------------	----------------	----

Form F (Field). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Walk for no less than 10 minutes from the wetland edge towards its core, in the part of the AA that is proposed for alteration. If no alteration is proposed, walk in a portion that appears to be most representative of the wetland overall. Walk only where it is safe and legal to do so. Conduct the assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answer these questions primarily based on your onsite observations and interpretations. Do not write in shaded parts of this data form. Answering some questions accurately may require conferring with the landowner or other knowledgable persons and/or reviewing aerial imagery. For most wetlands, completing this field data form will require 1-2 hours on a site. For a list of functions to which each question pertains, see the accompanying Interpretations form. For detailed descriptions of each WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage & Delay, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity, STR= Stressors.

ш	to die	Condition of t	<u> </u>	Definitions In 1 11
#	Indicators	Condition Choices	Data	Definitions/Explanations
1	Wetland Type	Follow the key below and mark the ONE row that best describes MOST of the vegetated part of the AA:		Ericaceous shrubs are ones in the heather family (Ericaceae). Most have leathery evergreen leaves. They include rhododendron, azalea, swamp laurel, leatherleaf, Labrador tea, and others. Most require
		A. Moss and/or lichen cover more than 25% of the ground. Often dominated by ericaceous shrubs (e.g., Labrador tea) or other acid-tolerant plants (e.g., bog cranberry, pitcher plant, sundew, orchids). Substrate is mostly undecomposed peat. Choose between A1 and A2 and mark the choice with a 1 in their adjoining column. Otherwise go to B below.		acidic soil. Although not in the family Ericaceae, sweetgale (<i>Myrica gale</i>) should be counted also. [AM, CS, FA, FR, INV, NR, OE, PH, Sens, SFS, WBF, WBN]
		A1. Surface water is usually absent or, if present, pH is typically <4.5 and conductivity is usually <100 µS/cm (<64 ppm TDS). Trees are absent or nearly so. Sedge cover usually sparse or absent but cottongrass and/or lichen cover may be extensive, as well as cloudberry, lingonberry, sheep laurel, and a sedge (Carex rariflora). Welfand surface and surrounding landscape are seldom sloping and welfand often is domed (convex). Inlet and outlet channels are usually absent. If known, pH of peat is <4.0.	0	
		A2. Not A1. Surface water, if present, has pH typically >4.5 and conductivity is usually >100 µS/cm (>64 ppm TDS). Sedge cover is usually extensive, and/or tree and fall shrub cover is extensive. Sometimes at toe of slope or edge of water body. An exit channel is usually present. Wetter than A1 and peat depth may be shallower (<2 m).	0	
		B. Moss and/or lichen cover less than 25% of the ground. Soil is mineral or decomposed organic (muck). Choose between B1 and B2 and mark the choice with a 1 in their adjoining column:		
		B1. Trees and shrubs taller than 1 m comprise more than 25% of the vegetated cover. Surface water is mostly absent or inundates the vegetation only seasonally (e.g., vernal pools or floodplain).	1	
		B2. Not B1. Tree & tall shrubs comprise less than than 25% of the vegetated cover. Vegetation is mostly herbaceous, e.g., cattail, bulrush, burreed, pond lily, horsetail. Surface water may be extensive and fluctuates seasonally, being either persistent or drying up partly or entirely.	0	
IA sh ncludi adja lescri	ould also include part of it the open water part adj cent " is used synonymou bed features along their it	The AA should include all persistent waters in ponds smaller than 8 hectares (-283 m on a side) that are adjacent to the AA. The the water area of adjacent ponded water larger than 8 ha and adjacent rivers wider than 20 m. Specifically, the AA should lacent to wetland vegetation and equal in width to the average width of that vegetated zone. Throughout this dat form, usly with abutting, adjoining, bordering, contiguous and means no upland (manmade or natural) completely separates the directly shared edge. Features joined only by a channel are not necessarily considered to be adjacent a large portion of their res do not have to be hydrologically connected in order to be considered adjacent.		
2	Wetland Types - Adjoining or Subordinate	If the AA is smaller than 1 ha, mark all other types that occupy more than 1% of the vegetated AA. If the AA is larger than 1 ha, mark all other types which are within or adjacent to the AA and occupy more than 1 ha, as visible from the AA or as interpreted from aerial imagery. Do not mark again the type marked in F1.		1 hectare is 10,000 sq. m or about 2.5 acres. It could have dimensions of 100 m by 100 m, 1000 m by 10 m, or similar. [AM, INV, SBM, WBF]
		A1. A2.	0	
		B1.	0	
2	Mandallaicht & Farm	B2. Following EACH row below, indicate with a number code the percentage of the living vegetation in the AA which is occupied by that feature (6	0	Deciduous shrubs in this region usually include buttonbush, Labrador tea, bayberry (Morella),
3	Woody Height & Form Diversity	if >95%, 5 if 75-95%, 4 if 50-75%, 3 if 25-50%, 2 if 5-25%, 1 if <5%, 0 if none). If the vegelated part of the AA is largely herbaceous (non-woody) vegetation, these percentages should not sum to 100%.		Decladous stricts in this region losality include distinctions, Labriator lea, varyerity (worker), huckleberry, cranberry, cloudberry, sweetgale, alder, willow, birch, ash, dogwood, and a few others. If you assigned a code of 3 or higher to any of the first four choices and the ground cover beneath the threes/shrubs is <25% moss, then question F1 might be "B1". [CS, INV, NR, PH, POL, SBM, Sens]
		coniferous trees (may include tamarack) taller than 3 m. deciduous trees taller than 3 m.	2	
		coniferous or ericaceous shrubs or trees 1-3 m tall not directly below the canopy of trees.	3	
		deciduous shrubs or trees 1-3 m tall not directly below the canopy of trees. coniferous or ericaceous shrubs <1 m tall not directly below the canopy of taller vegetation.	3	
		deciduous shrubs or trees <1 m tall (e.g., deciduous seedlings) not directly below the canopy of taller vegetation.	1	
lote :		F3 was marked 2 or greater , SKIP to F9 (N fixers).		
4	Dominance of Most Abundant Shrub	Determine which two woody plant species comprise the greatest portion of the low (<3 m) woody cover . Then choose one:		[PH, POL, SBM, Sens]
	Species	those species together comprise > 50% of such cover. those species together do not comprise > 50% of such cover.	0	
5	Woody Diameter Classes	Mark ALL the types that comprise >5% of the woody canopy cover in the AA or >5% of the wooded areas (if any) along its upland edge (perimeter). The edge should include only the trees whose canopies extend into the AA.		Estimate the diameters at chest height. If small-diameter trees are overtopped (shaded) by larger ones, visualise a "subcanopy" at the average height of the smaller-dbh trees, to serve as a basis for t
		coniferous, 1-9 cm diameter and >1 m tall. broad-leaved deciduous 1-9 cm diameter and >1 m tall.	0	minimum 5% canopy requirement in this question. The trees and shrubs need not be wetland specie: [AM, CS, POL, SBM, Sens, WBN]
		coniferous, 10-19 cm diameter.	1	
		broad-leaved deciduous 10-19 cm diameter.	0	
		coniferous, 20-40 cm diameter. broad-leaved deciduous 20-40 cm diameter.	1	
		coniferous, >40 cm diameter.	1	
	Height Class	broad-leaved deciduous >40 cm diameter. Follow the key below and mark the ONE row that best describes MOST of the AA:	0	[AM, INV, NR, PH, SBM, Sens]
6	Interspersion	A. Neither the vegetation taller than 1 m nor the vegetation shorter than that comprise >70% of the vegetated part of the AA. They each		p , ,
6		comprise 30-70%. Choose between A1 and A2 and mark the choice with a 1 in the adjoining column. Otherwise go to B below.		
6		A1. The two height classes are mostly scattered and intermixed throughout the AA.	1	
6		A1. The two height classes are mostly scattered and intermixed throughout the AA. A2. Not A1. The two height classes are mostly in separate zones or bands, or in proportionately large clumps. B. Either the vegetation shorter than 1 m comprises > 70% of the vegetated part of the AA, or the vegetation taller than that does. One size	0	
6		A1. The two height classes are mostly scattered and intermixed throughout the AA. A2. Not A1. The two height classes are mostly in separate zones or bands, or in proportionately large clumps. B. Either the vegetation shorter than 1 m comprises > 70% of the vegetated part of the AA, or the vegetation taller than that does. One size class might even be totally absent. Choose between B1 and B2 and mark the choice with a 1 in the adjoining column: B1. The less prevalent height class is mostly scattered and intermixed within the prevalent one.		
7	Large Snags (Dead	A1. The two height classes are mostly scattered and intermixed throughout the AA. A2. Not A1. The two height classes are mostly in separate zones or bands, or in proportionately large clumps. B. F39	Area Non-vegetated Aquatic	During most of the growing season and in waters deeper than 0.5 m, the cover for fish, aquatic invertebrates, and/or amphibians that is		For this question, consider only the wood that is at or above the water surface. Estimates of underwater
	Cover	provided NOT by living vegetation, but by accumulations of dead wood and undercut banks is:		wood based only on observations from terrestrial viewpoints are unreliable so should not be attempted. [AM, FA, FR, INV]
		Little or none. Intermediate.	0	[Pag, 17, 115, 114]
F40		Extensive.	0	Survey
F40	Isolated Island	The AA contains (or is part of) an island or beaver lodge within a lake, pond, or river, and is isolated from the shore by water depths > 1 m on all sides during an average June. The island may be solid, or it may be a floating vegetation mat that is sufficiently large and dense to support a waterbird nest.	0	[WBN]
	Duckweed	At some time of the year, mats of algae and/or duckweed are likely to cover >50% of the AA's otherwise-unshaded water surface, or blanket >50% of the underwater substrate. If true, enter "1" in next column. If untrue or uncertain, enter "0".	0	[EC, PR, WBF]
F42	Channel Connection & Outflow Duration	The most persistent surface water connection (outlet channel or pipe, ditch, or overbank water exchange) between the AA and a downslope stream network is: [Note: If the AA represents only part of a welland, answer this according to whichever is the least permanent surface connection: the one between the AA and the rest of the wetland, or the surface connection between the wetland and the downslope stream network.] Persistent (surface water flows out for >9 months/year).	0	Consider the connection regardless of whether the surface water is frozen. The "downslope stream network" could consist of ditches, rivers, ponds, or lakes which eventually connect to the ocean. If this cannot be determined while visiting the AA, consult topographic maps perhaps by viewing these online with Toporama (http://atlas.nrcan.gc.ca/toporama/en/index.html) [CS, FA, FR, NR, OE, PR, Sens, SFS SR, WCv, WS]
		Seasonal (surface water flows out for 14 days to 9 months/year, not necessarily consecutive).	1	
		Temporary (surface water flows out for <14 days, not necessarily consecutive). None but maps show a stream network downslope from the AA and within a distance that is less than the AA's length. SKIP to F47 (pH	0	
		Measurement).		
		No surface water flows out of the wetland except possibly during extreme events (<once (ph="" 10="" a="" an="" dlich,="" f47="" flows="" into="" lacks="" lake="" measurement).<="" only="" or="" or,="" outlet.="" per="" skip="" td="" that="" to="" water="" wetland,="" years).=""><td>0</td><td></td></once>	0	
F43	Outflow Confinement	During major runoff events, in the places where surface water exits the AA or connected waters nearby, the water: Medity passes through a pine subject passes where surface water exits the AA or connected waters nearby, the water:	^	"Major runoff events" would include biennial high water caused by storms and/or rapid snowmelt. [CS, NR, OE, PR, Sens, SR, STR, WS]
		Mostly passes through a pipe, culvert, narrowly breached dike, berm, beaver dam, or other partial obstruction (other than natural topography) that does not appear to drain the wetland artificially during most of the growing season.	0	
		Leaves through natural exits (channels or diffuse outflow), not mainly through artificial or temporary features. Is exported more quickly than usual due to ditches or pipes within the AA or connected to its outlet, or within 10 m of the AA's edge, which	0	
F44	Tributary Channel	drain the welland artificially, or water is pumped out of the AA. At least once annually, surface water from a tributary channel that is >100 m long moves into the AA. Or, surface water from a larger		If inlet tributaries cannot be searched for due to inaccessibility of part of the AA, follow suggestions in
		permanent water body adjacent to the AA spills into the AA. If it enters only via a pipe, that pipe must be fed by a mapped stream or lake further upslope. If no, SKIP to F47 (pH Measurement).	0	F42 above. [NRv, PH, PRv, SRv]
F45	Input Water Temperature	Based on lack of shade, water source characteristics, or actual temperature measurements, the inflow is likely to be warmer than surface water in the AA during part of most years. Enter 1= yes, 0= no.	0	[WCv]
F46	Throughflow Resistance	During its travel through the AA at the time of peak annual flow, water arriving in channels: [select only the ONE encountered by most of the incoming water].		[FA, FR, INV, NR, OE, PR, SR, WS]
		Does not bump into many plant stems as it travels through the AA. Nearly all the water continues to travel in unvegetated (often incised) channels that have minimal contact with wetland vegetation, or through a zone of open water such as an instream pond or lake.	0	
		Bumps into herbaceous vegetation but mostly remains in fairly straight channels.	0	
		Bumps into herbaceous vegetation and mostly spreads throughout, or is in widely meandering, multi-branched, or braided channels.	0	
		Bumps into tree trunks and/or shrub stems but mostly remains in fairly straight channels. Bumps into tree trunks and/or shrub stems and follows a fairly indirect path from entrance to exit (meandering, multi-branched, or braided).	0	
F47	pH Measurement	The pH in most of the AA's surface water:		Preferably, measure this in larger areas of ponded surface water within the AA, or in streams that have
		Was measured, and is: [enter the reading in the column to the right.]		passed through (not along) most of the AA. Unless surface water is completely absent, do not dig holes or make depressions in peat in order to provide water for this measurement. Avoid measuring near
		Was not measured but surface water is present and is darkly tea-coloured. Or if no surface water, then mosses and plants that indicate peatland (e.g., Labrador teal) are prevalent. Enter *1*. Neither of above. Enter *1*.	0	roads or in puddles formed only by recent rain. [AM, FA, FR, NR, WBF, PH, PR, Sens, WBF, WBN]
F48	TDS and/or Conductivity	The TDS (total dissolved solids) or conductivity off the AA's surface water is: (select the first true row with information):		See above for measurement guidance. [FR, INV, NRv, PH, PRv, Sens]
	Condition	TDS is: [Enter the reading in ppm or mg/L in the column to the right, if measured, or answer next row.] Conductivity is [Enter the reading in µSicm in the column to the right.]		
		Was not measured, but plants that indicate saline conditions cover much of the vegetated AA. Enter "1".	0	
F49	Beaver Probability	Neither of above Use of the AA by beaver during the past 5 years is (select most applicable ONE):	1	[FA, FR, PH, SBM, Sens, WBF, WBN]
		Evident from direct observation or presence of gnawed limbs, dams, tracks, dens, lodges, or extensive stands of water-killed trees (snags).	0	
		Likely based on known occurrence in the region and proximity to suitable habitat, which may include: (a) a persistent freshwater wetland, pond, or lake, or a perennial low or mid-gradient (<10%) channel, and (b) a corridor or multiple stands of hardwood trees and shrubs in	0	
		vegetated areas near surface water. Unlikely because site characteristics above are deficient, and/or this is a settled area or other area where beaver are routinely removed.	1	
F50	Groundwater Strength of Evidence	Select first applicable choice:		Adhere to these criteria strictly do not use personal judgment based on fen conditions, pH, or other evidence. Consult topographic maps to detect breaks in slope described here. Rust deposits
	of Evidence	Springs are known to be present within the AA, or if groundwater levels have been monitored, that has demonstrated that groundwater primarily discharges to the wetland for longer periods during the year than periods when the wetland recharges the groundwater.	0	associated with groundwater seeps may be most noticeable as orange discoloration in ice formations along streams during early winter. [AM, CS, FA, FR, INV, NR, OE, PH, PRV, SFS, WC, WS]
		Most of the AA has a slope of >5%, or is very close to the base of a natural slope longer than 100 and much steeper than the slope of the AA, AND the pH of surface water, if known, is >5.5. Neither of above is true, although some groundwater may discharge to or flow through the AA. Or groundwater influx is unknown.	0	
F51	Internal Gradient	The gradient along most of the flow path within the AA is:		This is not the same as the shoreline slope. It is the elevational difference between the AA's inlet and
		<2% or the AA has no surface water outlet (not even seasonally).	1	outlet, divided by the flow-distance between them and converted to percent. If available, use a clinometer to measure this. Free clinometer apps can be downloaded to smartphones. If the wetland is
		2-5%. 6-10%.	0	large (longer than -1 km), this may be estimated using Google Earth to determine the minimum and maximum elevation within the AA, then dividing by length and multiplying by 100. [CS, NR, OE, PR,
NI-C C	and the second of	>10%.	0	SR, WBF, WBN, WS]

	Potential	For an average person, walking is physically possible <u>in</u> (not just near) >5% of the AA during most of the growing season, e.g., free of deep water and dense shrub thickets.	1	
		Maintained roads, parking areas, or foot-trails are within 10 m of the AA, or the AA can be accessed part of the year by boats arriving via contiguous waters.	0	
		Within or near the AA, there is an interpretive center, trails with interpretive signs or brochures, and/or regular guided interpretive tours.	0	
60	Unvisited Core Area	The percentage of the AA almost never visited by humans during an average growing season probably comprises: [Nole: Only include the part actually walked or driven (not simply viewed from) with a vehicle or boat. Do not include visitors on trails outside of the AA unless more		[AM, FAv, FRv, PH, PU, SBM, STR, WBF, WBN]
		than half the wetland is visible from the trails and they are within 30 m of the wetland edge. In that case include only the area occupied by the trail.]		
		<5% and no inhabited building is within 100 m of the AA.	0	
		<5% and inhabited building is within 100 m of the AA.	0	
		5-50% and no inhabited building is within 100 m of the AA.	0	
		5-50% and inhabited building is within 100 m of the AA.	0	1
		50-95%, with or without inhabited building nearby.	1	
		>95% of the AA with or without inhabited building nearby.	0	
61	Frequently Visited Area	The part of the AA visited by humans almost daily for several weeks during an average growing season probably comprises: [See note above.]		[AM, PH, PU, SBM, STR, WBF, WBN]
		<5%. If F60 was answered ">95%" (mostly never visited), SKIP to F64.	1	
		5-50%.	0	
		50-95%.	0	
		>95% of the AA.	0	
62	BMP - Soils	Boardwalks, paved trails, fences or other infrastructure and/or well-enforced regulations appear to effectively prevent visitors from walking on soil within nearly all of the AA when the soil is unfrozen. Enter "1" if true.	0	[PH, PU]
63	BMP - Wildlife Protection	Fences, observation blinds, platforms, paved trails, exclusion periods, and/or well-enforced prohibitions on motorised boats, off-leash pets, and off road vehicles appear to effectively exclude or divert visitors and their pets from the AA at critical times in order to minimize disturbance of wildlife (except during hunting seasons). Enter *1* if true.	0	[AM, PU, WBF, WBN]
64	Consumptive Uses	Recent evidence was found within the AA of the following potentially-sustainable consumptive uses. Select ALL that apply.		[FAv, FRv, WBFv]
	(Provisioning Services)	Low-impact commercial timber harvest (e.g., selective thinning).	0	
		Commercial or traditional-use harvesting of native plants, their fruits, or mushrooms.	0	1
		Waterfowl hunting.	0	
		Fishing.	0	
		Trapping of furbearers.	0	
		None of the above.	1	
65	Domestic Wells	The closest wells or water bodies that currently provide drinking water are:		[NRv]
		Within 0-100 m. of the AA.	0]
		100-500 m. away.	0	
		>500 m. away, or no information. The AA is, or is part of, a calcareous fen. See the Plants_Calcar worksheet in the accompanying Supplnfo file for list of plant indicators	1	(9), 69)
66	Calcareous Fen		0	[PH, PR]

essor (S) Data Form for Non-Tidal	Wetlands WESP-AC for New B	runswick Version 2	
Aberrant Timing of Water Inputs	Wetterland. Weer Ad for New B	Turiowick: Voloion 2.	
•	the standard of the standard o		
In the last column, place a check mark next to any item that is likely to more temporal homogeneity of flow or water levels) or more flashy (la			nuted (smaller or less frequent peaks spread over longer time:
Stormwater from impervious surfaces that drains directly to the wetla	and.		
Water subsidies from wastewater effluent, septic system leakage, sn	now storage areas, or irrigation.		
Regular removal of surface or groundwater for irrigation or other con-	sumptive use.		
Flow regulation in tributaries or water level regulation in adjoining wa	ter body, or other control structure at water entry points that regu	ulates inflow to the wetland.	
A dam, dike, levee, weir, berm, or fill within or downgradient from the	he wetland that interferes with surface or subsurface flow in/ou	ut of the AA (e.g., road fill, wellpads, pipelines).	
Excavation within the wetland, e.g., dugout, artificial pond, dead-end	ditch.		
Artificial drains or ditches in or near the wetland.			
Accelerated downcutting or channelization of an adjacent or internal	channel (incised below the historical water table level).		
Logging within the wetland.			
Subsidence or compaction of the wetland's substrate as a result of m	nachinery, livestock, fire, drainage, or off road vehicles.		
Straightening, ditching, dredging, and/or lining of tributary channels.			
If any items were checked above, then for each row of the table below To estimate effects, contrast the current condition with the condition if		no measurable effect on the timing of water conditions in any part of	the AA, then leave the "U's" for the scores in the following rov
	Severe (3 points)	Medium (2 points)	Mild (1 point)
Spatial extent of timing shift within the wetland:	>95% of wetland.	5-95% of wetland.	<5% of wetland.
When most of the timing shift began:	<3 yrs ago.	3-9 yrs ago.	10-100 yrs ago.
Score the following 2 rows only if the altered inputs began within past	10 years, and only for the part of the wetland that experiences the	, ,	
Input timing now vs. previously:	Shift of weeks.	Shift of days.	Shift of hours or minutes.
Flashiness or muting:	Became very flashy or controlled.	Intermediate.	Became mildly flashy or controlled.

Assessment Area (AA) Results:

Wetland ID: BB-Trib5-W-02

Date: 17 September 2019

Observer: Matt Alexander

Latitude & Longitude (decimal degrees): 45.174268, 66.206582

Scores will appear below after data are entered in worksheets OF, F, and S. See Manual for definitions and descriptions of how scores were computed.

computed.						
Wetland Functions or Other Attributes:	Function Score (Normalised)	Function Rating	Benefits Score (Normalised)	Benefits Rating	Function Score (raw)	Benefits Score (raw)
Water Storage & Delay (WS)	4.13	Moderate	1.58	Lower	4.90	1.65
Stream Flow Support (SFS)	2.66	Lower	2.97	Moderate	1.42	1.73
Water Cooling (WC)	0.00	Lower	0.00	Lower	0.00	0.00
Sediment Retention & Stabilisation (SR)	5.94	Higher	2.06	Lower	7.22	1.25
Phosphorus Retention (PR)	4.51	Higher	4.55	Moderate	6.10	4.44
Nitrate Removal & Retention (NR)	1.74	Lower	5.50	Moderate	4.90	6.00
Carbon Sequestration (CS)	6.49	Higher			7.36	
Organic Nutrient Export (OE)	3.70	Moderate			4.30	
Anadromous Fish Habitat (FA)	0.00	Lower	0.00	Lower	0.00	0.00
Resident Fish Habitat (FR)	0.00	Lower	0.00	Lower	0.00	0.00
Aquatic Invertebrate Habitat (INV)	4.90	Moderate	0.60	Lower	5.60	1.57
Amphibian & Turtle Habitat (AM)	2.17	Lower	4.78	Moderate	4.44	4.99
Waterbird Feeding Habitat (WBF)	0.00	Lower	0.00	Lower	0.00	0.00
Waterbird Nesting Habitat (WBN)	0.00	Lower	0.00	Lower	0.00	0.00
Songbird, Raptor, & Mammal Habitat (SBM)	6.00	Moderate	10.00	Higher	4.97	10.00
Pollinator Habitat (POL)	8.84	Higher	10.00	Higher	7.12	10.00
Native Plant Habitat (PH)	4.72	Moderate	8.49	Higher	4.99	7.36
Public Use & Recognition (PU)			2.19	Lower		1.89
Wetland Sensitivity (Sens)			1.53	Lower		2.66
Wetland Ecological Condition (EC)			3.49	Moderate		6.25
Wetland Stressors (STR) (higher score means more stress)			7.58	Higher		5.05
Summary Ratings for Grouped Functions:						
HYDROLOGIC Group (WS)	2.66	Moderate	1.58	Lower	4.90	1.65
WATER QUALITY SUPPORT Group (max+avg/2 of SR, PR, NR, CS)	5.00	Moderate	4.77	Moderate	6.88	4.95
AQUATIC SUPPORT Group (max+avg/2 of SFS, INV, OE, WC)	3.85	Moderate	2.08	Moderate	4.21	1.42
AQUATIC HABITAT Group (max+avg/2 of FA, FR, AM, WBF, WBN)	1.30	Lower	2.87	Lower	2.67	2.99
TRANSITION HABITAT Group (max+avg/2 of SBM, PH, POL)	7.68	Higher	9.75	Higher	6.41	9.56
WETLAND CONDITION (EC)			3.49	Moderate		6.25
WETLAND RISK (average of Sensitivity & Stressors)			4.56	Higher		3.85
	DIOTE A				1 16 1	

NOTE: A score of 0 does not mean the function or benefit is absent from the wetland. It means only that this wetland has a capacity that is equal or less than the lowest-scoring one, for that function or benefit, from among the 98 NB calibration wetlands that were assessed previously.

Cover Page: Basic Description of Assessment	WESP-AC version 2
09.41	
	Burchill Wind Energy Project - BB-Trib7-W-01
Investigator Name:	Matt Alexander
Date of Field Assessment:	12 September 2019
Nearest Town:	Lorneville (west Saint John), New Brunswick
Latitude (decimal degrees):	45.182871
Longitude (decimal degrees):	66.207452
Is a map based on a formal on-site wetland delineation available?	
Approximate size of the Assessment Area (AA, in hectares):	0.31
AA as percent of entire wetland (approx.). Attach sketch map if AA is smaller than the entire contiguous wetland.	
What percent (approx.) of the wetland were you able to visit?	100
What percent (approx.) of the AA were you able to visit?	
Were you able to ask the site owner/manager about any of the questions?	
Indicate here if you intentionally surveyed for rare plants, calciphile plants, or rare animals:	
Have you attended a WESP-AC training session? If so, indicate approximate month & year.	Yes, September 2016
How many wetlands have you assessed previously using WESP-AC? (approx.)	15
	Catches runoff from pit/quarry. Flow to the wetland is flashy as observed during a precipitation event.

vestigator: Matt Alexander

Form OF (Office). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Conduct an assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answering many of the questions below will equire using these online map viewers:

Google Earth Pro: https://www.google.com/earth/download/gep/agree.html

GeoNB: http://www.snb.ca/geonb1/ and http://www.snb.ca/geonb1/e/apps/apps-E.asp

Geons: http://www.snb.ca/geonol/ and http://www.snb.ca/geonol/e/apps/apps/apps-e.asp
For most wetlands, completing this office data form will require 1-2 hours. For a list of functions to which each question pertains, see bracketed abbreviations in the Definitions/Explanations column. For detailed descriptions of each
WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus
Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding
Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity, STR= Stressors.

#	Indicators	Condition Choices	Data	Definitions/Explanations
DF1	Province	Mark the province in which the AA is located by changing the 0 in the column next to it to a "1". Mark only one.		This determines to which province's calibration wetlands the raw score of any wetland is normalised. In the function and benefits models, it also triggers the automatic exclusion of indicators for which no
		New Brunswick	1	spatial data exists in a particular province.
		Nova Scotia	0	
		Prince Edward Island	0	
		Newfoundland-Labrador	0	
DF2	Ponded Area Within 1 km.	The area of surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) within 1 km is:		"Adjacent" means not separated from the AA by a wide expanse (>50 m) of upland (including roads >50 m wide). Include ponded areas likely to be hidden by wetland vegetation. If surface water
		<0.01 hectare (about 10 m x 10 m).	1	extends beyond 1 km, include only the part within 1 km. Do not include tidal areas. Measure the ar from aerial imagery using Google Earth Pro (click on Ruler icon in toolbar, then Polygon in pop-up
		0.01 - 0.1 hectare.	0	menu). With the GeoNB viewer, enable the Wetlands layer, then measure with the Draw & Measure
		0.1 - 1 hectare.	0	tool after specifying Aerial as the Basemap. However, do not rely entirely on wetland boundaries
		1 to 10 hectares.	0	shown in online wetlands layers. [PH, SBM, WBN]
		10 to 100 hectares.	0	4
)F3	Ponded Water &	>100 hectares. The area of wetlands and surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) within		See definition of adjacent in OF2. If the AA's wetland vegetation extends beyond 1 km, include only
,, ,	Wetland Within 1 km.	1 km is:		the part within 1 km. "Ponded" means not flowing in rivers or streams. [Sens, WBF]
		<0.01 hectare (about 10 m x 10 m).	0	
		0.01 - 0.1 hectare. 0.1 - 1 hectare.	0	1
		1 to 10 hectares.	0	1
		10 to 100 hectares.	1	
		>100 hoctares.	0	1
)F4	Size of Largest Nearby	The largest vegetated patch or corridor that includes the AA's vegetation plus aladjacent upland vegetation that is not lawn, row crops,	T	See definition of adjacent in OF2. Use Google Earth Pro's polygon ruler (as described above).
	Vegetated Tract or Corridor	heavily grazed lands, conifer plantation is:	^	Exclude conifer plantations only if it is obvious that trees were planted in rows. [AM, PH, SBM, Sens
		<0.01 hectare (about 10 m x 10 m).	0	4
		0.01 - 0.1 hectare. 0.1 - 1 hectare.	0	1
		to 10 hectares.	0	1
		10 to 100 hectares.	0	1
		100 to 1000 hectares.	0	1
		>1000 hectares. [This is nearly always the answer in relatively undeveloped landscapes]	1	
DF5	Distance to Large Vegetated Tract	The minimum distance from the edge of the AA to the edge of the closest vegetated land (but excluding row crops, lawn, conifer plantation) larger than 375 hectares (about 2 km on a side), is:		To measure distance, use Google Earth Pro (Ruler > Line tool). Or use Draw & Measure tool at GeoNB. The 375-ha criterion is from the Fundy Model Forest Project. [AM, PH, POL, SBM, Sens]
		<50 m, and not separated from the 375-ha vegetated area by any width obaved roads, stretches of open water, row crops, bare ground, lawn, or impervious surface. Or the AA itself contains >375 ha of vegetation. [This is often the answer in relatively undeveloped landscaped to the contains of the con	1	
		<50 m, but completely separated from the 375-ha vegetated area by those features, and AA does not contain >375 ha of vegetation.	0	
		50-500 m, and not separated.	0	
		50-500 m, but separated by those features.	0	1
		0.5 - 5 km, and not separated.	0	
		0.5 - 5 km, but separated by those features.	0	
		None of the above (the closest patches or corridors which are that large are >5 km away).	0	
OF6	Herbaceous Uniqueness	The AA's vegetation cover is >10% herbaceous* but uplands within 5 km have <10% herbaceous cover. If so, enter "3" and continue to OF7. If not, consider: The AA's vegetation cover is >10% herbaceous* but uplands within 1 km have <10% herbaceous cover. If so enter "2" and continue to OF7. If not, consider: The AA's vegetation cover is >10% herbaceous* but uplands within 100 m of the wetland edge have <10% herbaceous cover. If so, enter "1". "I'. "NOTE: Exclude lawns, row crops, heavily grazed lands, forest, shrublands. Include moss as well as grasslike plants in this use of "herbaceous vegetation"].	0	For this question only, consider moss to be herbaceous vegetation. Determine the score by Meximideral imagery in Google Earth affer successively drawing or estimating the boundaries of the buffer of 5 km, 1 km, and 100 m radius focused on the center of the AA. Circles of specified radius can be drawn in Google Earth Pro by clicking on the Ruler icon, then Circle in the pop-up menu. [AMV, PHPOLV, SBMV, WBFV, WBNV]
)F7	Woody Uniqueness	The AA's vegetation cover is >10% woody" but uplands within 5 km have <10% woody cover. If so, enter "3" and continue to OF8. If not, consider: The AA's vegetation is >10% woody" but uplands within 1 km have <10% woody cover. If so enter "2" and continue to OF8. If not, consider: The AA's vegetation is >10% woody" but uplands within 100 m of the wetland edge have <10% woody cover. If so, enter "1" ["NOTE: woody cover = trees & shrubs taller than 1 m.]	0	See above. Do not consider conlifer plantations to be forest if it is obvious that trees were planted in rows. [AMV, PHV, POLV, SBMV]
)F8	Local Vegetated Cover Percentage	Draw a 5-km radius circle measured from the center of the AA. Ignoring all permanent water in the circle, the percent of the remaining an that is wooded or unmanaged herbaceous vegetation (NOT lawn, row crops, bare or heavily grazed land, clearcuts, or confer plantations is:		In Google Earth, draw the 5 km buffer and then estimate land cover percentages, or do GIS analysis of an appropriate land cover layer. [AM, PH, POL, SBM, Sens]
		<5% of the land.	0	1
		5 to 20% of the land.	0	
		20 to 60% of the land.	0]
		60 to 90% of the land.	0	
		>90% of the land. SKIP to OF10.	1	
DF9	Type of Land Cover	Within the 5-km radius circle, and ignoring all permanent water, the land area that is bare or non-perennial cover is mostly:		[AM, SBM]
	Alteration	Impervious surface, e.g., paved road, parking lot, building, exposed rock.	0	
		Bare pervious surface, e.g., lawn, recent (<5 yrs ago) clearcut, dirt or gravel road, cropland, landslide, conifer plantation.	0	
				"Population center" means a settled area with more than about 5 regularly- inhabited structures per
	Distance by Road to	Measured along the maintained road nearest the AA, the distance to the nearestpopulation center is:		
	Nearest Population		0	square kilometer. In Google Earth, click on the Ruler icon, then Path, and draw and measure the
		Measured along the maintained road nearest the AA, the distance to the nearestpopulation center is: <100 m. 100 - 500 m.	0	square kilometer. In Google Earth, click on the Ruler icon, then Path, and draw and measure the route. Or use the GeoNB's Draw & Measure tool> Freehand Line to draw and measure the route to
	Nearest Population	<100 m.		square kilometer. In Google Earth, click on the Ruler icon, then Path, and draw and measure the
	Nearest Population	<100 m. 100 - 500 m.	0	square kilometer. In Google Earth, click on the Ruler icon, then Path, and draw and measure the route. Or use the GeoNB's Draw & Measure tool> Freehand Line to draw and measure the route to Settlements (click on Place Names in menu) or other areas not close to mapped settlements but

OF11	Distance to Nearest	From the center of the AA, the distance to the nearest maintained public road (dirt or paved) is:		Determine this by viewing aerial imagery in Google Earth and measuring with the Ruler>Line tool. C
	Maintained Road	<10 m.	0	use the GeoNB's Draw Line tool. [AM, FAv, FRv, NRv, PH, PU, SBM, STR, WBN]
		10 - 25 m.	- 1	
		25 - 50 m.	0	
		50 - 100 m. 100 - 500 m.	0	-
		>500 m.	0	-
OF12	Wildlife Access	Draw a circle of radius of 5 km from the center of the AA. If mammals and amphibians can move from the center of the AA to ALL other separate wetlands and ponds located within the circle without being forced to cross pavement (any width), lawns, bare ground, and/or marine waters, mark 1= yes can move to all, 0= no. Change toblank if there are no other wetlands within 5 km.	0	In NB, enable the Wetlands layer in GeoNB (despite its omissions) to show surrounding wetlands ar roads, while estimating the location of the 5 km circle (or draw the 5 km circle in Google Earth Pro using the Circle tool and compare). Evaluate using Google Earth, being cautious to search for roads hidden under forest canopy. [AM, SBM, STR]
OF13	Distance to Ponded	The distance from the AA center to the closest (but separate) ponded water body visible in GoogleEarth imagery is:		In Google Earth, zoom in closely to examine the surrounding landscape for ponds, lakes, and
01.10	Water	<50 m, and not separated by any width of paved roads, stretches of open water, row crops, lawn, bare ground, or impervious surface.	0	wetlands that appear to be permanently flooded. Enable the GeoNB viewer's Wetlands layer as wet [AM, PH, SBM, Sens, WBF, WBN]
		<50 m, but completely separated by those features.	0	
		50-500 m, and not separated.	0	
		50-500 m, but separated by those features. 0.5 - 1 km. and not separated.	0	1
		0.5 - 1 km, but separated by those features.	0	1
		None of the above (the closest patches or corridors that large are >1 km away).	0	
OF14	Distance to Large Ponded Water	The distance from the AA center to the closest (but separate)non-tidal body of water that is ponded during most of the year and islarger than 8 hectares during most of a normal year is: -100 m.	0	Determine this by viewing aerial imagery in Google Earth. [Sens, WBF, WBN]
		100 m - 1 km.	0	1
		1 -2 km.	1	
		2-5 km.	0	
		5-10 km.	0	-
OF15	Tidal Proximity	>10 km. The distance from the AA edge to the closestidal water body (regardless of its salinity) is:	0	In Google Earth, measure the distance to the ocean (including Bay of Fundy) or tidal river, whicheve
		** Color m.	0	is closer. If you need to see how far upriver a river is tidal, see the KMZ file provided with this
		100 m - 1 km.	0	calculator for NB (NB Headtide). Points shown in those files are only an approximation, so local information if available may be preferable. [FA, WBF]
		1 - 5 km.	1	
		5-10 km.	0	
		10-40 km.	0	
OF16	Upland Edge Contact	>40 km. Select one:	0	[NR, SBM, Sens]
01.10	opiala Eago ooniaa	The AA has no upland edge (or upland is <1% of perimeter). The AA is entirely surrounded by (& contiguous with) other wetlands or water	. 0	, (San, San)
		1-25% of the AA's perimeter abuts upland (including filled areas). The rest adjoins other wetlands or water that is mostly wider than the AA	0	
		25-50% of the AA's perimeter abuts upland. The rest adjoins other wetlands or water that is mostly wider than the AA.	0	
		50-75% of the AA's perimeter abuts upland. The rest adjoins other wetlands or water that is mostly wider than the AA.	0	
		More than 75% of the AA's perimeter abuts upland. Any remainder adjoins other wetlands or water that is mostly wider than the AA.This will be true for most assessments done with WESP-AC.	1	
OF17		Within 5 km downstream or downslope of the AA (select first true choice):		In the GeoNB map viewer: click on "More" in upper right, then "Flood Information". Expand the men
	tidal Waters	Maps show Flood Zone or Flood Risk areas and there appears to be infrastructure vulnerable to river flooding not caused by tidal storm surges.	0	under it by clicking on the arrow to its left and the slider to its right. Uncheck the first (Limits of Data) box. Where available, LIDAR imagery can provide finer elevational resolution useful for flood modeling, [WSV]
		Maps show Flood Zone or Flood Risk areas, but infrastructure is absent or is not vulnerable to floods from a non-lidal river. In some cases tevees, upriver dams, or other meastures may partly limit damage or risk from smaller events. Maps do not show Flood Zone or Flood Risk areas for no such mapping has been done locally) and there appears to be infrastructure	0	
		wags ou not show Flood zone or Flood Risk areas prino such mapping has been done rocally) and there appears to be initiastructure vulnerable to the flooding unrelated to tidal storm surges. Maps do not show Flood Zone or Flood Risk areas (or no such mapping has been done locally) and there ino infrastructure vulnerable	1	
OF18	Relative Elevation in Watershed	to river flooding unrelated to tidal storm surges. In Google Earth, enable the Terrain layer (lower left menu) and open the NB_Watersheds KMZ file that accompanies this calculator. Then determine the AXS approximate elevation (bottom right, NOT the "eye alt"). Then move cursor around to determine the watershed's	0.10	[FA, NR, Sens, SFSv, WCv, WSv]
OF19	Water Quality Sensitive	maximum and minimum elevation. Divide the AA's elevation by the (max-min). In Google Earth, open the KMZ file NB_Watershed Protected Area which accompanies this calculator. The AA is within such an area.	0.18	If an ACCDC report is available for this AA, it also may contain such information. [NRv]
OF20	Watershed or Area Degraded Water	Enter 1= yes, 0- no. Sampling indicates a problem with concentrations of metals, hydrocarbons, nutrients, or other substances (excluding bacteria, acidic		May use existing data, or sample those waters as part of this wetland assessment. "Harmful" should
	Upstream	water, high temperatures) being present at levels harmful to aquatic life or humans, and: The condition is present within the AA.	0	be evaluated with regard to current federal or provincial water quality standards. [AM, FA, FR, NRv, PRv, SRv, STR, WBF, WBN]
		The condition is present within the AA. The condition is present in waters within 1 km that flowinto the AA, but has not been documented in the AA itself.	0	1
		Sampling during both low water periods and times with high runoff (storms, snowmelt) indicates no problems in either the AA or inflowing waters.	0	
		Data are insufficient (no or inadequate sampling within 1 km, or condition exists only at >1 km upstream)This is the situation for nearly all wetlands in this region.	1	
OF21	Degraded Water	The problem described above is downslope from the AA, and:		May use existing data, or monitor waters as part of this wetland assessment. [NRv, PRv, SRv]
	Downstream	The condition is present within 1 km downslope and connected to the AA by a channel.	0	1
		The condition is present within 5 km downslope and connected to the AA by a channel, or within 1 km but not connected to the AA by a channel. Consoling duties both to under a printed and times with high purel' (degree, populated to a probleme in all the AA or influsion.)	0	
		Sampling during both low water periods and times with high runoff (storms, snowmelt) indicates no problems in either the AA or inflowing waters. Data are insufficient (no or inadequate sampling within 1 km, or condition exists only at >1 km upstream)This is the situation for nearly	0	
050-	Markey or an	all wetlands in this region.		Township was a substitute of the substitute of t
OF22	Wetland as a % of Its Contributing Area (Catchment)	From a topographic map and field observations, estimate the approximate boundaries of the catchment (CA) of the entire wetland of which AM may be only a part. Then adjust those boundaries if necessary based on your field observations of the surrounding, and/or t using procedures described in the Manual. Divide the area of the wetland (not just the AA) by the approximate area of its catchment excluding the area of the wetland itself. When doing the calculation, if ponded water is adjacent to the wetland, include that in the wetland area. The result is:	V	Topographic maps may be viewed online at the National Atlas of Canada (Toporama): http://atlas.gc.ca/loporama/en/index.html [NR, PR, Sens, SR, WS]
		< 0.01, or catchment size unknown due to stormwater pipes that collect water from an indeterminate area. 0.01 to 0.1.	0	-
		0.1 to 1.	1	1

Form F (Field). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Walk for no less than 10 minutes from the wetland edge towards its core, in the part of the AA that is proposed for alteration. If no alteration is proposed, walk in a portion that appears to be most representative of the wetland overall. Walk only where it is safe and legal to do so. Conduct the assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answer these questions primarily based on your onsite observations and interpretations. Do not write in shaded parts of this data form. Answering some questions accurately may require conferring with the landowner or other knowledgable persons and/or reviewing aerial imagery. For most wetlands, completing this field data form will require 1-2 hours on a site. For a list of functions to which each question pertains, see the accompanying Interpretations form. For detailed descriptions of each WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage & Delay, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity, STR= Stressors.

#	Indicators	Condition Choices	Data	Definitions/Explanations
1	Wetland Type	Follow the key below and mark the ONE row that best describes MOST of the vegetated part of the AA:		Ericaceous shrubs are ones in the heather family (Ericaceae). Most have leathery evergreen leaves. They include rhododendron, azalea, swamp laurel, leatherleaf, Labrador tea, and others. Most require
		A. Moss and/or lichen cover more than 25% of the ground. Often dominated by ericaceous shrubs (e.g., Labrador tea) or other acid-tolerant plants (e.g., bog cranberry, pitcher plant, sundew, orchids). Substrate is mostly undecomposed peat. Choose between A1 and A2 and mark the choice with a 1 in their adjoining column. Otherwise go to B below.		acidic soil. Although not in the family Ericaceae, sweetgale (Myrica gale) should be counted also. [AM, CS, FA, FR, INV, NR, OE, PH, Sens, SFS, WBF, WBN]
		A1. Surface water is usually absent or, if present, pH is typically <4.5 and conductivity is usually <100 µS/cm (<64 ppm TDS). Trees are absent or nearty so. Sedge cover usually sparse or absent but cottongrass and/or lichen cover may be extensive, as well as cloudberry, lingonberry, sheep laurel, and a sedge (Carex rarillora). Welland surface and surrounding landscape are seldom sloping and wetland often is domed (convex). Inlet and outlet channels are usually absent. If known, pH of peat is <4.0.	0	
		A2. Not A1. Surface water, if present, has pH typically >4.5 and conductivity is usually >100 µS/cm (>64 ppm TDS). Sedge cover is usually extensive, and/or tree and fall shrub cover is extensive. Sometimes at toe of slope or edge of water body. An exit channel is usually present. Wetter than A1 and peat depth may be shallower (<2 m).	0	
		B. Moss and/or lichen cover less than 25% of the ground. Soil is mineral or decomposed organic (muck). Choose between B1 and B2 and mark the choice with a 1 in their adjoining column:		
		B1. Trees and shrubs taller than 1 m comprise more than 25% of the vegetated cover. Surface water is mostly absent or inundates the vegetation only seasonally (e.g., vernal pools or floodplain).	1	
		B2. Not B1. Tree & tall shrubs comprise less than than 25% of the vegetated cover. Vegetation is mostly herbaceous, e.g., cattail, bulrush, burreed, pond lily, horsetail. Surface water may be extensive and fluctuates seasonally, being either persistent or drying up partly or entirely.	0	
AA sh nclud ' adja descn	ould also include part of a le the open water part adj cent " is used synonymo libed features along their a	he AA should include all persistent waters in ponds smaller than 8 hectares (-283 m on a side) that are adjacent to the AA. The the water area of adjacent ponded water larger than 8 ha and adjacent rivers wider than 20 m. Specifically, the AA should jacent to welland vegetation and equal in width to the average width of that vegetated zone. Throughout this form, usly with abutting, adjoining, bordering, contiguous and means no upland (manmade or natural) completely separates the directly shared edge. Features joined only by a channel are not necessarily considered to be adjacent a large portion of their res do not have to be hydrologically connected in order to be considered adjacent.		
2	Wetland Types - Adjoining or Subordinate	If the AA is smaller than 1 ha, mark all other types that occupy more than 1% of the vegetated AA. If the AA is larger than 1 ha, mark all other types which are within or adjacent to the AA and occupy more than 1 ha, as visible from the AA or as interpreted from aerial imagery. Do not mark again the type marked in F1.		1 hectare is 10,000 sq. m or about 2.5 acres. It could have dimensions of 100 m by 100 m, 1000 m by 10 m, or similar. [AM, INV, SBM, WBF]
		A1. A2.	0	
		B1.	0	
3	Woody Height & Form Diversity	B2. Following EACH row below, indicate with a number code the percentage of the living vegetation in the AA which is occupied by that feature (6 if >95%, 5 if 75-95%, 4 if 50-75%, 3 if 25-50%, 2 if 5-25%, 1 if <5%, 0 if none). If the vegetated part of the AA is largely herbaceous (non-woody) vegetation, these percentages should not sum to 100%.	0	Deciduous shrubs in this region usually include buttonbush, Labrador tea, bayberry (Morella), huckleberry, cranberry, cloudberry, sweetgale, alder, willow, birch, ash, dogwood, and a few others. If you assigned a code of 3 or higher to any of the first four choices and the ground cover beneath the
		coniferous trees (may include tamarack) taller than 3 m.	2	trees/shrubs is <25% moss, then question F1 might be "B1". [CS, INV, NR, PH, POL, SBM, Sens]
		deciduous trees taller than 3 m. coniferous or ericaceous shrubs or trees 1-3 m tall not directly below the canopy of trees.	2	
		deciduous shrubs or trees 1-3 m tall not directly below the canopy of trees. coniferous or ericaceous shrubs <1 m tall not directly below the canopy of taller vegetation.	3	
		deciduous shrubs or trees <1 m tall (e.g., deciduous seedlings) not directly below the canopy of taller vegetation.	2	
<u>Vote</u> :	If none of top 4 rows in Dominance of Most	F3 was marked 2 or greater , SKIP to F9 (N fixers). Determine which two woody plant species comprise the greatest portion of the low (-3 m) woody cover . Then choose one:		[PH, POL, SBM, Sens]
4	Abundant Shrub	those species together comprise > 50% of such cover.	1	[FR, FUL, SDW, Sells]
	Species	those species together do not comprise > 50% of such cover.	0	
5	Woody Diameter Classes	Mark ALL the types that comprise >5% of the woody canopy cover in the AA or >5% of the wooded areas (if any) along its upland edge perimeter). The edge should include only the trees whose canopies extend into the AA. conferous, 1-9 cm diameter and >1 m tall.	1	Estimate the diameters at chest height. If small-diameter trees are overlopped (shaded) by larger ones, visualise a "subcanopy" at the average height of the smaller-dbh trees, to serve as a basis for t minimum 5% canopy requirement in this question. The trees and shrubs need not be welland species
		broad-leaved deciduous 1-9 cm diameter and >1 m tall.	1	[AM, CS, POL, SBM, Sens, WBN]
		coniferous, 10-19 cm diameter. broad-leaved deciduous 10-19 cm diameter.	0	
		coniferous, 20-40 cm diameter.	1	
		broad-leaved deciduous 20-40 cm diameter. coniferous, >40 cm diameter.	0	
		broad-leaved deciduous >40 cm diameter.	0	
6	Height Class Interspersion	Follow the key below and mark the ONE row that best describes MOST of the AA: A. Neither the vegetation taller than 1 m nor the vegetation shorter than that comprise >70% of the vegetated part of the AA. They each comprise 30-70%. Choose between A1 and A2 and mark the choice with a 1 in the adjoining column. Otherwise go to B below.		[AM, INV, NR, PH, SBM, Sens]
		A1. The two height classes are mostly scattered and intermixed throughout the AA.	1	
		A2. Not A1. The two height classes are mostly in separate zones or bands, or in proportionately large clumps. B. Eilher the vegetation shorter than 1 m comprises >70% of the vegetated part of the AA, or the vegetation taller than that does. One size class might even be totally absent. Choose between B1 and B2 and mark the choice with a 1 in the adjoining column:	0	
		B1. The less prevalent height class is mostly scattered and intermixed within the prevalent one. B2. Not B1. The less prevalent height class is mostly located apart from the prevalent one, in separate zones or clumps, or is completely	0	
7	Large Snags (Dead	absent. The number of large snags (diameter >20 cm) in the AA plus adjacent upland area within 10 m of the wetland edge is:		Snags are dead standing trees that often (not always) lack bark and foliage. Include only ones that at
	Standing Trees)	None, or fewer than 8/ hectare which exceed this diameter.	0	at least 2 m tall. [POL, SBM, WBN]
		Several (>8/hectare) and a pond, lake, or slow-flowing water wider than 10 m is within 1 km.	0	
8	Downed Wood	Several (>8/hectare) but above not true. The number of downed wood pieces longer than 2 m and with diameter >10 cm, and not persistently submerged, is:	1	Exclude temporary "burn piles." [AM, INV, POL, SBM]
		Few or none that meet these criteria.	0	

FieldF form - Non-tidal Page 1 of 5

FQ	N Fixers	The percentage of the AA's vegetated cover that contains nitrogen-fixing plants (e.g., alder, sweetgale, clover, lupine, alfalfa, other legumes)		Do not include N-fixing algae or lichens. [FA, FR, INV, NRv, OE, PH, SBM, Sens]
1 7	IN FIXEIS	is:		DO NOT INCIDIDE INFINITY BIGGE OF INCIDENS. [F.A., F.K., INVV, INVV, OL., F.H., SDIW, SENS]
		<1% or none.	0	
		1-25% of the vegetated cover, in the AA or along its water edge (whichever has more).	0	
		25-50% of the vegetated cover, in the AA or along its water edge (whichever has more). 50-75% of the vegetated cover, in the AA or along its water edge (whichever has more).	0	
		>75% of the vegetated cover, in the AA or along its water edge (whichever has more).	0	
F10	Sphagnum Moss	The cover of Sphagnum moss (or any moss that forms a dense cushion many centimeters thick), including the moss obscured by taller		Exclude moss growing on trees and rocks. [CS, PH]
	Extent	sedges and other plants rooted in it, is:		
		<5% of the vegetated part of the AA.	0	
		5-25% of the vegetated part of the AA. 25-50% of the vegetated part of the AA.	0	
		50-95% of the vegetated part of the AA.	0	
		>95% of the vegetated part of the AA.	0	
F11	% Bare Ground &	Consider the parts of the AA that lack surface water at the driest time of the growing season. Viewed from directly above the ground layer, the		Thatch is dead plant material (stems, leaves) resting on the ground surface. Bare ground that is
	Thatch	predominant condition in those areas at that time is:		present under a tree or shrub canopy should be counted. Boulders count as bare ground. Wetlands with mineral soils and that are heavily shaded or are dominated by annual plant species tend to have
		Little or no (<5%) bare ground is visible between erect stems or under canopy anywhere in the vegetated AA. Ground is extensively blanketed by dense thatch, moss, lichens, graminoids with great stem densities, or plants with ground-hugging foliage.	1	more extensive areas that are bare during the early growing season. [AM, EC, INV, NR, OE, POL, PR, SBM, Sens]
		Slightly bare ground (5-20% bare between plants) is visible in places, but those areas comprise less than 5% of the unflooded parts of the AA.	0	
		Much bare ground (20-50% bare between plants) is visible in places, and those areas comprise more than 5% of the unflooded parts of the AA.	0	
		Other conditions.	0	
		Not applicable. Surface water (either open or obscured by emergent plants) covers all of the AA all the time.	0	
F12	Ground Irregularity	Imagine the AA without any living vegetation. Excluding the portion of the AA that is always under water, the number of hummocks, small pits, raised mounds, animal burrows, ruts, guilles, natural levees, microdepressions, and other areas of peat or mineral soil that are raised or depressed >10 cm compared to most of the area within a few meters surrounding them is:		The depressions may be of human or natural origin. [AM, EC, INV, NR, PH, POL, PR, SBM, SR, WS]
			0	
		Few or none (minimal microtopography; <1% of the land has such features, or entire AA is always water-covered). Intermediate.	1	
		Several (extensive micro-topography).	0	
F13	Upland Inclusions	Within the AA, inclusions of upland are:		[AM, NR, SBM]
		Few or none.	1	
		Intermediate (1 - 10% of vegetated part of the AA).	0	
		Many (e.g., wetland-upland "mosaic", >10% of the vegetated AA).	0	
F14	Soil Texture	In parts of the AA that lack persistent water, the texture of soil in the uppermost layer is mostly: [To determine this, use a trowel to check in at least 3 widely spaced locations, and use the soil texture key (in Appendix A of the Manual).]		[CS, NR, OE, PH, PR, Sens, SFS, WS]
		Loamy: soils that may contain a little fine grit and do not make a "ribbon" longer than 2 cm when moistened, rolled, squeezed, and extended	0	
		between thumb and forefinger.	U	
		Fines: includes silt, clay, silt, soils that make a ribbon longer than 2 cm when moistened, rolled, squeezed, and extended between thumb and	1	
		forefinger.	0	
		Deep Peat, to 40 cm depth or greater. Shallow Peat or organic <40 cm deep.	0	
		Coarse: includes sand, loamy sand, gravel, cobble, soils that do not make a ribbon when moistened, rolled, squeezed, and extended	0	
		between thumb and forefinger.		
F15	Shorebird Feeding Habitats	During any 2 consecutive weeks of the growing season, the extent of mudflats, bare unshaded saturated areas not covered by thatch, and unshaded waters shallower than 6 cm is: [Include also any area that is adjacent to the AA.]		This addresses needs of many but not all migratory sandpipers, plovers, and related species. [WBF]
	Habitats	None, or <100 sq. m.	1	
		100-1000 sq. m.	0	
		1000 – 10,000 sq. m.	0	
		>10,000 sq. m.	0	
F16	Herbaceous % of Vegetated Wetland	In aerial ("ducks eye") view, the maximum annual cover of herbaceous vegetation (all non-woody plants except moss) is:		[AM, WBF, WBN]
	rogolatoa vvoltaria	<5% of the vegetated part of the AA or <0.01 hectare (whichever is less). Mark "1" here and SKIP to F20 (Invasive Plant Cover).	0	
		5-25% of the vegetated part of the AA. 25-50% of the vegetated part of the AA.	0	
		50-95% of the vegetated part of the AA.	0	
		>95% of the vegetated part of the AA.	0	
F17	Forb Cover	Within parts of the AA having herbaceous cover (excluding SAV), the areal cover of forbs reaches an annual maximum of:		Forbs are flowering plants. Do not include grasses, sedges, cattail, other graminoids, ferns, horsetails,
		<5% of the herbaceous part of the AA.	1	or others that lack showy flowers. [POL]
		5-25% of the herbaceous part of the AA.	0	
		25-50% of the herbaceous part of the AA.	0	
		50-95% of the herbaceous part of the AA. >95% of the herbaceous part of the AA.	0	
F18	Sedge Cover	Sedges (Carex spp.) and cottongrass (Eriophorum spp.) occupy:	Ü	[CS]
	J	<5% of the vegetated area, or none.	0	
		5-50% of the vegetated area.	1	
		50-95% of the vegetated area.	0	
		>95% of the vegetated area.	0	
F19	Dominance of Most	Determine which two herbaceous species comprise the greatest portion of the herbaceous cover (excluding mosses and floating-leaved aquatic plants). Then choose one of the following:		For this question, include ferns as well as graminoids and forbs. [EC, INV, PH, POL, Sens]
	Abundant Herbaceous Species	aquatic plants). Then choose one or the following: those species together comprise > 50% of the areal cover of herbaceous plants at any time during the year.	1	
		those species together do not comprise > 50% of the areal cover of herbaceous plants at any time during the year.	0	
F20	Invasive Plant Cover	How extensive is the cover of invasive plant species in the AA? For species, see Plants_invasive worksheet in the accompanying Supplnfo		[EC, PH, POL, Sens]
		file. invasive species appear to be absent in the AA, or are present only in trace amount (a few individuals).	0	
		invasive species appear to be absent in the AA, or are present only in trace amount (a rew individuals). invasive species are present in more than trace amounts, but comprise <5% of herbaceous cover (or woody cover, if the invasives are	1	
		woody).		
		invasive species comprise 5-20% of the herb cover (or woody cover, if the invasives are woody).	0	
		invasive species comprise 20-50% of the herb cover. (or woody cover, if the invasives are woody).	0	
F21	Invasive Cover Along	invasive species comprise >50% of the herb cover (or woody cover, if the invasives are woody). Along the wetland-upland boundary, the percent of the upland edge (within 3 m upslope from the wetland) that is occupied by invasive plant	U	If a plant cannot be identified to species (e.g., winter conditions) but its genus contains an exotic
. 21	Upland Edge	species is:		species, assume the unidentified plant to also be exotic. If vegetation is so senesced that exotic
		none of the upland edge (invasives apparently absent), or AA has no upland edge.	0	species cannot be identified, answer "none". [PH, STR]
		some (but <5%) of the upland edge.	1	
		5-50% of the upland edge. most (>50%) of the upland edge.	0	
F22	Fringe Wetland	During most of the year, open water within or adjacent to the vegetated part of the wetland is much wider than the maximum width of the	0	[WBF, WBN, WCv]
		vegetated zone within the wetland. Enter "1" if true, "0" if false.		
F23	Lacustrine Wetland	The vegetated part of the AA is within or adjacent to a body of non-tidal standing open water whose size exceeds 8 hectares during most of	0	[FR, PR, PU, WBF, WBN]
		a normal year.		

FieldF form - Non-tidal Page 2 of 5

F24	% of AA Without Surface Water	The percentage of the AA that never contains surface water during an average year (that is, except perhaps for a few hours after snowmell or rainstorms), but which is still a wetland, is:		1 hectare is 10,000 sq. m or about 2.5 acres. It could have dimensions of 100 m by 100 m, 1000 m by 10 m, or similar. [AM, FA, FR, INV, NR, PH, PR, SBM, Sens, SRv, WBF, WBN, WC]
		<1%. In other words, all or nearly all of the AA is covered by water permanently or at least seasonally.	0	
		1-25% of the AA, or <1% but >0.01 ha never contains surface water. 25-50% of the AA never contains surface water.	0	
		50-75% of the AA never contains surface water.	0	
		75-99% of the AA never contains surface water, or >99% AND there is at least one persistent water body larger than 1 ha in the AA.	0	
		99-100%. AND there is no persistent ponded water body larger than 1 ha within the AA. Enter *1* and SKIP to F42 (Channel Connection).	0	
F25	% of AA with Persistent Surface Water	Identify the parts of the AA that still contain surface water (flowing or ponded, open or hidden beneath vegetation) even during the driest times of a normal year, i.e., when the AA's surface water is at its lowest annual level. At that time, the percentage of the AA that still contains surface water is:		If you are unable to determine the condition at the driest time of year, ask the land owner or neighbors about it if possible. Indicators of persistence may include fish, some dragonflies, beaver, and muskrat. [AM, CS, FA, FR, INV, NR, POL, PR, SBM, WBF, WBN]
		None. The AA dries up completely (no water in channels either) or never has surface water during most years. SKIP to F27.	0	
		1-20% of the AA.	1	
		20-50% of the AA. 50-95% of the AA.	0	
		>95% of the AA. True for many fringe wetlands.	0	
F26	% of Summertime Water that Is Shaded	At mid-day during the warmest time of year, the area of surface water within the AA that is shaded by vegetation and other features that are within the AA at that time is:		[FA, WC]
	water that is shaded	<5% of the water is shaded, or no surface water is present then.	0	
		5-25% of the water is shaded.	1	
		25-50% of the water is shaded. 50-75% of the water is shaded.	0	
		>75% of the water is shaded.	0	
F27	% of AA that is	The percentage of the AA's area that is between the annual high water and the annual low water (surface water) is:		Flood marks (algal mats, adventitious roots, debris lines, ice scour, etc.) are often evident when not
	Flooded Only Seasonally	None, or <0.01 hectare and <1% of the AA. SKIP to F29.	0	fully inundated. Also, such areas often have a larger proportion of upland and annual (vs. perennial) plant species. In riverine systems, the extent of this zone can be estimated by multiplying by 2 the
	Seasonally	1-20% of the AA, or <1% but >0.01 ha.	0	bankful height and visualising where that would intercept the land along the river. [CS, FA, INV, NR,
		20-50% of the AA. 50-95% of the AA.	0	OE, PH, SR, WBF, WBN, WS]
		>95% of the AA.	0	
F28	Annual Water	The annual fluctuation in surface water level within most of the parts of the AA that contain surface water at least temporarily is:		Look for flood marks (see above). Because the annual range of water levels is difficult to estimate
	Fluctuation Range	<10 cm change (stable or nearly so).	0	without multiple visits, consider asking the land owner or neighbors about it. [AM, CS, INV, NR, OE, PH, PR, SR, WBN, WS]
		10 cm - 50 cm change.	0	
		0.5 - 1 m change. 1-2 m change.	0	
		>2 m change.	0	
Is the /		d water smaller than 0.01 hectare (about 10m x 10m, or 1m x 100 m)? If so, enter *1* in column D and SKIP TO F42	0	
F29	Predominant Depth	During most of the time when surface water is present during the growing season, its depth, averaged over the entire inundated part of the		If a boat is unavailable, estimate this by considering wetland size and local topography. Or if timing and
	Class	AA, is: <10 cm deep (but >0).	0	safety allow, depths may be measured by drilling through winter ice. This question is asking about the spatial median depth that occurs during most of that time, even if inundation is only seasonal or
		10 - 50 cm deep.	1	temporary. If inundation in most but not all of the wetland is brief, the answer will be based on the depth
		0.5 - 1 m deep.	0	of the most persistently inundated part of the wetland. Include surface water in channels and ditches as well as ponded areas. [CS, FA, FR, INV, OE, PH, PR, Sens, SFS, SR, WBF, WBN, WC]
		1 - 2 m deep. >2 m deep. True for many fringe wetlands.	0	
F30	Depth Classes -	When present, surface water in most of the AA usually consists of (select one):	0	Estimate these proportions by considering the gradient and microtopography of the site. [FR, INV,
	Evenness of	One depth class that comprises >90% of the AA's inundated area (use the classes in the question above).	0	WBF, WBN]
	Proportions	One depth class that comprises 50-90% of the AA's inundated area.	1	
F04		Neither of above. There are 3 or more depth classes and none occupy >50%.	0	
F31	% of Water That Is Ponded (not Flowing)	During most times when surface water is present, the percentage that is (1) ponded (stagnant, or flows so slowly that fine sediment is not held in suspension) AND (2) is likely to be deeper than 0.5 m in some places, is: -5% of the water, or it occupies -100 sg.m cumulatively. Nearly all the surface water is flowing. SKIP to F34.	1	Nearly all wellands with surface water have some ponded water. [AM, CS, INV, NR, OE, PR, Sens, SR, WBF, WBN, WC, WS]
		5-30% of the water.	0	
		30-70% of the water.	0	
		70-95% of the water.	0	
F32	Ponded Open Water - Minimum Size	>95% of the water. During most of the growing season, the largest patch of open water that is ponded and is in or bordering the AA is >0.01 hectare (about 10 m by 10 m) and mostly deeper than 0.5 m. If true enter "1" and continue, If false, enter "0" and SKIP to F41 (Floating Algae & Duckweed).	0	Open water is not obscured by vegetation in aerial ("duck's eye") view. It includes vegetation floating on the water surface or entirely submersed beneath it.
F33	% of Ponded Water			
	that is Open	In ducks-eye aerial view, the percentage of the ponded water that is open (lacking emergent vegetation during most of the growing season, and unhidden by a forest or shrub canopy) is:		[AM, CS, FA, FR, INV, NR, OE, PR, SR, WBF, WBN, WC]
	that is Open		0	[AM, CS, FA, FR, INV, NR, OE, PR, SR, WBF, WBN, WC]
	that is Open	and unhidden by a forest or shrub canopy) is: None, or <1% of the AA and largest pool occupies <0.01 hectares. FieldF form - Non-tidal Page 3 of 5

F37	Interspersion of	During most of the part of the growing season when water is present, the spatial pattern of emergent vegetation within the water is mostly:		[AM, FA, FR, INV, NR, OE, PH, PR, SBM, SR, WBF, WBN]
	Emergents & Open Water	Scattered. More than 30% of such vegetation forms small islands or corridors surrounded by water.	0	
	water	Intermediate.	1	
		Clumped. More than 70% of such vegetation is in bands along the wetland perimeter or is clumped at one or a few sides of the surface water area.	0	
F38	Persistent Deepwater	If the deepest patch of surface water (flowing or ponded) in or directly adjacent to the AA is mostly deeper than 0.5 m for >2 weeks during the	0	
F39	Area Non-vegetated Aquatic	growing season, enter "1" and continue. If not, enter "0" and SKIP to F42.(Connection). During most of the growing season and in waters deeper than 0.5 m, the cover for fish, aquatic invertebrates, and/or amphibians that is		For this question, consider only the wood that is at or above the water surface. Estimates of underwater
1 37	Cover	provided NOT by living vegetation, but by accumulations of dead wood and undercut banks is:		wood based only on observations from terrestrial viewpoints are unreliable so should not be attempted.
		Little or none. Intermediate.	0	[AM, FA, FR, INV]
		Extensive.	0	
F40	Isolated Island	The AA contains (or is part of) an island or beaver lodge within a lake, pond, or river, and is isolated from the shore by water depths > 1 m on all sides during an average June. The island may be solid, or it may be a floating vegetation mat that is sufficiently large and dense to support a waterbird nest.	0	[WBN]
F41	Floating Algae & Duckweed	At some time of the year, mats of algae and/or duckweed are likely to cover >50% of the AA's otherwise-unshaded water surface, or blanket >50% of the underwater substrate. If true, enter "1" in next column. If untrue or uncertain, enter "0".	0	[EC, PR, WBF]
F42	Channel Connection & Outflow Duration	The most persistent surface water connection (outlet channel or pipe, ditch, or overbank water exchange) between the AA and a downslope stream network is: [Note: If the AA represents only part of a welland, answer this according to whichever is the least permanent surface connection: the one between the AA and the rest of the welland, or the surface connection between the welland and the downslope stream network.] Persistent (surface water flows out for >9 months/year).	1	Consider the connection regardless of whether the surface water is frozen. The "downslope stream network" could consist of ditches, rivers, ponds, or lakes which eventually connect to the ocean. If this cannot be determined while visiting the AA, consult topographic maps perhaps by viewing these online with Toporama (http://atlas.mcan.gc.ca/toporama/en/index.html) [CS, FA, FR, NR, OE, PR, Sens, SFS SR, WCv, WS]
		Seasonal (surface water flows out for 14 days to 9 months/year, not necessarily consecutive).	0	
		Temporary (surface water flows out for <14 days, not necessarily consecutive). None but maps show a stream network downslope from the AA and within a distance that is less than the AA's length. SKIP to F47 (pH	0	
		Measurement).		
		No surface water flows out of the wetland except possibly during extreme events (<once (ph="" 10="" a="" an="" ditch,="" f47="" flows="" into="" lacks="" lake="" measurement).<="" only="" or="" or,="" outlet.="" per="" skip="" td="" that="" to="" water="" wetland,="" years).=""><td>0</td><td></td></once>	0	
F43	Outflow Confinement	During major runoff events, in the places where surface water exits the AA or connected waters nearby, the water:		"Major runoff events" would include biennial high water caused by storms and/or rapid snowmelt. [CS, NR, OE, PR, Sens, SR, STR, WS]
		Mostly passes through a pipe, culvert, narrowly breached dike, berm, beaver dam, or other partial obstruction (other than natural topography) that does not appear to drain the wetland artificially during most of the growing season.	1	,,,,,
		Leaves through natural exits (channels or diffuse outflow), not mainly through artificial or temporary features.	0	
		Is exported more quickly than usual due to ditches or pipes within the AA or connected to its outlet, or within 10 m of the AA's edge, which drain the wetland artificially, or water is pumped out of the AA.	0	
F44	Tributary Channel	At least once annually, surface water from a tributary channel that is >100 m long moves into the AA. Or, surface water from a larger permanent water body adjacent to the AA spills into the AA. If it enters only via a pipe, that pipe must be fed by a mapped stream or lake further upslope. If no, SKIP to F47 (pH Measurement).	0	If inlet tributaries cannot be searched for due to inaccessibility of part of the AA, follow suggestions in F42 above. [NRv, PH, PRv, SRv]
F45	Input Water Temperature	Based on lack of shade, water source characteristics, or actual temperature measurements, the inflow is likely to be warmer than surface water in the AA during part of most years. Enter 1= yes, 0= no.	0	[MCA]
F46	Throughflow	During its travel through the AA at the time of peak annual flow, water arriving in channels: [select only the ONE encountered by most of the incoming water].		[FA, FR, INV, NR, OE, PR, SR, WS]
	Resistance	Does not bump into many plant stems as it travels through the AA. Nearly all the water continues to travel in unvegetated (often incised)	0	
		channels that have minimal contact with wetland vegetation, or through a zone of open water such as an instream pond or lake.		
		Bumps into herbaceous vegetation but mostly remains in fairly straight channels.	0	
		Bumps into herbaceous vegetation and mostly spreads throughout, or is in widely meandering, multi-branched, or braided channels.	0	
		Bumps into tree trunks and/or shrub stems but mostly remains in fairly straight channels. Bumps into tree trunks and/or shrub stems and follows a fairly indirect path from entrance to exit (meandering, multi-branched, or braided).	0	
F47	pH Measurement	The pH in most of the AA's surface water:		Preferably, measure this in larger areas of ponded surface water within the AA, or in streams that have passed through (not along) most of the AA. Unless surface water is completely absent, do not dig holes
		Was measured, and is: [enter the reading in the column to the right.] Was not measured but surface water is present and is darkly tea-coloured. Or if no surface water, then mosses and plants that indicate	1	or make depressions in peat in order to provide water for this measurement. Avoid measuring near
		peatland (e.g., Labrador lea) are prevalent. Enter "1". Neither of above. Enter "1".	0	roads or in puddles formed only by recent rain. [AM, FA, FR, NR, WBF, PH, PR, Sens, WBF, WBN]
F48	TDS and/or	The TDS (total dissolved solids) or conductivity off the AA's surface water is: (select the first true row with information):	U	See above for measurement guidance. [FR, INV, NRv, PH, PRv, Sens]
	Conductivity	TDS is: [Enter the reading in ppm or mg/L in the column to the right, if measured, or answer next row.]		
		Conductivity is [Enter the reading in µS/cm in the column to the right.] Was not measured, but plants that indicate saline conditions cover much of the vegetated AA. Enter *1*.	0	
		Neither of above	1	
F49	Beaver Probability	Use of the AA by beaver during the past 5 years is (select most applicable ONE):		[FA, FR, PH, SBM, Sens, WBF, WBN]
		Evident from direct observation or presence of gnawed limbs, dams, tracks, dens, lodges, or extensive stands of water-killed trees (snags).	0	
		Likely based on known occurrence in the region and proximity to suitable habitat, which may include: (a) a persistent freshwater wetland, pond, or lake, or a perennial low or mid-gradient (<10%) channel, and (b) a corridor or multiple stands of hardwood trees and shrubs in	1	
		vegetated areas near surface water.		
F50	Groundwater Strength	Unlikely because site characteristics above are deficient, and/or this is a settled area or other area where beaver are routinely removed. Select first applicable choice:	0	Adhere to these criteria strictly do not use personal judgment based on fen conditions, pH, or other
	of Evidence	Springs are known to be present within the AA, or if groundwater levels have been monitored, that has demonstrated that groundwater primarily discharges to the wetland for longer periods during the year than periods when the wetland recharges the groundwater.	0	evidence. Consult topographic maps to detect breaks in slope described here. Rust deposits associated with groundwater seeps may be most noticeable as orange discoloration in ice formations along streams during early winter. [AM, CS, FA, FR, INV, NR, OE, PH, PRv, SFS, WC, WS]
		Most of the AA has a slope of >5%, or is very close to the base of a natural slope longer than 100 and much steeper than the slope of the AA, AND the pH of surface water, if known, is >5.5.	0	
F51	Internal Gradient	Neither of above is true, although some groundwater may discharge to or flow through the AA. Or groundwater influx is unknown. The gradient along most of the flow path within the AA is:	1	This is not the same as the shoreline slope. It is the elevational difference between the AA's inlet and
		<2% or the AA has no surface water outlet (not even seasonally).	1	outlet, divided by the flow-distance between them and converted to percent. If available, use a clinometer to measure this. Free clinometer apps can be downloaded to smartphones. If the wetland is
		2-5%. 6-10%.	0	large (longer than -1 km), this may be estimated using Google Earth to determine the minimum and
		6-10%.	0	maximum elevation within the AA, then dividing by length and multiplying by 100. [CS, NR, OE, PR, SR, WBF, WBN, WS]
		ions: If the AA lacks an upland edge, evaluate based on the AA's entire perimeter, and moving outward into whatever areas are		
adjace F52		nese questions are best answered by measuring from aerial images. Within a zone extending 30 m laterally from the AA's edge with upland and/or other wetlands, the percentage that contains perennial		[AM, FA, FR, INV, NRv, PH, POL, PRv, SBM, Sens, SRv, STR, WBN]
	of Perimeter	vegetation cover (except lawns, row crops, heavily grazed land, conifer plantations) is:

essor (S) Data Form for Non-Ti	dal Wetlands. WESP-AC for New B	runswick. Version 2.		Dat
Aberrant Timing of Water Inputs				Dat
<u> </u>	likely to have caused the timing of water inputs (but not necessarily their	ryaluma) ta chift by bours, days, or wooks, becoming either mare	mutad (cmaller or loce frequent peaks enread over langer time	
	ashy (larger or more frequent spikes but over shorter times). [FA, FR, IN]		muteu (smailer of less frequent peaks spread over longer lime.	
Stormwater from impervious surfaces that drains directly to the	ne wetland.			1
Water subsidies from wastewater effluent, septic system leak	age, snow storage areas, or irrigation.			
Regular removal of surface or groundwater for irrigation or ot	her consumptive use.			
	ning water body, or other control structure at water entry points that regu			
·	at from the wetland that interferes with surface or subsurface flow in/ou	t of the AA (e.g., road fill, wellpads, pipelines).		
Excavation within the wetland, e.g., dugout, artificial pond, de	aad-end diich.			
Artificial drains or ditches in or near the wetland.	internal channel (incised below the historical water table level).			
Logging within the wetland.	memai chamiei (inciseu below the historical water table level).			
	sult of machinery, livestock, fire, drainage, or off road vehicles.			
Straightening, ditching, dredging, and/or lining of tributary cha				
If any items were checked above, then for each row of the tab	le below, assign points. However, if you believe the checked items had n	o measurable effect on the timing of water conditions in any part o	of the AA, then leave the "O's" for the scores in the following row	S.
To estimate effects, contrast the current condition with the con	dition if the checked items never occurred or were no longer present. Severe (3 points)	Medium (2 points)	Mild (1 point)	
Spatial extent of timing shift within the wetland:	>95% of wetland.	5-95% of wetland.	Mild (1 point) <5% of wetland.	
When most of the timing shift began:	<3 yrs ago.	3-9 yrs ago.	10-100 yrs ago.	
ů ů	nin past 10 years, and only for the part of the wetland that experiences th	, ,	J.5 696.	
Input timing now vs. previously:	Shift of weeks.	Shift of days.	Shift of hours or minutes.	
Flashiness or muting:	Became very flashy or controlled.	Intermediate.	Became mildly flashy or controlled.

WETLAND CONDITION (EC)			3.49	Moderate		6.25
WETLAND RISK (average of Sensitivity & Stressors)			7.89	Higher		5.25
	NOTE: A scor	e of 0 does not	mean the func	tion or benefit i	s absent from t	ne wetland. It

NOTE: A score of 0 does not mean the function or benefit is absent from the wetland. It means only that this wetland has a capacity that is equal or less than the lowest-scoring one, for that function or benefit, from among the 98 NB calibration wetlands that were assessed previously.

Cover Page: Basic Description of Assessment	WESP-AC version 2
Site Name	Burchill Wind Energy Project - BB-W-02
Investigator Name	Derrick Mitchell
Date of Field Assessment	14 October 2019
Nearest Town	Lorneville (west Saint John), New Brunswick
Latitude (decimal degrees)	45.193464
Longitude (decimal degrees)	-66.201101
Is a map based on a formal on-site wetland delineation available?	Yes
Approximate size of the Assessment Area (AA, in hectares)	1.2
AA as percent of entire wetland (approx.). Attach sketch map if AA is smaller than the entire contiguous wetland	80
What percent (approx.) of the wetland were you able to visit?	80
What percent (approx.) of the AA were you able to visit?	100
Were you able to ask the site owner/manager about any of the questions?	No
Indicate here if you intentionally surveyed for rare plants, calciphile plants, or rare animals	Yes
Have you attended a WESP-AC training session? If so, indicate approximate month & year	Yes, September 2016
How many wetlands have you assessed previously using WESP-AC? (approx.	100+
Comments about the site or this WESP-AC assessment (attach extra page if desired)	

Form OF (Office). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Conduct an assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answering many of the questions below will equire using these online map viewers:

Google Earth Pro: https://www.google.com/earth/download/gep/agree.html

GeoNB: http://www.snb.ca/geonb1/ and http://www.snb.ca/geonb1/e/apps/apps-E.asp

Geons: http://www.snb.ca/geonol/ and http://www.snb.ca/geonol/e/apps/apps/apps-ta-asp For most wetlands, completing this office data form will require 1-2 hours. For a list of functions to which each question pertains, see bracketed abbreviations in the Definitions/Explanations column. For detailed descriptions of each WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity,

OF12	Wildlife Access	>500 m. Draw a circle of radius of 5 km from the center of the AA. If mammals and amphibians can move from the center of the AA to ALL other	0	In NB, enable the Wetlands layer in GeoNB (despite its omissions) to show surrounding wetlands an	
UF12	vviidille Access	unaw a circle of radius of s km from the center of the Avi. in maintains and ampinicans call move from the center of the Avi. of ALL other separate wellands and ponds located within the circle without being forced to cross pavement (any width), lawns, bare ground, and/or marine waters, mark 1 = yes can move to all, 0 = no. Change toblank if there are no other wellands within 5 km.	0	If the, enable the wellands layer in Gebrus (despite its offissions) to show surrounding wellands and roads, while estimating the location of the 5 km cicle (or draw the 5 km circle in Google Earth Pro using the Circle tool and compare). Evaluate using Google Earth, being cautious to search for roads hidden under forest canopy. [AM, SBM, STR]	
OF13	Distance to Ponded Water	The distance from the AA center to the closest (but separate) ponded water body visible in GoogleEarth imagery is:		In Google Earth, zoom in closely to examine the surrounding landscape for ponds, lakes, and wetlands that appear to be permanently flooded. Enable the GeoNB viewer's Wetlands layer as well	
	Water	<50 m, and not separated by any width of paved roads, stretches of open water, row crops, lawn, bare ground, or impervious surface.	0	[AM, PH, SBM, Sens, WBF, WBN]	
		<50 m, but completely separated by those features.	0		
		50-500 m, and not separated.	1		
		50-500 m, but separated by those features. 0.5 - 1 km. and not separated.	0		
		0.5 - 1 km, but separated by those features.	0		
		None of the above (the closest patches or corridors that large are >1 km away).	0		
OF14	Distance to Large Ponded Water	The distance from the AA center to the closest (but separate)non-tidal body of water that is ponded during most of the year and islarger than 8 hectares during most of a normal year is:		Determine this by viewing aerial imagery in Google Earth. [Sens, WBF, WBN]	
		<100 m.	0		
		100 m - 1 km.	1		
		1 -2 km. 2-5 km.	0		
		5-10 km.	0	1	
		>10 km.	0		
OF15	Tidal Proximity	The distance from the AA edge to the closesttidal water body (regardless of its salinity) is:		In Google Earth, measure the distance to the ocean (including Bay of Fundy) or tidal river, whichever is closer. If you need to see how far upriver a river is tidal, see the KMZ file provided with this	
		<100 m.	0	calculator for NB (NB Headtide). Points shown in those files are only an approximation, so local	
		100 m - 1 km. 1 - 5 km.	0	information if available may be preferable. [FA, WBF]	
		1 - 5 km. 5-10 km.	0		
		10-40 km.	0		
		>40 km.	0		
OF16	Upland Edge Contact	Select one:		[NR, SBM, Sens]	
		The AA has no upland edge (or upland is <1% of perimeter). The AA is entirely surrounded by (& contiguous with) other wetlands or water	. 0		
		1-25% of the AA's perimeter abuts upland (including filled areas). The rest adjoins other wetlands or water that is mostly wider than the AA	0		
		25-50% of the AA's perimeter abuts upland. The rest adjoins other wetlands or water that is mostly wider than the AA.	0		
		50-75% of the AA's perimeter abuts upland. The rest adjoins other wetlands or water that is mostly wider than the AA. More than 75% of the AA's perimeter abuts upland. Any remainder adjoins other wetlands or water that is mostly wider than the AA.This	0		
		will be true for most assessments done with WESP-AC.	'		
OF17	Flood Damage from Non-	Within 5 km downstream or downslope of the AA (select first true choice):		In the GeoNB map viewer: click on "More" in upper right, then "Flood Information". Expand the menu	
	tidal Waters	Maps show Flood Zone or Flood Risk areas and there appears to be infrastructure vulnerable to river flooding not caused by tidal storm surges.	0	under it by clicking on the arrow to its left and the slider to its right. Uncheck the first (Limits of Data) box. Where available, LiDAR imagery can provide finer elevational resolution useful for flood modeling, (WSv)	
		Maps show Flood Zone or Flood Risk areas, but infrastructure is absent or is not vulnerable to floods from a non-tidal river. In some cases	0	modeling. [WSV]	
		levees, upriver dams, or other measures may partly limit damage or risk from smaller events. Maps do not show Flood Zone or Flood Risk areas (or no such mapping has been done locally) and there appears to be infrastructure underable to river flooding unrelated to tidal storm surges.	0		
		Maps do not show Flood Zone or Flood Risk areas (or no such mapping has been done locally) and there isno infrastructure vulnerable to river flooding unrelated to tidal storm surges.	1		
OF18	Relative Elevation in Watershed	In Google Earth, enable the Terrain layer (jower left menu) and open the NB_Watersheds KMZ file that accompanies this calculator. Then determine the AA's approximate elevation (bottom right, NOT the "eye alt"). Then move cursor around to determine the watershed's maximum and minimum elevation. Divide the AA's elevation by the (max-min).	0.24	[FA, NR, Sens, SFSv, WCv, WSv]	
OF19	Water Quality Sensitive Watershed or Area	In Google Earth, open the KMZ file NB_Watershed Protected Area which accompanies this calculator. The AA is within such an area. Enter 1= yes, 0= no.	0	If an ACCDC report is available for this AA, it also may contain such information. [NRv]	
OF20	Degraded Water Upstream	Sampling indicates a problem with concentrations ofmetals, hydrocarbons, nutrients, or other substances (excluding bacteria, acidic water, high temperatures) being present at levels harmful to aquatic life or humans, and:		May use existing data, or sample those waters as part of this wetland assessment. "Harmful" should be evaluated with regard to current federal or provincial water quality standards. JAM, FA, FR, NRV,	
		The condition is present within the AA.	0	PRv, SRv, STR, WBF, WBN]	
		The condition is present in waters within 1 km that flowinto the AA, but has not been documented in the AA itself.	0		
		Sampling during both low water periods and times with high runoff (storms, snowmelt) indicates no problems in either the AA or inflowing waters.	0		
		Data are insufficient (no or inadequate sampling within 1 km, or condition exists only at >1 km upstream)This is the situation for nearly	1		
OF21	Degraded Water	all wetlands in this region. The problem described above is downslope from the AA, and:		May use existing data, or monitor waters as part of this wetland assessment. [NRv, PRv, SRv]	
	Downstream		1	g and, a manufacture per stress resident assessment. [rece, 1 (v) 5(v)]	
		The condition is present within 1 km downslope and connected to the AA by a channel. The condition is present within 5 km downslope and connected to the AA by a channel, or within 1 km but not connected to the AA by a	0		
		channel. Sampling during both low water periods and times with high runoff (storms, snowmelt) indicates no problems in either the AA or inflowing	0		
		waters. Data are insufficient (no or inadequate sampling within 1 km, or condition exists only at >1 km upstream)This is the situation for nearly	0		
OF22	Wetland as a % of Its	all wetlands in this region. From a topographic map and field observations, estimate the approximate boundaries of the catchment (CA) of the entire wetland of which		Topographic maps may be viewed online at the National Atlas of Canada (Toporama):	
	Contributing Area (Catchment)	the AA may be only a part. Then adjust those boundaries if necessary based on your field observations of the surrounding terrain, and/or busing procedures described in the Manual. Divide the area of the wetland (not just the AA) by the approximate area of its catchment excluding the area of the wetland itself. When doing the calculation, if ponded water is adjacent to the wetland, include that in the wetland area. The result is:	0	http://atlas.gc.ca/toporama/en/index.html [NR, PR, Sens, SR, WS]	
		<0.01, or catchment size unknown due to stormwater pipes that collect water from an indeterminate area. 0.01 to 0.1.	0		
		0.1 to 1.	1	1	
		>1 (wetland is larger than its catchment (e.g., wetland with flat surrounding terrain and no inlet, or is entirely isolated by dikes, or is a raised boq).	0		
OF23	Unvegetated Surface in the Contributing Area	usus. The proportion of the AA's contributing area (measured to no more than 1000 m upslope) that is comprised of buildings, roads, parking lots other pavement, exposed bedrock, landslides, and other mostly-bare surface is about:		[FA, INV, NRv, PRv, SRv, STR, WCv, WSv]	
	and Continualing Ared	<10%.	1		
		10 to 25%.	0		
		>25%.	0

Form F (Field). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Walk for no less than 10 minutes from the wetland edge towards its core, in the part of the AA that is proposed for alteration. If no alteration is proposed, walk in a portion that appears to be most representative of the wetland overall. Walk only where it is safe and legal to do so. Conduct the assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answer these questions primarily based on your onsite observations and interpretations. Do not write in shaded parts of this data form. Answering some questions accurately may require conferring with the landowner or other knowledgable persons and/or reviewing aerial imagery. For most wetlands, completing this field data form will require 1-2 hours on a site. For a list of functions to which each question pertains, see the accompanying Interpretations form. For detailed descriptions of each WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage & Delay, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity, STR= Stressors.

	T		1	
#	Indicators	Condition Choices	Data	Definitions/Explanations
F1	Wetland Type	Follow the key below and mark the ONE row that best describes MOST of the vegetated part of the AA:		Ericaceous shrubs are ones in the heather family (Ericaceae). Most have leathery evergreen leaves. They include rhododendron, azalea, swamp laurel, leatherleaf, Labrador tea, and others. Most require
		A. Moss and/or lichen cover more than 25% of the ground. Often dominated by ericaceous shrubs (e.g., Labrador tea) or other acid-tolerant plants (e.g., bog cranberry, pilcher plant, sundew, orchids). Substrate is mostly undecomposed peat. Choose between A1 and A2 and mark the choice with a 1 in their adjoining column. Otherwise go to B below.		They include include includent and in the family Ericaceae, sweetgale (<i>Myrica gale</i>) should be counted also. [AM, CS, FA, FR, NV, NR, OE, PH, Sens, SFS, WBF, WBN]
		A1. Surface water is usually absent or, if present, pH is typically < 4.5 and conductivity is usually <100 µS/cm (<64 ppm TDS). Trees are absent or nearly so. Sedge cover usually sparse or absent but cottongrass and/or lichen cover may be extensive, as well as cloudberry, lingonberry, sheep laurel, and a sedge (Carex rarillora). Welland surface and surrounding landscape are seldom sloping and welland often is domed (convex). Inlet and outlet channels are usually absent. If known, pH of peat is <4.0.	0	
		A2. Not A1. Surface water, if present, has pH typically >4.5 and conductivity is usually >100 µS/cm (>64 ppm TDS). Sedge cover is usually extensive, and/or tree and fall shrub cover is extensive. Sometimes at toe of slope or edge of water body. An exit channel is usually present. Wetter than A1 and peat depth may be shallower (<2 m).	0	
		B. Moss and/or lichen cover less than 25% of the ground. Soil is mineral or decomposed organic (muck). Choose between B1 and B2 and mark the choice with a 1 in their adjoining column:		
		B1. Trees and shrubs taller than 1 m comprise more than 25% of the vegetated cover. Surface water is mostly absent or inundates the vegetation only seasonally (e.g., vernal pools or floodplain).	1	
		B2. Not B1. Tree & tall shrubs comprise less than than 25% of the vegetated cover. Vegetation is mostly herbaceous, e.g., cattail, bulrush, burreed, pond lily, horsetail. Surface water may be extensive and fluctuates seasonally, being either persistent or drying up partly or entirely.	0	
AA sh includ " adja descri	ould also include part of le the open water part ad cent " is used synonymo ibed features along their	the AA should include all persistent waters in ponds smaller than 8 hectares (-283 m on a side) (hat are adjacent to the AA. The the water area of adjacent ponded water larger than 8 h and adjacent rivers wider than 20 m. Specifically, the AA should facent to welland vegetation and equal in width to the average width of that vegetated zone. Throughout this data form, usly with abutting, adjoining, bordering, contiguous and means no upland (manmade or natural) completely separates the directly shared edge. Features joined only by a channel are not necessarily considered to be adjacent a large portion of their res do not have to be hydrologically connected in order to be considered adjacent.		
F2	Wetland Types - Adjoining or Subordinate	If the AA is smaller than 1 ha, mark all other types that occupy more than 1% of the vegetated AA. If the AA is larger than 1 ha, mark all other types which are within or adjacent to the AA and occupy more than 1 ha, as visible from the AA or as interpreted from aerial imagery. Do not mark again the type marked in F1.		1 hectare is 10,000 sq. m or about 2.5 acres. It could have dimensions of 100 m by 100 m, 1000 m by 10 m, or similar. [AM, INV, SBM, WBF]
		A1. A2.	0	
		B1.	0	
F3	Woody Height & Form	B2. Following EACH row below, indicate with a number code the percentage of the living vegetation in the AA which is occupied by that feature (6	0	Deciduous shrubs in this region usually include buttonbush, Labrador tea, bayberry (Morella),
	Diversity	if >95%, 5 if 75-95%, 4 if 50-75%, 3 if 25-50%, 2 if 5-25%, 1 if <5%, 0 if none). If the vegetated part of the AA is largely herbaceous (non-woody) vegetation, these percentages should not sum to 100%. coniferous trees (may include tamarack) taller than 3 m.	4	huckleberry, cranberry, cloudberry, sweetgale, alder, willow, birch, ash, dogwood, and a few others. If you assigned a code of 3 or higher to any of the first four choices and the ground cover beneath the trees/shrubs is <25% moss, then question F1 might be "B1". [CS, INV, NR, PH, POL, SBM, Sens]
		deciduous trees (indy include faminalack) tailer trian 3 m.	3	
		coniferous or ericaceous shrubs or trees 1-3 m tall not directly below the canopy of trees.	1	
		deciduous shrubs or trees 1-3 m tall not directly below the canopy of trees. coniferous or ericaceous shrubs <1 m tall not directly below the canopy of taller vegetation.	0	
		deciduous shrubs or trees <1 m tall (e.g., deciduous seedlings) not directly below the canopy of taller vegetation.	0	
Note :	If none of top 4 rows in	F3 was marked 2 or greater, SKIP to F9 (N fixers).		
F4	Dominance of Most Abundant Shrub	Determine which two woody plant species comprise the greatest portion of the low (<3 m) woody cover . Then choose one: those species together comprise > 50% of such cover.	0	[PH, POL, SBM, Sens]
	Species	those species together do not comprise > 50% of such cover.	1	
F5	Woody Diameter Classes	Mark ALL the types that comprise >5% of the woody canopy cover in the AA or >5% of the wooded areas (if any) along its upland edge (perimeter). The edge should include only the trees whose canopies extend into the AA.		Estimate the diameters at chest height. If small-diameter trees are overtopped (shaded) by larger ones, visualise a "subcanopy" at the average height of the smaller-dbh trees, to serve as a basis for th
		coniferous, 1-9 cm diameter and >1 m tall.	1	minimum 5% canopy requirement in this question. The trees and shrubs need not be wetland species [AM, CS, POL, SBM, Sens, WBN]
		broad-leaved deciduous 1-9 cm diameter and >1 m tall. coniferous, 10-19 cm diameter.	1	. , . , . , . , . , . ,

FieldF form - Non-tidal Page 3 of 5

F37	Interspersion of	During most of the part of the growing season when water is present, the spatial pattern of emergent vegetation within the water is mostly:		[AM, FA, FR, INV, NR, OE, PH, PR, SBM, SR, WBF, WBN]
	Emergents & Open Water	Scattered. More than 30% of such vegetation forms small islands or corridors surrounded by water.	0	
	water	Intermediate.	0	
		Clumped. More than 70% of such vegetation is in bands along the wetland perimeter or is clumped at one or a few sides of the surface water area.	0	
F38	Persistent Deepwater	If the deepest patch of surface water (flowing or ponded) in or directly adjacent to the AA is mostly deeper than 0.5 m for >2 weeks during the	0	
F39	Area Non-vegetated Aquatic	growing season, enter "1" and continue. If not, enter "0" and SKIP to F42.(Connection). During most of the growing season and in waters deeper than 0.5 m, the cover for fish, aquatic invertebrates, and/or amphibians that is		For this question, consider only the wood that is at or above the water surface. Estimates of underwater
137	Cover	provided NOT by living vegetation, but by accumulations of dead wood and undercut banks is:		wood based only on observations from terrestrial viewpoints are unreliable so should not be attempted.
		Little or none. Intermediate.	0	[AM, FA, FR, INV]
		Extensive.	0	
F40	Isolated Island	The AA contains (or is part of) an island or beaver lodge within a lake, pond, or river, and is isolated from the shore by water depths > 1 m on all sides during an average June. The island may be solid, or it may be a floating vegetation mat that is sufficiently large and dense to support a waterbird nest.	0	[WBN]
	Duckweed	Al some time of the year, mats of algae and/or duckweed are likely to cover >50% of the AA's otherwise-unshaded water surface, or blanket >50% of the underwater substrate. If true, enter "1" in next column. If untrue or uncertain, enter "0".	0	[EC, PR, WBF]
F42	Channel Connection & Outflow Duration	The most persistent surface water connection (outlet channel or pipe, ditch, or overbank water exchange) between the AA and a downslope stream network is: [Note: If the AA represents only part of a welland, answer this according to whichever is the least permanent surface connection: the one between the AA and the rest of the wetland, or the surface connection between the wetland and the downslope stream network.] Persistent (surface water flows out for >9 months/year).	0	Consider the connection regardless of whether the surface water is frozen. The "downslope stream network" could consist of ditches, rivers, ponds, or lakes which eventually connect to the ocean. If this cannot be determined while visiting the AA, consult topographic maps perhaps by viewing these online with Toporama (http://atlas.nrcan.gc.ca/toporama/en/index.html) [CS, FA, FR, NR, OE, PR, Sens, SFS SR, WCv, WS]
		Seasonal (surface water flows out for 14 days to 9 months/year, not necessarily consecutive).	0	
		Temporary (surface water flows out for <14 days, not necessarily consecutive). None but maps show a stream network downslope from the AA and within a distance that is less than the AA's length. SKIP to F47 (pH	0	
		Measurement).		
		No surface water flows out of the wetland except possibly during extreme events (<once (ph="" 10="" a="" an="" ditch,="" f47="" flows="" into="" lacks="" lake="" measurement).<="" only="" or="" or,="" outlet.="" per="" skip="" td="" that="" to="" water="" wetland,="" years).=""><td>0</td><td></td></once>	0	
F43	Outflow Confinement	During major runoff events, in the places where surface water exits the AA or connected waters nearby, the water:		"Major runoff events" would include biennial high water caused by storms and/or rapid snowmelt. [CS, NR, OE, PR, Sens, SR, STR, WS]
		Mostly passes through a pipe, culvert, narrowly breached dike, berm, beaver dam, or other partial obstruction (other than natural topography) that does not appear to drain the wetland artificially during most of the growing season.	0	
		Leaves through natural exits (channels or diffuse outflow), not mainly through artificial or temporary features. Is exported more quickly than usual due to ditches or pipes within the AA or connected to its outlet, or within 10 m of the AA's edge, which	0	
		drain the wetland artificially, or water is pumped out of the AA.	U	
F44	Tributary Channel	At least once annually, surface water from a tributary channel that is >100 m long moves into the AA. Or, surface water from a larger permanent water body adjacent to the AA spills into the AA. If it enters only via a pipe, that pipe must be fed by a mapped stream or lake further upslope. If no, SKIP to F47 (pH Measurement).	0	If inlet tributaries cannot be searched for due to inaccessibility of part of the AA, follow suggestions in F42 above. [NRv, PH, PRv, SRv]
F45	Input Water Temperature	Based on lack of shade, water source characteristics, or actual temperature measurements, the inflow is likely to be warmer than surface water in the AA during part of most years. Enter 1= yes, 0= no.	0	[WCv]
F46	Throughflow	During its travel through the AA at the time of peak annual flow, water arriving in channels: [select only the ONE encountered by most of the incoming water].		[FA, FR, INV, NR, OE, PR, SR, WS]
	Resistance	Does not bump into many plant stems as it travels through the AA. Nearly all the water continues to travel in unvegetated (often incised)	0	
		channels that have minimal contact with welland vegetation, or through a zone of open water such as an instream pond or lake.		
		Bumps into herbaceous vegetation but mostly remains in fairly straight channels. Bumps into herbaceous vegetation and mostly spreads throughout, or is in widely meandering, multi-branched, or braided channels.	0	
		bumps into trendaceous vegeration and mostly spreads intrognour, or is in watery meanitiening, multi-maticited, or braided chainnels.	U	
		Bumps into tree trunks and/or shrub stems but mostly remains in fairly straight channels. Bumps into tree trunks and/or shrub stems and follows a fairly indirect path from entrance to exit (meandering, multi-branched, or braided).	0	
F47	pH Measurement	The pH in most of the AA's surface water:		Preferably, measure this in larger areas of ponded surface water within the AA, or in streams that have passed through (not along) most of the AA. Unless surface water is completely absent, do not dig holes
		Was measured, and is: [enter the reading in the column to the right.] Was not measured but surface water is present and is darkly tea-coloured. Or if no surface water, then mosses and plants that indicate	0	or make depressions in peat in order to provide water for this measurement. Avoid measuring near
		peatland (e.g., Labrador tea) are prevalent. Enter "1".		roads or in puddles formed only by recent rain. [AM, FA, FR, NR, WBF, PH, PR, Sens, WBF, WBN]
F48	TDS and/or	Neither of above. Enter "1". The TDS (total dissolved solids) or conductivity off the AA's surface water is: (select the first true row with information):	1	See above for measurement guidance. [FR, INV, NRv, PH, PRv, Sens]
	Conductivity	TDS is: [Enter the reading in ppm or mg/L in the column to the right, if measured, or answer next row.]		
		Conductivity is [Enter the reading in µS/cm in the column to the right.]	_	
		Was not measured, but plants that indicate saline conditions cover much of the vegetated AA. Enter *1". Neither of above	0	
F49	Beaver Probability	Use of the AA by beaver during the past 5 years is (select most applicable ONE):		[FA, FR, PH, SBM, Sens, WBF, WBN]
		Evident from direct observation or presence of gnawed limbs, dams, tracks, dens, lodges, or extensive stands of water-killed trees (snags).	0	
		Likely based on known occurrence in the region and proximity to suitable habitat, which may include: (a) a persistent freshwater wetland, pond, or lake, or a perennial low or mild-gradient (<10%) channel, and (b) a corridor or multiple stands of hardwood trees and shrubs in vegetated areas near surface water.	0	
Er.c	0 1 1 2	Unlikely because site characteristics above are deficient, and/or this is a settled area or other area where beaver are routinely removed.	1	
F50	Groundwater Strength of Evidence	Select first applicable choice: Springs are known to be present within the AA, or if groundwater levels have been monitored, that has demonstrated that groundwater primarily discharges to the wetland for longer periods during the year than periods when the wetland recharges the groundwater.	0	Adhere to these criteria strictly – do not use personal judgment based on fen conditions, pH, or other evidence. Consult topographic maps to detect breaks in slope described here. Rust deposits associated with groundwater seeps may be most noticeable as orange discoloration in ice formations along streams during each writer. (AM, CS, EA, EP, INV, NP, OF, EM, EPP, VFS, WC, WS)
		Most of the AA has a slope of >5%, or is very close to the base of a natural slope longer than 100 and much steeper than the slope of the AA, AND the pH of surface water, if known, is >5.5.	0	along streams during early winter. [AM, CS, FA, FR, INV, NR, OE, PH, PRv, SFS, WC, WS]
		Neither of above is true, although some groundwater may discharge to or flow through the AA. Or groundwater influx is unknown.	1	
F51	Internal Gradient	The gradient along most of the flow path within the AA is:		This is not the same as the shoreline slope. It is the elevational difference between the AA's inlet and outlet, divided by the flow-distance between them and converted to percent. If available, use a
		<2% or the AA has no surface water outlet (not even seasonally). 2-5%.	0	clinometer to measure this. Free clinometer apps can be downloaded to smartphones. If the wetland is large (longer than -1 km), this may be estimated using Google Earth to determine the minimum and
		6-10%.	0	maximum elevation within the AA, then dividing by length and multiplying by 100. [CS, NR, OE, PR,
Note fo	or the next three quest	>10%. ions: If the AA lacks an upland edge, evaluate based on the AA's entire perimeter, and moving outward into whatever areas are	0	SR, WBF, WBN, WS]
adjacei	nt. In many situations, th	nese questions are best answered by measuring from aerial images.		IAM FA FD INV ND, DIL DOL DD. CDM Core CD. CTD WDM
F52	Vegetated Buffer as % of Perimeter	Within a zone extending 30 m laterally from the AA's edge with upland and/or other wetlands, the percentage that contains perennial vegetation cover (except lawns, row crops, heavily grazed land, conifer plantations) is:		[AM, FA, FR, INV, NRv, PH, POL, PRv, SBM, Sens, SRv, STR, WBN]
		<5%.	0	
		5 to 30%. 30 to 60%.	0	
		60 to 90%. >90%, or all the area within 30 m of the AA edge is other wetlands. SKIP to F55.	0

FieldS form Non-tidal 2

Assessment Area (AA) Results:

Wetland ID: BB-W-02

Date: 14 October 2019 Observer: Derrick Mitchell

Latitude & Longitude (decimal degrees): 45.193464, -66.201101

Scores will appear below after data are entered in worksheets OF, F, and S. See Manual for definitions and descriptions of how scores were computed.

computeu.						
Wetland Functions or Other Attributes:	Function Score (Normalised)	Function Rating	Benefits Score (Normalised)	Benefits Rating	Function Score (raw)	Benefits Score (raw)
Water Storage & Delay (WS)	6.11	Higher	0.52	Lower	6.43	0.60
Stream Flow Support (SFS)	2.40	Lower	3.74	Moderate	1.28	2.18
Water Cooling (WC)	0.00	Lower	0.00	Lower	0.00	0.00
Sediment Retention & Stabilisation (SR)	6.75	Higher	10.00	Higher	7.78	10.00
Phosphorus Retention (PR)	4.98	Higher	10.00	Higher	6.44	10.00
Nitrate Removal & Retention (NR)	2.56	Moderate	10.00	Higher	5.41	10.00
Carbon Sequestration (CS)	8.20	Higher			8.10	
Organic Nutrient Export (OE)	5.97	Higher			5.50	
Anadromous Fish Habitat (FA)	0.00	Lower	0.00	Lower	0.00	0.00
Resident Fish Habitat (FR)	0.00	Lower	0.00	Lower	0.00	0.00
Aquatic Invertebrate Habitat (INV)	5.69	Higher	1.03	Moderate	5.87	1.80
Amphibian & Turtle Habitat (AM)	2.87	Lower	1.22	Lower	4.82	2.83
Waterbird Feeding Habitat (WBF)	0.00	Lower	0.00	Lower	0.00	0.00
Waterbird Nesting Habitat (WBN)	0.00	Lower	0.00	Lower	0.00	0.00
Songbird, Raptor, & Mammal Habitat (SBM)	7.23	Moderate	2.50	Lower	6.00	2.50
Pollinator Habitat (POL)	9.09	Higher	0.00	Lower	7.32	0.00
Native Plant Habitat (PH)	8.82	Higher	5.12	Moderate	6.64	4.44
Public Use & Recognition (PU)			2.07	Lower		1.80
Wetland Sensitivity (Sens)			0.67	Lower		2.40
Wetland Ecological Condition (EC)			7.11	Higher		8.33
Wetland Stressors (STR) (higher score means more stress)			0.22	Lower		2.34
Summary Ratings for Grouped Functions:						
HYDROLOGIC Group (WS)	2.40	Lower	0.52	Lower	6.43	0.60
WATER QUALITY SUPPORT Group (max+avg/2 of SR, PR, NR, CS)	5.76	Higher	10.00	Higher	7.51	10.00
AQUATIC SUPPORT Group (max+avg/2 of SFS, INV, OE, WC)	4.74	Moderate	2.66	Moderate	4.52	1.75
AQUATIC HABITAT Group (max+avg/2 of FA, FR, AM, WBF, WBN)	1.72	Lower	0.73	Lower	2.89	1.70
TRANSITION HABITAT Group (max+avg/2 of SBM, PH, POL)	8.73	Higher	3.83	Moderate	6.99	3.38
WETLAND CONDITION (EC)			7.11	Higher		8.33
WETLAND RISK (average of Sensitivity & Stressors)			0.44	Lower		2.37
·	NOTE A					

NOTE: A score of 0 does not mean the function or benefit is absent from the wetland. It means only that this wetland has a capacity that is equal or less than the lowest-scoring one, for that function or benefit, from among the 98 NB calibration wetlands that were assessed previously.

Cover Page: Basic Description of Assessment	WESP-AC version 2
Site Name:	Burchill Wind Energy Project - FC-Trib1-W-01
Investigator Name:	Matt Alexander
Date of Field Assessment:	12 September 2019
Nearest Town:	Lorneville (west Saint John), New Brunswick
Latitude (decimal degrees):	45.186357
Longitude (decimal degrees):	66.207911
Is a map based on a formal on-site wetland delineation available?	Yes
Approximate size of the Assessment Area (AA, in hectares):	1.2
AA as percent of entire wetland (approx.). Attach sketch map if AA is smaller than the entire contiguous wetland.	100
What percent (approx.) of the wetland were you able to visit?	100
What percent (approx.) of the AA were you able to visit?	100
Were you able to ask the site owner/manager about any of the questions?	No
Indicate here if you intentionally surveyed for rare plants, calciphile plants, or rare animals:	Yes
Have you attended a WESP-AC training session? If so, indicate approximate month & year.	Yes, September 2016
How many wetlands have you assessed previously using WESP-AC? (approx.)	15
Comments about the site or this WESP-AC assessment (attach extra page if desired):	

Form OF (Office). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Conduct an assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answering many of the questions below will require using these online map viewers:

vestigator: Matt Alexander

Google Earth Pro: https://www.google.com/earth/download/gep/agree.html

GeoNB: http://www.snb.ca/geonb1/ and http://www.snb.ca/geonb1/e/apps/apps-E.asp

)F1	Indicators	Condition Choices	Data	Definitions/Explanations
	Province	Mark the province in which the AA is located by changing the 0 in the column next to it to a "1". Mark only one.		This determines to which province's calibration wetlands the raw score of any wetland is normalise
ı		New Brunswick	1	In the function and benefits models, it also triggers the automatic exclusion of indicators for which spatial data exists in a particular province.
		Nova Scotia	0	spatial data exists in a particular province.
		Prince Edward Island	0	
		Newfoundland-Labrador	0	
2	Ponded Area Within 1 km.	The area of surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) within 1 km is:		"Adjacent" means not separated from the AA by a wide expanse (>50 m) of upland (including rox >50 m wide). Include ponded areas likely to be hidden by wetland vegetation. If surface water
		<0.01 hectare (about 10 m x 10 m).	0	extends beyond 1 km, include only the part within 1 km. Do not include tidal areas. Measure the
		0.01 - 0.1 hectare.	0	from aerial imagery using Google Earth Pro (click on Ruler icon in toolbar, then Polygon in pop-up
		0.1 - 1 hectare.	- 1	menu). With the GeoNB viewer, enable the Wetlands layer, then measure with the Draw & Measi tool after specifying Aerial as the Basemap. However, do not rely entirely on wetland boundaries
		1 to 10 hectares.	0	shown in online wetlands layers. [PH, SBM, WBN]
		10 to 100 hectares.	0	, , , , , , , ,
		>100 hectares.	0	1
3	Ponded Water & Wetland Within 1 km.	The area of wetlands and surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) within the is:	n	See definition of adjacent in OF2. If the AA's wetland vegetation extends beyond 1 km, include o the part within 1 km. "Ponded" means not flowing in rivers or streams. [Sens, WBF]
		<0.01 hectare (about 10 m x 10 m).	0	
		0.01 - 0.1 hectare.	0	
		0.1 - 1 hectare.	1	
		1 to 10 hectares.	0	1
		10 to 100 hectares.	0	1
		>100 hectares.	0	1
4	Size of Largest Nearby Vegetated Tract or	The largest vegetated patch or corridor that includes the AA's vegetation plus aladjacent upland vegetation that is not lawn, row crops, neavily grazed lands, conifer plantation is:		See definition of adjacent in OF2. Use Google Earth Pro's polygon ruler (as described above). Exclude conifer plantations only if it is obvious that trees were planted in rows. [AM, PH, SBM, Se
	Corridor	<0.01 hectare (about 10 m x 10 m).	0	
		0.01 - 0.1 hectare.	0	1
		0.1 - 1 hectare.	0	1
		1 to 10 hectares.	0	1
		10 to 100 hectares.	0	1
		100 to 1000 hectares.	0	1
		>1000 hectares. [This is nearly always the answer in relatively undeveloped landscapes]	1	
5	Distance to Large	The minimum distance from the edge of the AA to the edge of the closest vegetated land (but excluding row crops, lawn, conifer		To measure distance, use Google Earth Pro (Ruler > Line tool). Or use Draw & Measure tool at
	Vegetated Tract	plantation) larger than 375 hectares (about 2 km on a side), is:		GeoNB. The 375-ha criterion is from the Fundy Model Forest Project. [AM, PH, POL, SBM, Sens
		450 m, and not separated from the 375-ha vegetated area by any width opaved roads, stretches of open water, row crops, bare ground, lawn, or impervious surface. Or the AA itself contains >375 ha of vegetation. [This is often the answer in relatively undeveloped landscaped to the contains of the con	1	
		<50 m, but completely separated from the 375-ha vegetated area by those features, and AA does not contain >375 ha of vegetation.	0	
		50-500 m, and not separated.	0	1
		50-500 m, but separated by those features.	0	1
		0.5 - 5 km, and not separated.	0	
		0.5 - 5 km, but separated by those features.	0	
		None of the above (the closest patches or corridors which are that large are >5 km away).	0	
6	Herbaceous Uniqueness	The AA's vegetation cover is >10% herbaceous* but uplands within 5 km have <10% herbaceous cover. If so, enter "3" and continue to OF7. If not, consider: The AA's vegetation cover is >10% herbaceous* but uplands within 1 km have <10% herbaceous cover. If so enter "2" and continue to OF7. If not, consider:	0	For this question only, consider moss to be herbaceous vegetation. Determine the score by view aerial imagery in Google Earth after successively drawing or estimating the boundaries of the but of 5 km, 1 km, and 100 m radius focused on the center of the AA. Circles of specified radius can
		The Afx segetation cover is >10% herbaceous* but uplands within 100 m of the wetland edge have <10% herbaceous cover. If so, ente "1". [* NOTE: Exclude lawns, row crops, heavily grazed lands, forest, shrublands. OF11	Distance to Nearest	From the center of the AA, the distance to the nearest maintained public road (dirt or paved) is:		Determine this by viewing aerial imagery in Google Earth and measuring with the Ruler>Line tool. Or
	Maintained Road	<10 m.	1	use the GeoNB's Draw Line tool. [AM, FAv, FRv, NRv, PH, PU, SBM, STR, WBN]
		10 - 25 m.	0	
		25 - 50 m.	0	
		50 - 100 m.	0	
		100 - 500 m. >500 m.	0	
OF12	Wildlife Access	Draw a circle of radius of 5 km from the center of the AA. If mammals and amphibians can move from the center of the AA to ALL other	U	In NB, enable the Wetlands layer in GeoNB (despite its omissions) to show surrounding wetlands an
01.12	Trialio / tooss	separate wetlands and ponds located within the circle without being forced to cross pavement (any width), lawns, bare ground, and/or marine waters, mark 1 = yes can move to all, 0 = no. Change toblank if there are no other wetlands within 5 km.	0	roads, while estimating the location of the 5 km circle (or draw the 5 km circle in Google Earth Pro using the Circle tool and compare). Evaluate using Google Earth, being cautious to search for roads hidden under forest canopy. [AM, SBM, STR]
OF13		The distance from the AA center to the closest (but separate) ponded water body visible in GoogleEarth imagery is:		In Google Earth, zoom in closely to examine the surrounding landscape for ponds, lakes, and
	Water	< 50 m, and not separated by any width of paved roads, stretches of open water, row crops, lawn, bare ground, or impervious surface.	0	wellands that appear to be permanently flooded. Enable the GeoNB viewer's Wetlands layer as wel [AM, PH, SBM, Sens, WBF, WBN]
		<50 m, but completely separated by those features.	1	
		50-500 m, and not separated. 50-500 m, but separated by those features.	0	
		0.5 - 1 km, and not separated.	0	
		0.5 - 1 km, but separated by those features.	0	
		None of the above (the closest patches or corridors that large are >1 km away).	0	
OF14	Distance to Large Ponded Water	The distance from the AA center to the closest (but separate)non-tidal body of water that is ponded during most of the year and islarger than 8 hectares during most of a normal year is:		Determine this by viewing aerial imagery in Google Earth. [Sens, WBF, WBN]
		<100 m.	0	
		100 m - 1 km. 1 - 2 km.	1	
		2-5 km.	0	
		5-10 km.	0	
		>10 km.	0	
OF15	Tidal Proximity	The distance from the AA edge to the closesttidal water body (regardless of its salinity) is:		In Google Earth, measure the distance to the ocean (including Bay of Fundy) or tidal river, whichever is closer. If you need to see how far upriver a river is tidal, see the KMZ file provided with this
		<100 m.	0	is closer. If you need to see how far upriver a river is tidal, see the KMZ file provided with this calculator for NB (NB Headtide). Points shown in those files are only an approximation, so local
		100 m - 1 km.	0	information if available may be preferable. [FA, WBF]
		1 - 5 km.	1	
		5-10 km. 10-40 km.	0	
		>40 km.	0	
OF16	Upland Edge Contact	Select one:		[NR, SBM, Sens]
		The AA has no upland edge (or upland is <1% of perimeter). The AA is entirely surrounded by (& contiguous with) other wetlands or water	0	
		1-25% of the AA's perimeter abuts upland (including filled areas). The rest adjoins other wetlands or water that is mostly wider than the AA	0	
		25-50% of the AA's perimeter abuts upland. The rest adjoins other wetlands or water that is mostly wider than the AA.	0	
		50-75% of the AA's perimeter abuts upland. The rest adjoins other wetlands or water that is mostly wider than the AA.	0	
		More than 75% of the AA's perimeter abuts upland. Any remainder adjoins other wetlands or water that is mostly wider than the AA.This will be true for most assessments done with WESP-AC.		
OF17	Flood Damage from Non-			In the GeoNB map viewer: click on "More" in upper right, then "Flood Information". Expand the menu
	tidal Waters	Maps show Flood Zone or Flood Risk areas and there appears to be infrastructure vulnerable to river flooding not caused by tidal storm surges.	0	under it by clicking on the arrow to its left and the slider to its right. Uncheck the first (Limits of Data) box. Where available, LiDAR imagery can provide finer elevational resolution useful for flood modeling, (WSv)
		Maps show Flood Zone or Flood Risk areas, but infrastructure is absent or is not vulnerable to floods from a non-tidal river. In some cases levees, upriver dams, or other measures may partly limit damage or risk from smaller events.	0	mouning. [1101]
		Maps do not show Flood Zone or Flood Risk areas for no such mapping has been done locally) and there appears to be infrastructure vulnerable to river flooding unrelated to tidal storm surges. Maps do not show Flood Zone or Flood Risk areas (or no such mapping has been done locally) and there ino infrastructure vulnerable	0	
OF18	Relative Elevation in	to river flooding unrelated to tidal storm surges. In Google Earth, enable the Terrain layer (lower left menu) and open the NB_Watersheds KMZ file that accompanies this calculator. Then		[FA, NR, Sens, SFSv, WCv, WSv]
0540	Watershed	determine the AA's approximate elevation (bottom right, NOT the "eye alt"). Then move cursor around to determine the watershed's maximum and minimum elevation. Divide the AA's elevation by the (max-min).	0.15	
OF19 OF20	Water Quality Sensitive Watershed or Area Degraded Water	In Google Earth, open the KMZ file NB_Watershed Protected Area which accompanies this calculator. The AA is within such an area. Enter 1= yes, 0= no. Sampling indicates a problem with proportioning of mobile, but no proportions and indicates a problem with proportions of mobile.	0	If an ACCDC report is available for this AA, it also may contain such information. [NRv]
J1 ZU	Upstream	Sampling indicates a problem with concentrations ofmetals, hydrocarbons, nutrients, or other substances (excluding bacteria, acidic water, high temperatures) being present at levels harmful to aquatic life or humans, and:		May use existing data, or sample those waters as part of this wetland assessment. "Harmful" should be evaluated with regard to current federal or provincial water quality standards. [AM, FA, FR, NRv,
		The condition is present within the AA.	0	PRv, SRv, STR, WBF, WBN]
		The condition is present in waters within 1 km that flowinto the AA, but has not been documented in the AA itself.	0	
		Sampling during both low water periods and times with high runoff (storms, snowmelt) indicates no problems in either the AA or inflowing waters.	0	
		Data are insufficient (no or inadequate sampling within 1 km, or condition exists only at >1 km upstream)This is the situation for nearly	1	
OF21	Degraded Water	all wetlands in this region. The problem described above is downslope from the AA, and:		May use existing data, or monitor waters as part of this wetland assessment. [NRv, PRv, SRv]
0121	Downstream			inay ase existing data, or monitor waters as part or this wettand assessment. [NTV, TTV, STV]
		The condition is present within 1 km downslope and connected to the AA by a channel. The condition is present within 5 km downslope and connected to the AA by a channel, or within 1 km but not connected to the AA by a	0	
		The common is present within 3 km downstope and connected to the AA by a channel. Sampling during both low water periods and times with high runoff (storms, snowmelt) indicates no problems in either the AA or inflowing	0	
		waters. Data are insufficient (no or inadequate sampling within 1 km, or condition exists only at >1 km upstream)This is the situation for nearly	1	
0.55		all wetlands in this region.		
OF22	Wetland as a % of Its Contributing Area (Catchment)	From a topographic map and field observations, estimate the approximate boundaries of the catchment (CA) of the entire wetland of which AM may be only a part. Then adjust those boundaries if necessary based on your field observations of the surrounding and/or busing procedures described in the Manual. Divide the area of the wetland (not just the AA) by the approximate area of its catchment excluding the area of the wetland itself. When doing the calculation, if ponded water is adjacent to the wetland, include that in the wetland area. The result is:		Topographic maps may be viewed online at the National Altas of Canada (Toporama): http://attas.gc.ca/toporama/en/index.html [NR, PR, Sens, SR, WS]
		<0.01, or catchment size unknown due to stormwater pipes that collect water from an indeterminate area.	0	
		0.01 to 0.1.	1	
		0.1 to 1. >1 (wetland is larger than its catchment (e.g., wetland with flat surrounding terrain and no inlet, or is entirely isolated by dikes, or is a raised	0	
OF23	Unvegetated Surface in	In the proportion of the AA's contributing area (measured to no more than 1000 m upslope) that is comprised of buildings, roads, parking lots.	Ü	[FA, INV, NRv, PRv, SRv, STR, WCv, WSv]
	the Contributing Area	other pavement, exposed bedrock, landslides, and other mostly-bare surface is about : <10%.	1	
		10 to 25%.	0	
		>25%.	0	

OF24	Transport From Upslope	A relatively large proportion of the precipitation that falls farther upslope in the CA reaches this wetland quickly as runoff (surface water), as		[NRv, PRv, SRv, WSv]
		indicated by the following: (a) input channel is present,		
		(b) input channels have been straightened,		
		(c) upslope wetlands have been ditched extensively, (d) land cover is mostly non-forest,		
		(e) CA slopes are steep, and/or		
		(f) most CA soils are shallow (bedrock near surface) and/or have high runoff coefficients.		
		This statement is:		
		Mostly true.	0	
		Somewhat true.	0	
		Mostly untrue.	1	
OF25	Aspect	The overland flow direction of most surface water (in streams, rivers, or runoff) that enters the AA is:		[AM, NR, SFS, WC, WS]
		Northward (N, NE). north-facing contributing area.	1	
		Southward (S, SW). south-facing contributing area.	0	
0527	Internal Flow Distance	Other (E, SE, W, NW), or no detectable uphill slope or input channel (flat).	0	
OF26	(Path Length)	The horizontal flow distance from the wetland's inlet to outlet is:		Identify inlets and outlets, if any, from topographic maps (use elevations to determine which are inlet and which are outlets) and augment by field inspection. [NR, OE, PR, SR, WS]
	, , ,	<10 m.	0	
		10 - 50 m. 50 - 100 m.	0	
		100 - 1000 m.	1	
		1- 2 km.	0	
		>2 km, or wetland lacks an inlet and outlet.	0	
OF27	Growing Degree Days	In Google Earth, open the KMZ file that accompanies this calculator, called NB-PEL_GrowingDegreeDays. Place your cursor over the AA and left-click. From the pop-up, enter the GRIDCODE in the next column.	2314	This layer was provided by Dr. Dan McKenney of the Canadian Forest Service [AM, CS, FR, INV, NR, OE, PH, PR, Sens, SR, WBF, WCV, WS]
OF28	Fish Access or Use	According to agency biologists and/or your own observations, the AA. [Nark just the first choice that is true.]:		Regarding the last choice, if uncertain if an AA is fishless, consider the possibility its waters have been cheeked. In NR, the list of sheeked waters is at
		Is known to support rearing and/or spawning by Atlantic salmon or other anadromous species or eels. In NB, consult Figure A-2 in	0	stocked. In NB, the list of stocked waters is at: http://www2.gnb.ca/content/gnb/en/departments/erd/natural_resources/content/fish/content/Stocked/
		Appendix A of the Manual. Contact local fishery biologists, review the ACCDC report, and visit these websites: http://www.salmonatlas.com/atlanticsalmon/canada-east/index.1.html http://atlanticsalmonfederation.org/rivers/introduction.html	l	aters.html
		nttp://www.saimonatias.com/atlanticsaimon/canada-eas/index.1.ntml nttp://atlanticsaimonrederation.org/rivers/introduction.ntml Has not been documented to support Atlantic salmon rearing and/or spawning, but is connected to nearby waters likely to contain Atlantic	1	[AM, FA, FR, INV, WBF, WBN]
		Has not been documented to support Atlantic salmon rearing and/or spawning, but is connected to hearby waters likely to contain Atlantic salmon or other anadromous species or eels and is probably accessed by those during some conditions.		
		Is probably is not accessed by any anadromous fish species but is known or likely to havether fish at least seasonally.	0	
		Is known or likely to be fishless (e.g., too small, dry, and/or not accessible even temporarily, and not stocked).	0	
OF29	Species of Conservation	Within the past 10 years, in the AA (or in its adjoining waters or wetland), qualified observers have documented mark all applicable:		Request information from ACCDC and/or conduct your own survey at an appropriate season using a
	Concern			approved protocol. For birds, also check eBird.org. [AMv, EC, PHv, POLv, SBMv, Sens, WBFv, WBNv]
		Presence of one or more of the plant species listed in the Plants_Rare worksheet of the accompanying Supplnfo file, or the AA is within a mapped Atlantic Coastal Plain Flora Buffer	0	,
		Presence of one or more of the amphibian or reptile species (AM) of conservation concern as listed in the Wildlife_Rare worksheet of the	0	
		accompanying Supplinfo file. Presence of one or more of the waterbird species (WBF, WBN) of conservation concern as listed in the Wildlife_Rare worksheet of the	0	
		accompanying Supplinfo file.		
		Presence of one or more of the nesting songbird or raptor species (SBM) of conservation concern as listed in the Wildlife_Rare workshee	0	
		of the accompanying Supplnfo file, during their nesting season (May-July for most species). None of the above, or no data.	1	
OF30	Important Bird Area	In Google Earth, open the KMZ file that accompanies this calculator, called BAs_Canada. The AA is all or part of an officially designated	0	The source of this layer, which should be checked periodically for updates, is:
	(IBA)	IBA. Enter 1= yes, 0= no.	_	http://www.ibacanada.com/mapviewer.jsp?lang=EN [SBMv, WBFv, WBNv]
OF31	Black Duck Nesting Area	In Google Earth, open the KMZ file that accompanies this calculator, called BlackDuck. Adjust its alignment and opacity, Determine the predicted density (pairs per 25 sq. km) of nesting American Black Duck in the AA's vicinity, <10 (enter 0), 10-20 (enter 1), 20-30 (enter 2), 15 (outside of region shown in map, change toblants.	0	This was provided by Dr. David Leske. [WBNv]
OF32	Wintering Deer or Moose Concentration Areas	If AA is on private land with no information, change to blank (not 0). If on publicicrown land, in Google Earth open the KMZ file that accompanies this report called NB_DeerWinterIngAreas. Otherwise: Enter: yes= 1, no= 0.	0	[SBM]
OF33	Other Conservation	With GeoNB, click on Candidate PNA Map Viewer to identify Provincially Significant Wetland, Environmentally Significant Area, Protected	0	[PU]
	Designation	Natural Area – but also include if the AA is all or part of an area designated by government, First Nations, or the Nature Conservancy of Canada (NCC) for its exceptional ecological features or highly intact natural conditions. Enter: yes= 1, no= 0. If uncertain, consult NCC ar agencies for more recent information.		
OF34	Conservation Investment	The AA is part of or contiguous to a wetland on which public or private organizational funds were spent to preserve, create, restore, or enhance the wetland (excluding mitigation wetlands). Ask the property owner. Enter: yes= 1, no= 0. If no information, change thank (not 0).	0	[PU]
OF35	Mitigation Investment	The AA is all or part of a mitigation site used explicitly to offset impacts elsewhere. Ask the property owner. Enter: yes= 1, no= 0. If no information, change to blank.	0	[PU]
OF36	Sustained Scientific Use	Plants, animals, or water in the AA have been monifored for >2 years, unrelated to any regulatory requirements, and data are available to the public. Or the AA is part of an area that has been designated by an agency or institution as a benchmark, reference, or status-trends moniforing area. Ask the property owner. Enter: yes=1, no=0. If no information, change toblank.	0	[PU]
OF37	Calcareous Region	The AA is in an area that is at least partly underlain by soil, sediment, or bedrock that is highly calcareous (enter 3 in next column), moderately calcareous (enter 2), or slightly calcareous (enter 1), none= 0. Limestone is typically a major component (karst geology) and water is not acidic (pH is usually >8). See Figure A-6 in Appendix A of the Manual. If no map coverage, change tablank.	0	If GIS is available, you may use the Bedrock Geology shapefile obtainable at http://www.snb.ca/geonb1/e/DC/catalogue-E.asp [AM, FA, FR, INV, PH]
OF38	Ownership	Select the ONE ownership that covers the most of the AA. In Google Earth, open KMZ file called NB Crown lands Use more recent information if available.		"Private lands" may include those owned or leased by non-governmental organizations, e.g., charitable conservation land trusts, DUC, TNC. [PU, STR]
		New limber harvest, roads, mineral extraction, and intensive summer recreation (e.g., off-road vehicles) are permanently prohibited. Includes many publicly-owned Protected Lands, and private lands under long-term (30+ year) legal agreements to maintain nearly-unaliter conditions.	0	
		Conditions. Ownership is public (e.g., municipal, Crown Reservations/Notations) but some or all of the above activities are allowed.	1	
		Ownership is private but public access is allowed, and/or a shorter-term conservation easement (whether renewable or not) is in place.	0	
		Ownership is private and owner does not allow access, or access permission unknown, and not a conservation easement.	0	

Date: 12 Sept 2019	Site Identifier: FC-Trib1-W-01	Investigator:	Matt Alexand	le

Form F (Field). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Walk for no less than 10 minutes from the wetland edge towards its core, in the part of the AA that is proposed for alteration. If no alteration is proposed, walk in a portion that appears to be most representative of the wetland overall. Walk only where it is safe and legal to do so. Conduct the assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answer these questions primarily based on your onsite observations and interpretations. Do not write in shaded parts of this data form. Answering some questions accurately may require conferring with the landowner or other knowledgable persons and/or reviewing aerial imagery. For most wetlands, completing this field data form will require 1-2 hours on a site. For a list of functions to which each question pertains, see the accompanying Interpretations form. For detailed descriptions of each WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage & Delay, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity, STR= Stressors.

	to die	Condition of the	D. I	Definitions in 1
#	Indicators	Condition Choices	Data	Definitions/Explanations
1	Wetland Type	Follow the key below and mark the ONE row that best describes MOST of the vegetated part of the AA:		Ericaceous shrubs are ones in the heather family (Ericaceae). Most have leathery evergreen leaves. They include rhododendron, azalea, swamp laurel, leatherleaf, Labrador tea, and others. Most require
		A. Moss and/or lichen cover more than 25% of the ground. Often dominated by ericaceous shrubs (e.g., Labrador tea) or other acid-tolerant plants (e.g., bog cranberry, pitcher plant, sundew, orchids). Substrate is mostly undecomposed peat. Choose between A1 and A2 and mark the choice with a 1 in their adjoining column. Otherwise go to B below.		acidic soil. Although not in the family Ericaceae, sweetgale (<i>Myrica gale</i>) should be counted also. [AM, CS, FA, FR, INV, NR, OE, PH, Sens, SFS, WBF, WBN]
		A1. Surface water is usually absent or, if present, pH is typically <4.5 and conductivity is usually <100 µS/cm (<64 ppm TDS). Trees are absent or nearly so. Sedge cover usually sparse or absent but cottongrass and/or lichen cover may be extensive, as well as cloudberry, lingonberry, sheep laurel, and a sedge (Carex rarillora). Welfand surface and surrounding landscape are seldom sloping and welfand often is domed (convex). Inlet and outlet channels are usually absent. If known, pH of peat is <4.0.	0	
		A2. Not A1. Surface water, if present, has pH typically >4.5 and conductivity is usually >100 µS/cm (>64 ppm TDS). Sedge cover is usually extensive, and/or tree and fall shrub cover is extensive. Sometimes at toe of slope or edge of water body. An exit channel is usually present. Wetter than A1 and peat depth may be shallower (<2 m).	0	
		B. Moss and/or lichen cover less than 25% of the ground. Soil is mineral or decomposed organic (muck). Choose between B1 and B2 and mark the choice with a 1 in their adjoining column:		
		B1. Trees and shrubs taller than 1 m comprise more than 25% of the vegetated cover. Surface water is mostly absent or inundates the vegetation only seasonally (e.g., vernal pools or floodplain).	1	
		B2. Not B1. Tree & tall shrubs comprise less than than 25% of the vegetated cover. Vegetation is mostly herbaceous, e.g., cattail, bulrush, burreed, pond lily, horsetail. Surface water may be extensive and fluctuates seasonally, being either persistent or drying up partly or entirely.	0	
NA sh nclud adja lescn	ould also include part of it the open water part adj cent " is used synonymou bed features along their it	the AA should include all persistent waters in ponds smaller than 8 hectares (-283 m on a side) that are adjacent to the AA. The the water area of adjacent ponded water larger than 8 ha and adjacent rivers wider than 20 m. Specifically, the AA should jacent to wetland vegetation and equal in width to the average width of that vegetated zone. Throughout this data form, usly with abutting, adjoining, bordering, contiguous and means no upland (manmade or natural) completely separates the directly shared edge. Features joined only by a channel are not necessarily considered to be adjacent a large portion of their res do not have to be hydrologically connected in order to be considered adjacent.		
2	Wetland Types - Adjoining or Subordinate	If the AA is smaller than 1 ha, mark all other types that occupy more than 1% of the vegetated AA. If the AA is larger than 1 ha, mark all other types which are within or adjacent to the AA and occupy more than 1 ha, as visible from the AA or as interpreted from aerial imagery. Do not mark again the type marked in F1.		1 hectare is 10,000 sq. m or about 2.5 acres. It could have dimensions of 100 m by 100 m, 1000 m by 10 m, or similar. [AM, INV, SBM, WBF]
		A1. A2.	0	
		B1.	0	
2	Woody Height & Form	B2. Following EACH row below, indicate with a number code the percentage of the living vegetation in the AA which is occupied by that feature (6	0	Deciduous shrubs in this region usually include buttonbush, Labrador tea, bayberry (Morella),
3	Diversity	if >95%, 5 if 75-95%, 4 if 50-75%, 3 if 25-50%, 2 if 5-25%, 1 if <5%, 0 if none). If the vegetated part of the AA is largely herbaceous (non-woody) vegetation, these percentages should not sum to 100%.		Decladous stricts in this region losality include distinctions, Labriator lea, adjusting (worked), huckleberry, cranberry, cloudberry, sweetgale, alder, willow, birch, ash, dogwood, and a few others. If you assigned a code of 3 or higher to any of the first four choices and the ground cover beneath the threes/shrubs is <25% moss, then question F1 might be "B1". [CS, INV, NR, PH, POL, SBM, Sens]
		coniferous trees (may include tamarack) taller than 3 m. deciduous trees taller than 3 m.	2	
		coniferous or ericaceous shrubs or trees 1-3 m tall not directly below the canopy of trees.	3	
		deciduous shrubs or trees 1-3 m tall not directly below the canopy of trees. coniferous or ericaceous shrubs <1 m tall not directly below the canopy of taller vegetation.	2	
		deciduous shrubs or trees <1 m tall (e.g., deciduous seedlings) not directly below the canopy of taller vegetation.	2	
lote :		F3 was marked 2 or greater, SKIP to F9 (N fixers).		
4	Dominance of Most Abundant Shrub	Determine which two woody plant species comprise the greatest portion of the low (<3 m) woody cover . Then choose one:		[PH, POL, SBM, Sens]
	Species	those species together comprise > 50% of such cover. those species together do not comprise > 50% of such cover.	0	
5	Woody Diameter Classes	Mark ALL the types that comprise >5% of the woody canopy cover in the AA or >5% of the wooded areas (if any) along its upland edge (perimeter). The edge should include only the trees whose canopies extend into the AA.		Estimate the diameters at chest height. If small-diameter trees are overtopped (shaded) by larger ones, visualise a "subcanopy" at the average height of the smaller-dbh trees, to serve as a basis for the smaller-dbh trees, to serve as a basis for the smaller-dbh trees.
		coniferous, 1-9 cm diameter and >1 m tall. broad-leaved deciduous 1-9 cm diameter and >1 m tall.	1	minimum 5% canopy requirement in this question. The trees and shrubs need not be wetland specie [AM, CS, POL, SBM, Sens, WBN]
		coniferous, 10-19 cm diameter.	1	
		broad-leaved deciduous 10-19 cm diameter.	1	
		coniferous, 20-40 cm diameter. broad-leaved deciduous 20-40 cm diameter.	0	
		coniferous, >40 cm diameter.	1	
	Halahi Olasa	broad-leaved deciduous >40 cm diameter.	0	TAM INIV NO DIL COM Coord
D	Height Class Interspersion	Follow the key below and mark the ONE row that best describes MOST of the AA: A. Neither the vegetation taller than 1 m nor the vegetation shorter than that comprise >70% of the vegetated part of the AA. They each comprise 30-70%. Choose between A1 and A2 and mark the choice with a 1 in the adjoining column. Otherwise go to B below.		[AM, INV, NR, PH, SBM, Sens]
		A1. The two height classes are mostly scattered and intermixed throughout the AA.	1	
		A2. Not A1. The two height classes are mostly in separate zones or bands, or in proportionately large clumps.	0	
		B. Either the vegetation shorter than 1 m comprises >70% of the vegetated part of the AA, or the vegetation taller than that does. One size		
		class might even be totally absent. Choose between B1 and B2 and mark the choice with a 1 in the adjoining column:		
		class might even be totally absent. Choose between B1 and B2 and mark the choice with a 1 in the adjoining column: B1. The less prevalent height class is mostly scattered and intermixed within the prevalent one. B2. Not B1. The less prevalent height class is mostly located apart from the prevalent one, in separate zones or clumps, or is completely	0	
7	Large Snags (Dead	class might even be totally absent. Choose between B1 and B2 and mark the choice with a 1 in the adjoining column: B1. FieldF form - Non-tidal Page 3 of 5

F37	Interspersion of	During most of the part of the growing season when water is present, the spatial pattern of emergent vegetation within the water is mostly:		[AM, FA, FR, INV, NR, OE, PH, PR, SBM, SR, WBF, WBN]
	Emergents & Open			
	Water	Scattered. More than 30% of such vegetation forms small islands or corridors surrounded by water. Intermediate.	0	
		Clumped. More than 70% of such vegetation is in bands along the wetland perimeter or is clumped at one or a few sides of the surface water area.	0	
F38	Persistent Deepwater	If the deepest patch of surface water (flowing or ponded) in or directly adjacent to the AA is mostly deeper than 0.5 m for >2 weeks during the	1	
	Area	growing season, enter "1" and continue. If not, enter "0" and SKIP to F42.(Connection).		
F39	Non-vegetated Aquatic Cover	During most of the growing season and in waters deeper than 0.5 m, the cover for fish, aquatic invertebrates, and/or amphibians that is provided NOT by living vegetation, but by accumulations of dead wood and undercut banks is:		For this question, consider only the wood that is at or above the water surface. Estimates of underwater wood based only on observations from terrestrial viewpoints are unreliable so should not be attempted. [AM, FA, FR, INV]
		Little or none.	0	
		Intermediate. Extensive.	0	
F40	Isolated Island	The AA contains (or is part of) an island or beaver lodge within a lake, pond, or river, and is isolated from the shore by water depths > 1 m on all sides during an average June. The island may be solid, or it may be a floating vegetation mat that is sufficiently large and dense to support a waterbird nest.	0	[WBN]
F41	Floating Algae & Duckweed	At some time of the year, mats of algae and/or duckweed are likely to cover >50% of the AA's otherwise-unshaded water surface, or blanket >50% of the underwater substrate. If true, enter "1" in next column. If untrue or uncertain, enter "0".	0	[EC, PR, WBF]
F42	Channel Connection & Outflow Duration	The most persistent surface water connection (outlet channel or pipe, ditch, or overbank water exchange) between the AA and a downslope stream network is: [Note: If the AA represents only part of a wetland, answer this according to whichever is the least permanent surface connection: the one between the AA and the rest of the wetland, or the surface connection between the wetland and the downslope stream network.] Persistent (surface water flows out for >9 months/year).	1	Consider the connection regardless of whether the surface water is frozen. The "downslope stream network" could consist of ditches, rivers, ponds, or lakes which eventually connect to the ocean. If this cannot be determined white visiting the AAL consult lopographic maps perhaps by viewing these online with Toporama (http://atlas.nrcan.gc.ca/loporama/en/index.html) [CS, FA, FR, NR, OE, PR, Sens, SFS, SR, WCv, WS]
		Seasonal (surface water flows out for 14 days to 9 months/year, not necessarily consecutive).	0	
		Temporary (surface water flows out for <14 days, not necessarily consecutive). None but maps show a stream network downslope from the AA and within a distance that is less than the AA's length. SKIP to F47 (pH	0	
		Measurement).		
		No surface water flows out of the wetland except possibly during extreme events (<once (ph="" 10="" a="" an="" ditch,="" f47="" flows="" into="" lacks="" lake="" measurement).<="" only="" or="" or,="" outlet.="" per="" skip="" td="" that="" to="" water="" wetland,="" years).=""><td>0</td><td></td></once>	0	
F43	Outflow Confinement	During major runoff events, in the places where surface water exits the AA or connected waters nearby, the water:		"Major runoff events" would include biennial high water caused by storms and/or rapid snowmelt. [CS, NR, OE, PR, Sens, SR, STR, WS]
		Mostly passes through a pipe, culvert, narrowly breached dike, berm, beaver dam, or other partial obstruction (other than natural topography) that does not appear to drain the wetland artificially during most of the growing season.	0	mt, ot, Frt, seis, st, str, waj
		Leaves through natural exits (channels or diffuse outflow), not mainly through artificial or temporary features.	1	
		Is exported more quickly than usual due to ditches or pipes within the AA or connected to its outlet, or within 10 m of the AA's edge, which drain the wetland artificially, or water is pumped out of the AA.	0	
F44	Tributary Channel	At least once annually, surface water from a tributary channel that is >100 m long moves into the AA. Or, surface water from a larger permanent water body adjacent to the AA spills into the AA. If it enters only via a pipe, that pipe must be fed by a mapped stream or lake further upslope. If no, SKIP to F47 (pH Measurement).	1	If inlet tributaries cannot be searched for due to inaccessibility of part of the AA, follow suggestions in F42 above. [NRv, PH, PRv, SRv]
F45	Input Water Temperature	Based on lack of shade, water source characteristics, or actual temperature measurements, the inflow is likely to be warmer than surface water in the AA during part of most years. Enter 1= yes, 0= no.	1	[WCv]
	Throughflow	During its travel through the AA at the time of peak annual flow, water arriving in channels: [select only the ONE encountered by most of the		[FA, FR, INV, NR, OE, PR, SR, WS]
	Resistance	incoming water]. Does not bump into many plant stems as it travels through the AA. Nearly all the water continues to travel in unvegetated (often incised) channels that have minimal contact with wetland vegetation, or through a zone of open water such as an instream pond or lake.	0	
		Bumps into herbaceous vegetation but mostly remains in fairly straight channels.	0	
		Bumps into herbaceous vegetation and mostly spreads throughout, or is in widely meandering, multi-branched, or braided channels.	1	
		Bumps into tree trunks and/or shrub stems but mostly remains in fairly straight channels.	0	
		Bumps into tree trunks and/or shrub stems and follows a fairly indirect path from entrance to exit (meandering, multi-branched, or braided).	0	
F47	pH Measurement	The pH in most of the AA's surface water:		Preferably, measure this in larger areas of ponded surface water within the AA, or in streams that have passed through (not along) most of the AA. Unless surface water is completely absent, do not dig holes or make depressions in peat in order to provide water for this measurement. Avoid measuring near roads or in puddles formed only by recent rain. [AM, FA, FR, NR, WBF, PH, PR, Sens, WBF, WBN]
		Was measured, and is: [enter the reading in the column to the right.]		
		Was not measured but surface water is present and is darkly tea-coloured. Or if no surface water, then mosses and plants that indicate peatland (e.g., Labrador tea) are prevalent. Enter "1". Neither of above. Enter "1".	0	
	TDS and/or Conductivity	The TDS (total dissolved solids) or conductivity off the AA's surface water is: (select the first true row with information):		See above for measurement guidance. [FR, INV, NRv, PH, PRv, Sens]
	conductivity	TDS is: [Enter the reading in ppm or mg/L. in the column to the right, if measured, or answer next row.] Conductivity is: [Enter the reading in µS/cm in the column to the right.]		
		Was not measured, but plants that indicate saline conditions cover much of the vegetated AA. Enter "1".	0	
F49	Beaver Probability	Neither of above Use of the AA by beaver during the past 5 years is (select most applicable ONE):	1	[FA, FR, PH, SBM, Sens, WBF, WBN]
	beaver Frobability	Evident from direct observation or presence of gnawed limbs, dams, tracks, dens, lodges, or extensive stands of water-killed trees (snags).	0	
		Likely based on known occurrence in the region and proximity to suitable habitat, which may include: (a) a persistent freshwater wetland, pond, or lake, or a perennial low or mid-gradient (<10%) channel, and (b) a corridor or multiple stands of hardwood trees and shrubs in	1

FieldS form Non-tidal 2

Assessment Area (AA) Results:

Wetland ID: FC-Trib1-W-01

Date: 12 September 2019

Observer: Matt Alexander

Latitude & Longitude (decimal degrees): 45.186357, 66.207911

Scores will appear below after data are entered in worksheets OF, F, and S. See Manual for definitions and descriptions of how scores were computed.

computed.						
Wetland Functions or Other Attributes:	Function Score (Normalised)	Function Rating	Benefits Score (Normalised)	Benefits Rating	Function Score (raw)	Benefits Score (raw)
Water Storage & Delay (WS)	1.28	Lower	0.29	Lower	2.72	0.38
Stream Flow Support (SFS)	6.15	Moderate	5.66	Moderate	3.28	3.30
Water Cooling (WC)	5.45	Higher	6.74	Higher	3.63	4.06
Sediment Retention & Stabilisation (SR)	2.41	Moderate	6.85	Moderate	4.81	4.16
Phosphorus Retention (PR)	3.92	Moderate	5.90	Higher	5.69	5.67
Nitrate Removal & Retention (NR)	1.72	Lower	10.00	Higher	4.89	10.00
Carbon Sequestration (CS)	3.77	Moderate			6.19	
Organic Nutrient Export (OE)	7.65	Higher			6.39	
Anadromous Fish Habitat (FA)	7.01	Higher	5.82	Higher	4.29	4.30
Resident Fish Habitat (FR)	5.87	Moderate	5.92	Higher	3.50	4.20
Aquatic Invertebrate Habitat (INV)	10.00	Higher	7.32	Higher	7.52	5.19
Amphibian & Turtle Habitat (AM)	5.08	Moderate	4.11	Moderate	5.99	4.59
Waterbird Feeding Habitat (WBF)	7.12	Higher	2.50	Moderate	5.67	2.50
Waterbird Nesting Habitat (WBN)	4.22	Moderate	0.00	Lower	3.61	0.00
Songbird, Raptor, & Mammal Habitat (SBM)	9.76	Higher	0.00	Lower	8.09	0.00
Pollinator Habitat (POL)	9.43	Higher	0.00	Lower	7.59	0.00
Native Plant Habitat (PH)	8.05	Higher	6.02	Moderate	6.33	5.23
Public Use & Recognition (PU)			2.00	Lower		1.75
Wetland Sensitivity (Sens)			6.58	Higher		4.17
Wetland Ecological Condition (EC)			6.39	Moderate		7.92
Wetland Stressors (STR) (higher score means more stress)			4.40	Moderate		3.88
Summary Ratings for Grouped Functions:						
HYDROLOGIC Group (WS)	6.15	Higher	0.29	Lower	2.72	0.38
WATER QUALITY SUPPORT Group (max+avg/2 of SR, PR, NR, CS)	3.30	Moderate	8.79	Higher	5.79	8.30
AQUATIC SUPPORT Group (max+avg/2 of SFS, INV, OE, WC)	8.66	Higher	6.95	Higher	6.36	4.69
AQUATIC HABITAT Group (max+avg/2 of FA, FR, AM, WBF, WBN)	6.49	Higher	4.80	Moderate	5.30	3.85
TRANSITION HABITAT Group (max+avg/2 of SBM, PH, POL)	9.42	Higher	4.02	Moderate	7.72	3.49
WETLAND CONDITION (EC)			6.39	Moderate		7.92
WETLAND RISK (average of Sensitivity & Stressors)			5.49	Higher		4.03
	NOTE: A coor	e of 0 does not	moon the fune	tion or bonofit i	a abaant from t	as wotland It

NOTE: A score of 0 does not mean the function or benefit is absent from the wetland. It means only that this wetland has a capacity that is equal or less than the lowest-scoring one, for that function or benefit, from among the 98 NB calibration wetlands that were assessed previously.

Cover Page: Basic Description of Assessment	WESP-AC version 2
Site Name:	Burchill Wind Energy Project - FC-Trib1-W-02
Investigator Name:	Derrick Mitchell
Date of Field Assessment:	14 October 2019
Nearest Town:	Lorneville (west Saint John), New Brunswick
Latitude (decimal degrees):	45.185552
Longitude (decimal degrees):	-66.204419
Is a map based on a formal on-site wetland delineation available?	Yes
Approximate size of the Assessment Area (AA, in hectares):	5.1
AA as percent of entire wetland (approx.). Attach sketch map if AA is smaller than the entire contiguous wetland.	80
What percent (approx.) of the wetland were you able to visit?	80
What percent (approx.) of the AA were you able to visit?	100
Were you able to ask the site owner/manager about any of the questions?	No
Indicate here if you intentionally surveyed for rare plants, calciphile plants, or rare animals	Yes
Have you attended a WESP-AC training session? If so, indicate approximate month & year	Yes, September 2016
How many wetlands have you assessed previously using WESP-AC? (approx.)	100+
Comments about the site or this WESP-AC assessment (attach extra page if desired):	

Form OF (Office). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Conduct an assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answering many of the questions below will equire using these online map viewers:

Google Earth Pro: https://www.google.com/earth/download/gep/agree.html

GeoNB: http://www.snb.ca/geonb1/ and http://www.snb.ca/geonb1/e/apps/apps-E.asp

Geons: http://www.snb.ca/geonol/ and http://www.snb.ca/geonol/e/apps/apps/apps-e.asp
For most wetlands, completing this office data form will require 1-2 hours. For a list of functions to which each question pertains, see bracketed abbreviations in the Definitions/Explanations column. For detailed descriptions of each
WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus
Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding
Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity, STR= Stressors.

#	Indicators	Condition Choices	Data	Definitions/Explanations
OF1	Province	Mark the province in which the AA is located by changing the 0 in the column next to it to a "1". Mark only one.		This determines to which province's calibration wetlands the raw score of any wetland is normalised. In the function and benefits models, it also triggers the automatic exclusion of indicators for which no
		New Brunswick	1	spatial data exists in a particular province.
		Nova Scotia	0	
		Prince Edward Island	0	
		Newfoundland-Labrador (2)	0	
DF2	Ponded Area Within 1 km.	The area of surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) within 1 km is:		"Adjacent" means not separated from the AA by a wide expanse (>50 m) of upland (including roads >50 m wide). Include ponded areas likely to be hidden by wetland vegetation. If surface water
		<0.01 hectare (about 10 m x 10 m).	1	extends beyond 1 km, include only the part within 1 km. Do not include tidal areas. Measure the ar from aerial imagery using Google Earth Pro (click on Ruler icon in toolbar, then Polygon in pop-up
		0.01 - 0.1 hectare.	0	menu). With the GeoNB viewer, enable the Wetlands layer, then measure with the Draw & Measure
		0.1 - 1 hectare.	0	tool after specifying Aerial as the Basemap. However, do not rely entirely on wetland boundaries
		1 to 10 hectares.	0	shown in online wetlands layers. [PH, SBM, WBN]
		10 to 100 hectares.	0	
DF3	Ponded Water &	>100 hectares. The area of wetlands and surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) within		See definition of adjacent in OF2. If the AA's wetland vegetation extends beyond 1 km, include only
ЛЗ	Wetland Within 1 km.	1 km is:		the part within 1 km. "Ponded" means not flowing in rivers or streams. [Sens, WBF]
		<0.01 hectare (about 10 m x 10 m).	0	
		0.01 - 0.1 hectare.	0	
		0.1 - 1 hectare.	0	4
		1 to 10 hectares.	0	4
		10 to 100 hectares. >100 hectares.	0	
)F4	Size of Largest Nearby	The largest vegetated patch or corridor that includes the AA's vegetation plus aladjacent upland vegetation that is not lawn, row crops,		See definition of adjacent in OF2. Use Google Earth Pro's polygon ruler (as described above).
J1 7	Vegetated Tract or Corridor	heavily grazed lands, conifer plantation is:		Exclude conifer plantations only if it is obvious that trees were planted in rows. [AM, PH, SBM, Sens]
	Comuci	<0.01 hectare (about 10 m x 10 m).	0	
		0.01 - 0.1 hectare.	0	
		0.1 - 1 hectare.	0	4
		1 to 10 hectares. 10 to 100 hectares.	0	4
		10 to 100 hectares. 100 to 1000 hectares.	1	
		>1000 hectares. [This is nearly always the answer in relatively undeveloped landscapes]	0	
DF5	Distance to Large	The minimum distance from the edge of the AA to the edge of the closest vegetated land (but excluding row crops, lawn, conifer	0	To measure distance, use Google Earth Pro (Ruler > Line tool). Or use Draw & Measure tool at
	Vegetated Tract	plantation) larger than 375 hectares (about 2 km on a side), is: <50 m, and not separated from the 375-ha vegetated area by any width ofpaved roads, stretches of open water, row crops, bare ground,	1	GeoNB. The 375-ha criterion is from the Fundy Model Forest Project. [AM, PH, POL, SBM, Sens]
		awn, or impervious surface. Or the AA itself contains >375 ha of vegetation. [This is often the answer in relatively undeveloped landscaps <50 m, but completely separated from the 375-ha vegetated area by those features, and AA does not contain >375 ha of vegetation.	0	
		50-500 m, and not separated.	0	
		50-500 m, but separated by those features.	0	
		0.5 - 5 km, and not separated.	0	
		0.5 - 5 km, but separated by those features.	0	-
DF6	Herbaceous Uniqueness	None of the above (the closest patches or corridors which are that large are >5 km away). The AA's vegetation cover is >10% herbaceous* but uplands within 5 km have <10% herbaceous cover. If so, enter *3* and continue to	0	For this question only, consider moss to be herbaceous vegetation. Determine the score by viewing
510	Herioaceous Offiqueness	The ArX segetation cover is >10% herbaceous* but uplands within 1 km have <10% herbaceous cover. If so enter "2" and continue to OF7. If not, consider: The ARX segetation cover is >10% herbaceous* but uplands within 10 m of the wetland edge have <10% herbaceous cover. If so, enter "1". "NOTE: Exclude lawns, row crops, heavily grazed lands, forest, shrublands. Include moss as well as grasslike plants in this use of "herbaceous wegetation".		aerial imagery in Google Earth after successively drawing or estimating the boundaries of the buffers of 5 km, 1 km, and 100 m radius focused on the center of the AA. Circles of specified radius can be drawn in Google Earth Pro by clicking on the Ruler icon, then Circle in the pop-up menu. [AMv, PHv POLv, SBMv, WBFv, WBNv]
OF7	Woody Uniqueness	The AA's vegetation cover is >10% woody' but uptands within 5 km have <10% woody cover. If so, enter "3" and continue to OF8. If not, consider: The AA's vegetation is >10% woody' but uptands within 1 km have <10% woody cover. If so enter "2" and continue to OF8. If not, consider: The AA's vegetation is >10% woody' but uptands within 100 m of the wetland edge have <10% woody cover. If so, enter "1"	0	See above. Do not consider conifer plantations to be forest if it is obvious that trees were planted in rows. [AMv, PHv, POLv, SBMv]
		[* NOTE: woody cover = trees & shrubs taller than 1 m.]		
DF8	Local Vegetated Cover Percentage	Draw a 5-km radius circle measured from the center of the AA. Ignoring all permanent water in the circle, the percent of the remaining an that is wooded or unmanaged herbaceous vegetation (NOT lawn, row crops, bare or heavily grazed land, clearcuts, or conifer plantations is:		In Google Earth, draw the 5 km buffer and then estimate land cover percentages, or do GIS analysis of an appropriate land cover layer. [AM, PH, POL, SBM, Sens]
		<5% of the land.	0	-
		5 to 20% of the land. 20 to 60% of the land.	0	-
		20 to 60% of the land.	0	1
		>90% of the land. SKIP to OF10.	1	1
DF9	Type of Land Cover	Within the 5-km radius circle, and ignoring all permanent water, the land area that is bare or non-perennial cover is mostly:		[AM, SBM]
	Alteration			
		Impervious surface, e.g., paved road, parking lot, building, exposed rock.	0	-
	Distance by D. 11	Bare pervious surface, e.g., lawn, recent (<5 yrs ago) clearcut, dirt or gravel road, cropland, landslide, conifer plantation.	0	
	Distance by Road to Nearest Population	Measured along the maintained road nearest the AA, the distance to the nearestpopulation center is:		"Population center" means a settled area with more than about 5 regularly- inhabited structures per square kilometer. In Google Earth, click on the Ruler icon, then Path, and draw and measure the
OF10		<100 m.	0	route. Or use the GeoNB's Draw & Measure tool> Freehand Line to draw and measure the route to
OF10	Center			
OF10	Center	100 - 500 m.	1	Settlements (click on Place Names in menu) or other areas not close to mapped settlements but
OF10	Center	0.5- 1 km.	0	Settlements (click on Place Names in menu) or other areas not close to mapped settlements but which meet the criteria.[FAv, FRv, NRv, PH, PU, SBM, WBFv]
OF10	Center		0 0	

OF11	Distance to Nearest	From the center of the AA, the distance to the nearest maintained public road (dirt or paved) is:		Determine this by viewing aerial imagery in Google Earth and measuring with the Ruler>Line tool. Or
	Maintained Road	<10 m.	0	use the GeoNB's Draw Line tool. [AM, FAv, FRv, NRv, PH, PU, SBM, STR, WBN]
		10 - 25 m.	0	
		25 - 50 m.	0	
		50 - 100 m. 100 - 500 m.	0	
		>500 m.	0	
OF12	Wildlife Access	Draw a circle of radius of 5 km from the center of the AA. If mammals and amphibians can move from the center of the AA to ALL other separate wetlands and ponds located within the circle without being forced to cross pavement (any width), lawns, bare ground, and/or marine waters, mark 1= yes can move to all, 0= no. Change toblank if there are no other wetlands within 5 km.	0	In NB, enable the Wetlands layer in GeoNB (despite its omissions) to show surrounding wetlands and roads, while estimating the location of the 5 km circle (or draw the 5 km circle in Google Earth Pro using the Circle tool and compare). Evaluate using Google Earth, being cautious to search for roads
0513	Distance to Dooded	The distance from the AA analysis the planet (but any only a party of the first Complete the complete transfer to		hidden under forest canopy. [AM, SBM, STR]
OF13	Distance to Ponded Water	The distance from the AA center to the closest (but separate) ponded water body visible in GoogleEarth imagery is:		In Google Earth, zoom in closely to examine the surrounding landscape for ponds, lakes, and wetlands that appear to be permanently flooded. Enable the GeoNB viewer's Wetlands layer as well
		<50 m, and not separated by any width of paved roads, stretches of open water, row crops, lawn, bare ground, or impervious surface.	0	[AM, PH, SBM, Sens, WBF, WBN]
		<50 m, but completely separated by those features.	0	
		50-500 m, and not separated. 50-500 m, but separated by those features.	0	
		0.5 - 1 km, and not separated by those readiles.	0	
		0.5 - 1 km, but separated by those features.	0	
		None of the above (the closest patches or corridors that large are >1 km away).	0	
OF14	Distance to Large Ponded Water	The distance from the AA center to the closest (but separate)non-tidal body of water that is ponded during most of the year and islarger than 8 hectares during most of a normal year is:		Determine this by viewing aerial imagery in Google Earth. [Sens, WBF, WBN]
		<100 m.	0	
		100 m - 1 km.	0	
		1 -2 km. 2-5 km.	1	
		2-5 KM. 5-10 km.	0	
		>10 km.	0	1
OF15	Tidal Proximity	The distance from the AA edge to the closesttidal water body (regardless of its salinity) is:		In Google Earth, measure the distance to the ocean (including Bay of Fundy) or tidal river, whichever
		<100 m.	0	is closer. If you need to see how far upriver a river is tidal, see the KMZ file provided with this calculator for NB (NB Headtide). Points shown in those files are only an approximation, so local
		100 m - 1 km.	0	information if available may be preferable. [FA, WBF]
		1 - 5 km.	1	
		5-10 km.	0	
		10-40 km.	0	
OF16	Upland Edge Contact	Select one:	U	[NR, SBM, Sens]
		The AA has no upland edge (or upland is <1% of perimeter). The AA is entirely surrounded by (& contiguous with) other wetlands or water.	0	,
		1-25% of the AA's perimeter abuts upland (including filled areas). The rest adjoins other wetlands or water that is mostly wider than the AA	0	
		25-50% of the AA's perimeter abuts upland. The rest adjoins other wetlands or water that is mostly wider than the AA.	0	
		50-75% of the AA's perimeter abuts upland. The rest adjoins other wetlands or water that is mostly wider than the AA.	1	
		More than 75% of the AA's perimeter abuts upland. Any remainder adjoins other wetlands or water that is mostly wider than the AA.This	0	
0517	Fland Danner from Nam	will be true for most assessments done with WESP-AC.		In the Control of the
OF17	Flood Damage from Non- tidal Waters			In the GeoNB map viewer: click on "More" in upper right, then "Flood Information". Expand the menu under it by clicking on the arrow to its left and the slider to its right. Uncheck the first (Limits of Data)
		Maps show Flood Zone or Flood Risk areas and there appears to be infrastructure vulnerable to river flooding not caused by tidal storm surges.	0	box. Where available, LiDAR imagery can provide finer elevational resolution useful for flood modeling. [WSv]
		Maps show Flood Zone or Flood Risk areas, but infrastructure is absent or is not vulnerable to floods from a non-tidal river. In some cases levees, upriver dams, or other measures may partly limit damage or risk from smaller events.	0	
		Maps do not show Flood Zone or Flood Risk areas (or no such mapping has been done locally) and there appears to be infrastructure	0	
		vulnerable to river flooding unrelated to tidal storm surges.		
		Maps do not show Flood Zone or Flood Risk areas (or no such mapping has been done locally) and there is no infrastructure vulnerable to river flooding unrelated to tidal storm surges.	1	
OF18	Relative Elevation in Watershed	In Google Earth, enable the Terrain layer (lower left menu) and open the NB_Watersheds KMZ file that accompanies this calculator. Then determine the AA's approximate elevation (bottom right, NOT the "eye att"). Then move cursor around to determine the watershed's maximum and minimum elevation. Divide the AA's elevation by the (max-min).	0.18	[FA, NR, Sens, SFSv, WCv, WSv]
OF19	Water Quality Sensitive Watershed or Area	In Google Earth, open the KMZ file NB_Watershed Protected Area which accompanies this calculator. The AA is within such an area. Enter 1 = yes, 0 = no.	0	If an ACCDC report is available for this AA, it also may contain such information. [NRv]
OF20	Degraded Water	Sampling indicates a problem with concentrations of metals, hydrocarbons, nutrients, or other substances (excluding bacteria, acidic		May use existing data, or sample those waters as part of this wetland assessment. "Harmful" should
	Upstream	water, high temperatures) being present at levels harmful to aquatic life or humans, and:		be evaluated with regard to current federal or provincial water quality standards. [AM, FA, FR, NRv,
		The condition is present within the AA.	0	PRv, SRv, STR, WBF, WBN]
		The condition is present in waters within 1 km that flowinto the AA, but has not been documented in the AA itself.	0	
		Sampling during both low water periods and times with high runoff (storms, snowmelt) indicates no problems in either the AA or inflowing waters.	0	
		Data are insufficient (no or inadequate sampling within 1 km, or condition exists only at >1 km upstream)This is the situation for nearly all wetlands in this region.	1	
OF21	Degraded Water	The problem described above is downslope from the AA, and:		May use existing data, or monitor waters as part of this wetland assessment. [NRv, PRv, SRv]
	Downstream	The condition is present within 1 km downslope and connected to the AA by a channel.	0	
		The condition is present within 5 km downslope and connected to the AA by a channel, or within 1 km but not connected to the AA by a	0	
		channel.	0	
		Sampling during both low water periods and times with high runoff (storms, snowmelt) indicates no problems in either the AA or inflowing waters.	0	
		Data are insufficient (no or inadequate sampling within 1 km, or condition exists only at >1 km upstream)This is the situation for nearly all wetlands in this region.	1	
OF22	Wetland as a % of Its	From a topographic map and field observations, estimate the approximate boundaries of the catchment (CA) of the entire wetland of which		Topographic maps may be viewed online at the National Atlas of Canada (Toporama):
	Contributing Area (Catchment)	the AA may be only a part. Then adjust those boundaries if necessary based on your field observations of the surrounding terrain, and/or busing procedures described in the Manual. Divide the area of the wetland (not just the AA) by the approximate area of its catchment excluding the area of the wetland itself. When doing the calculation, if ponded water is adjacent to the wetland, include that in the wetland area. The result is:		http://atlas.gc.ca/loporama/en/index.html [NR, PR, Sens, SR, WS]
		<0.01, or calchment size unknown due to stormwater pipes that collect water from an indeterminate area.	0	
		0.01 to 0.1.	0	
		0.1 to 1. >1 (wetland is larger than its catchment (e.g., wetland with flat surrounding terrain and no inlet, or is entirely isolated by dikes, or is a raisec	0	
OE33	Unwagatated Curface in	bog).	U	ICA INN/ MDv DDv SDv STD MCv MSvil
UF23	Unvegetated Surface in the Contributing Area	The proportion of the AA's contributing area (measured to no more than 1000 m upstope) that is comprised of buildings, roads, parking lots other pevement, exposed bedrock, landslides, and other mostly-bare surface is about:		[FA, INV, NRv, PRv, SRv, STR, WCv, WSv]
		<10%. 10 to 25%.	0	
		10 10 2070.	v	İ
		>25%.	0	

OF24				
	Transport From Upslope	A relatively large proportion of the precipitation that falls farther upslope in the CA reaches this wetland quickly as runoff (surface water), as		[NRv, PRv, SRv, WSv]
		indicated by the following:		
		(a) input channel is present, (b) input channels have been straightened.		
		(c) upslope wetlands have been ditched extensively,		
		(d) land cover is mostly non-forest,		
		(e) CA slopes are steep, and/or		
		(f) most CA soils are shallow (bedrock near surface) and/or have high runoff coefficients.		
		This statement is:		
		Mostly true.	0	
		Somewhat true.	0	1
		Mostly untrue.	- 1	
OF25	Aspect	The overland flow direction of most surface water (in streams, rivers, or runoff) that enters the AA is:		[AM, NR, SFS, WC, WS]
				• • • • • •
		Northward (N, NE). north-facing contributing area.	0	
		Southward (S, SW). south-facing contributing area.	0	
		Other (E, SE, W, NW), or no detectable uphill slope or input channel (flat).	- 1	
	Internal Flow Distance	The horizontal flow distance from the wetland's inlet to outlet is:		Identify inlets and outlets, if any, from topographic maps (use elevations to determine which are inle
	(Path Length)	<10 m.	0	and which are outlets) and augment by field inspection. [NR, OE, PR, SR, WS]
		10 - 50 m.		
			0	
		50 - 100 m.	0	
		100 - 1000 m.	1	
		1- 2 km.	0	
		>2 km, or wetland lacks an inlet and outlet.	0	
OF27	Growing Degree Days	In Google Earth, open the KMZ file that accompanies this calculator, called NB-PEL_GrowingDegreeDays. Place your cursor over the AA and left-click. From the pop-up, enter the GRIDCODE in the next column.	2428	This layer was provided by Dr. Dan McKenney of the Canadian Forest Service [AM, CS, FR, INV, NR, OE, PH, PR, Sens, SR, WBF, WCv, WS]
OF28	Fish Access or Use	According to agency biologists and/or your own observations, the AA. [Nark just the first choice that is true.].		Regarding the last choice, if uncertain if an AA is fishless, consider the possibility its waters have be stocked. In NB, the list of stocked waters is at:
		Is known to support rearing and/or spawning by Atlantic salmon or other anadromous species or eels. In NB, consult Figure A-2 in	0	http://www2.gnb.ca/content/gnb/en/departments/erd/natural_resources/content/fish/content/Stocked
		Appendix A of the Manual. Contact local fishery biologists, review the ACCDC report, and visit these websites:		aters.html
		http://www.salmonatlas.com/atlanticsalmon/canada-east/index.1.html http://atlanticsalmonfederation.org/rivers/introduction.html		[AM, FA, FR, INV, WBF, WBN]
		Has not been documented to support Atlantic salmon rearing and/or spawning, but is connected to nearby waters likely to contain Atlantic	0	
		salmon or other anadromous species or eels and is probably accessed by those during some conditions.		
		Is probably is not accessed by any anadromous fish species but is known or likely to havether fish at least seasonally.	0	
		Is known or likely to be fishless (e.g., too small, dry, and/or not accessible even temporarily, and not stocked).	- 1	
OF29	Species of Conservation	Within the past 10 years, in the AA (or in its adjoining waters or wetland), qualified observers have documented mark all applicable:		Request information from ACCDC and/or conduct your own survey at an appropriate season using a
	Concern			approved protocol. For birds, also check eBird.org. [AMv, EC, PHv, POLv, SBMv, Sens, WBFv,

---	-----------------------	--------------------------------	---------------	------------	-------

Form F (Field). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Walk for no less than 10 minutes from the wetland edge towards its core, in the part of the AA that is proposed for alteration. If no alteration is proposed, walk in a portion that appears to be most representative of the wetland overall. Walk only where it is safe and legal to do so. Conduct the assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answer these questions primarily based on your onsite observations and interpretations. Do not write in shaded parts of this data form. Answering some questions accurately may require conferring with the landowner or other knowledgable persons and/or reviewing aerial imagery. For most wetlands, completing this field data form will require 1-2 hours on a site. For a list of functions to which each question pertains, see the accompanying Interpretations form. For detailed descriptions of each WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage & Delay, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity, STR= Stressors.

				200 5
#	Indicators	Condition Choices	Data	Definitions/Explanations
1	Wetland Type	Follow the key below and mark the ONE row that best describes MOST of the vegetated part of the AA:		Ericaceous shrubs are ones in the heather family (Ericaceae). Most have leathery evergreen leaves. They include rhododendron, azalea, swamp laurel, leatherleaf, Labrador tea, and others. Most require
		A. Moss and/or lichen cover more than 25% of the ground. Often dominated by ericaceous shrubs (e.g., Labrador tea) or other acid-tolerant plants (e.g., bog cranberry, pitcher plant, sundew, orchids). Substrate is mostly undecomposed peat. Choose between A1 and A2 and mark the choice with a 1 in their adjoining column. Otherwise go to B below.		acidic soil. Although not in the family Ericaceae, sweetgale (<i>Myrica gale</i>) should be counted also. [AM, CS, FA, FR, INV, NR, OE, PH, Sens, SFS, WBF, WBN]
		A1. Surface water is usually absent or, if present, pH is typically <4.5 and conductivity is usually <100 µS/cm (<64 ppm TDS). Trees are absent or nearly so. Sedge cover usually sparse or absent but cottongrass and/or lichen cover may be extensive, as well as cloudberry, lingonberry, sheep laurel, and a sedge (Carex rariflora). Welfand surface and surrounding landscape are seldom sloping and welfand often is domed (convex). Inlet and outlet channels are usually absent. If known, pH of peat is <4.0.	1	
		A2. Not A1. Surface water, if present, has pH typically >4.5 and conductivity is usually >100 µS/cm (>64 ppm TDS). Sedge cover is usually extensive, and/or tree and fall shrub cover is extensive. Sometimes at toe of slope or edge of water body. An exit channel is usually present. Wetter than A1 and peat depth may be shallower (<2 m).	0	
		B. Moss and/or lichen cover less than 25% of the ground. Soil is mineral or decomposed organic (muck). Choose between B1 and B2 and mark the choice with a 1 in their adjoining column:		
		B1. Trees and shrubs taller than 1 m comprise more than 25% of the vegetated cover. Surface water is mostly absent or inundates the vegetation only seasonally (e.g., vernal pools or floodplain).	0	
		B2. Not B1. Tree & tall shrubs comprise less than than 25% of the vegetated cover. Vegetation is mostly herbaceous, e.g., cattail, bulrush, burreed, pond lily, horsetail. Surface water may be extensive and fluctuates seasonally, being either persistent or drying up partly or entirely.	0	
		the AA should include all persistent waters in ponds smaller than 8 hectares (-283 m on a side) that are adjacent to the AA. The		
nclud ' adja descri	e the open water part ad cent " is used synonymo bed features along their	the water area of adjacent ponded water larger than 8 ha and adjacent rivers wider than 20 m. Specifically, the AA should jacent to wetland vegetation and equal in width to the average width of that vegetated zone. Throughout this data form, usly with abutting, adjoining, bordering, contiguous and means no upland (manmade or natural) completely separates the directly shared edge. Features joined only by a channel are not necessarily considered to be adjacent a large portion of their res do not have to be hydrologically connected in order to be considered adjacent.		
2	Wetland Types - Adjoining or Subordinate	If the AA is smaller than 1 ha, mark all other types that occupy more than 1% of the vegetated AA. If the AA is larger than 1 ha, mark all other types which are within or adjacent to the AA and occupy more than 1 ha, as visible from the AA or as interpreted from aerial imagery. Do not mark again the type marked in F1.		1 hectare is 10,000 sq. m or about 2.5 acres. It could have dimensions of 100 m by 100 m, 1000 m by 10 m, or similar. [AM, INV, SBM, WBF]
		A1.	0	
		A2. B1.	0	
		B2.	0	
3	Woody Height & Form Diversity	Following EACH row below, indicate with a number code the percentage of the living vegetation in the AA which is occupied by that feature (6 if >95%, 5 if 75-95%, 4 if 50-75%, 3 if 25-50%, 2 if 5-25%, 1 if <5%, 0 if none). If the vegetated part of the AA is largely herbaceous (non-woody) vegetation, these percentages should not sum to 100%.		Deciduous shrubs in this region usually include buttonbush, Labrador lea, bayberry (Morella), huckleberry, cranberry, cloudberry, sweetgale, alder, willow, birch, ash, dogwood, and a few others. If you assigned a code of 3 or higher to any of the first four choices and the ground cover beneath the trees/shrubs is ~25% moss, then question F1 might be "B1". [CS, INV, NR, PH, POL, SBM, Sens]
		coniferous trees (may include tamarack) taller than 3 m. deciduous trees taller than 3 m.	5	ueesisiitubs is <23% iiloss, iileit quesiioit i Tilligiit be -b1 . [63, iivv, iiv, F1, F0L, 3bw, 3eiis]
		coniferous or ericaceous shrubs or trees 1-3 m tall not directly below the canopy of trees.	2	
		deciduous shrubs or trees 1-3 m tall not directly below the canopy of trees.	2	
		coniferous or ericaceous shrubs <1 m tall not directly below the canopy of taller vegetation. deciduous shrubs or trees <1 m tall (e.g., deciduous seedlings) not directly below the canopy of taller vegetation.	1	
Vote :	If none of top 4 rows in	F3 was marked 2 or greater, SKIP to F9 (N fixers).		
4	Dominance of Most	Determine which two woody plant species comprise the greatest portion of the low (<3 m) woody cover . Then choose one:		[PH, POL, SBM, Sens]
	Abundant Shrub Species	those species together comprise > 50% of such cover.	0	
-	· ·	those species together do not comprise > 50% of such cover. Mark ALL the types that comprise >5% of the woody canopy cover in the AA or >5% of the wooded areas (if any) along its upland edge	1	
.0	Woody Diameter Classes	Main ALL the types that comprise >>% or the woody carropy cover in the AA or >>% or the wooded areas (it arry) along its uprand edge (perfineter). The edge should include only the frees whose canopies extend into the AA. conferous, 1-9 cm diameter and >1 m fall.	1	Estimate the diameters at chest height. If small-diameter trees are overtopped (shaded) by larger ones, visualise a "subcanopy" at the average height of the smaller-dbh trees, to serve as a basis for th minimum 5% canopy requirement in this question. The trees and shrubs need not be weltland species
		broad-leaved deciduous 1-9 cm diameter and >1 m tall.	1	[AM, CS, POL, SBM, Sens, WBN]
		coniferous, 10-19 cm diameter.	1	
		broad-leaved deciduous 10-19 cm diameter. coniferous, 20-40 cm diameter.	1	
		broad-leaved deciduous 20-40 cm diameter.	1	
		coniferous, >40 cm diameter.	0	
		hand hand desidence 40 and desidence		
6	Height Class	broad-leaved deciduous >40 cm diameter. Follow the key below and mark the ONE row that best describes MOST of the AA:	0	[AM. INV. NR. PH. SBM. Sens]
6	Height Class Interspersion	broad-leaved deciduous >40 cm diameter. Follow the key below and mark the ONE row that best describes MOST of the AA: A. Neither the vegetation taller than 1 m nor the vegetation shorter than that comprise >70% of the vegetated part of the AA. They each comprise 30-70%. Choose between A1 and A2 and mark the choice with a 1 in the adjoining column. Otherwise go to B below.		[AM, INV, NR, PH, SBM, Sens]

FieldF form - Non-tidal Page 3 of 5

F37	Interspersion of	During most of the part of the growing season when water is present, the spatial pattern of emergent vegetation within the water is mostly:		[AM, FA, FR, INV, NR, OE, PH, PR, SBM, SR, WBF, WBN]
	Emergents & Open Water	Scattered. More than 30% of such vegetation forms small islands or corridors surrounded by water.	0	
	water	Intermediate.	0	
		Clumped. More than 70% of such vegetation is in bands along the wetland perimeter or is clumped at one or a few sides of the surface water area.	0	
F38	Persistent Deepwater	If the deepest patch of surface water (flowing or ponded) in or directly adjacent to the AA is mostly deeper than 0.5 m for >2 weeks during the	0	
F39	Area Non-vegetated Aquatic	growing season, enter "1" and continue. If not, enter "0" and SKIP to F42.(Connection). During most of the growing season and in waters deeper than 0.5 m, the cover for fish, aquatic invertebrates, and/or amphibians that is		For this question, consider only the wood that is at or above the water surface. Estimates of underwater
137	Cover Cover	provided NOT by living vegetation, but by accumulations of dead wood and undercut banks is:		wood based only on observations from terrestrial viewpoints are unreliable so should not be attempted.
		Little or none. Intermediate.	0	[AM, FA, FR, INV]
		Extensive.	0	
F40	Isolated Island	The AA contains (or is part of) an island or beaver lodge within a lake, pond, or river, and is isolated from the shore by water depths > 1 m on all sides during an average June. The island may be solid, or it may be a floating vegetation mat that is sufficiently large and dense to support a waterbird nest.	0	[WBN]
	Floating Algae & Duckweed	Al some time of the year, mats of algae and/or duckweed are likely to cover >50% of the AA's otherwise-unshaded water surface, or blankel >50% of the underwater substrate. If true, enter "1" in next column. If untrue or uncertain, enter "0".	0	[EC, PR, WBF]
F42	Channel Connection & Outflow Duration	The most persistent surface water connection (outlet channel or pipe, ditch, or overbank water exchange) between the AA and a downslope stream network is: [Note: If the AA represents only part of a welland, answer this according to whichever is the least permanent surface connection: the one between the AA and the rest of the wetland, or the surface connection between the wetland and the downslope stream network.] Persistent (surface water flows out for >9 months/year).	0	Consider the connection regardless of whether the surface water is frozen. The "downslope stream network" could consist of ditches, rivers, ponds, or lakes which eventually connect to the ocean. If this cannot be determined while visiting the AA, consult topographic maps perhaps by viewing these online with Toporama (http://atlas.nrcan.gc.ca/toporama/en/index.html) [CS, FA, FR, NR, OE, PR, Sens, SFS SR, WCV, WS]
		Seasonal (surface water flows out for 14 days to 9 months/year, not necessarily consecutive).	1	
		Temporary (surface water flows out for <14 days, not necessarily consecutive). None but maps show a stream network downslope from the AA and within a distance that is less than the AA's length. SKIP to F47 (pH	0	
		Measurement).		
		No surface water flows out of the wetland except possibly during extreme events (-once per 10 years). Or, water flows only into a wetland, ditch, or lake that lacks an outlet. SKIP to F47 (pH Measurement).	0	
F43	Outflow Confinement	During major runoff events, in the places where surface water exits the AA or connected waters nearby, the water:		"Major runoff events" would include biennial high water caused by storms and/or rapid snowmelt. [CS, NR, OE, PR, Sens, SR, STR, WS]
		Mostly passes through a pipe, culvert, narrowly breached dike, berm, beaver dam, or other partial obstruction (other than natural topography) that does not appear to drain the wetland artificially during most of the growing season.	0	
		Leaves through natural exits (channels or diffuse outflow), not mainly through artificial or temporary features.	1	
		Is exported more quickly than usual due to ditches or pipes within the AA or connected to its outlet, or within 10 m of the AA's edge, which drain the wetland artificially, or water is pumped out of the AA.	0	
F44	Tributary Channel	At least once annually, surface water from a tributary channel that is >100 m long moves into the AA. Or, surface water from a larger permanent water body adjacent to the AA spills into the AA. If it enters only via a pipe, that pipe must be fed by a mapped stream or lake further upslope. If no, SKIP to F47 (pH Measurement).	0	If inlet tributaries cannot be searched for due to inaccessibility of part of the AA, follow suggestions in F42 above. [NRv, PH, PRv, SRv]
F45	Input Water Temperature	Based on lack of shade, water source characteristics, or actual temperature measurements, the inflow is likely to be warmer than surface water in the AA during part of most years. Enter 1= yes, 0= no.	0	[WCv]
F46	Throughflow	During its travel through the AA at the time of peak annual flow, water arriving in channels: [select only the ONE encountered by most of the incoming water].		[FA, FR, INV, NR, OE, PR, SR, WS]
	Resistance	Does not bump into many plant stems as it travels through the AA. Nearly all the water continues to travel in unvegetated (often incised)	0	
		channels that have minimal contact with wetland vegetation, or through a zone of open water such as an instream pond or lake.		
		Bumps into herbaceous vegetation but mostly remains in fairly straight channels.	0	
		Bumps into herbaceous vegetation and mostly spreads throughout, or is in widely meandering, multi-branched, or braided channels.	0	
		Bumps into tree trunks and/or shrub stems but mostly remains in fairly straight channels. Bumps into tree trunks and/or shrub stems and follows a fairly indirect path from entrance to exit (meandering, multi-branched, or braided).	0	
F47	pH Measurement	The pH in most of the AA's surface water:		Preferably, measure this in larger areas of ponded surface water within the AA, or in streams that have passed through (not along) most of the AA. Unless surface water is completely absent, do not dig holes
		Was measured, and is: [enter the reading in the column to the right.] Was not measured but surface water is present and is darkly tea-coloured. Or if no surface water, then mosses and plants that indicate	0	or make depressions in peat in order to provide water for this measurement. Avoid measuring near
		peatland (e.g., Labrador tea) are prevalent. Enter "1".	0	roads or in puddles formed only by recent rain. [AM, FA, FR, NR, WBF, PH, PR, Sens, WBF, WBN]
F48	TDS and/or	Neither of above. Enter "1". The TDS (total dissolved solids) or conductivity off the AA's surface water is: (select the first true row with information):	1	See above for measurement guidance. [FR, INV, NRv, PH, PRv, Sens]
	Conductivity	TDS is: [Enter the reading in ppm or mg/L in the column to the right, if measured, or answer next row.]		
		Conductivity is [Enter the reading in µS/cm in the column to the right.] Was not measured, but plants that indicate saline conditions cover much of the vegetated AA. Enter "1".	0	
		Neither of above	1	
F49	Beaver Probability	Use of the AA by beaver during the past 5 years is (select most applicable ONE):		[FA, FR, PH, SBM, Sens, WBF, WBN]
		Evident from direct observation or presence of gnawed limbs, dams, tracks, dens, lodges, or extensive stands of water-killed trees (snags).	0	
		Likely based on known occurrence in the region and proximity to suitable habitat, which may include: (a) a persistent freshwater wetland, pond, or lake, or a perennial low or mid-gradient (<10%) channel, and (b) a corridor or multiple stands of hardwood trees and shrubs in vegetated areas near surface water.	0	
F50	Groundwater Strength	Unlikely because site characteristics above are deficient, and/or this is a settled area or other area where beaver are routinely removed. Select first applicable choice:	1	Adhere to these criteria strictly do not use personal judgment based on fen conditions, pH, or other
1 30	of Evidence	Select first applicable choice: Springs are known to be present within the AA, or if groundwater levels have been monitored, that has demonstrated that groundwater primarily discharges to the wetland for longer periods during the year than periods when the wetland recharges the groundwater.	0	Agnere to these criteria strictly - oo hot use personal judgment assed on ren conditions, pH, or other evidence. Consult lopographic maps to detect breaks in slope described here. Rust deposits associated with groundwater seeps may be most noticeable as orange discoloration in ice formations along streams during early winter. [AM, CS, FA, FR, INV, NR, OE, PH, PRv, SFS, WC, WS]
		Most of the AA has a slope of >5%, or is very close to the base of a natural slope longer than 100 and much steeper than the slope of the AA, AND the pH of surface water, If known, is >5.5.	0	
F51	Internal Gradient	Neither of above is true, although some groundwater may discharge to or flow through the AA. Or groundwater influx is unknown. The gradient along most of the flow path within the AA is:	1	This is not the same as the shoreline slope. It is the elevational difference between the AA's inlet and
		The gradient along most of the now pain within the AATS. The AA has no surface water outlet (not even seasonally).	1	outlet, divided by the flow-distance between them and converted to percent. If available, use a
		2-5%.	0	clinometer to measure this. Free clinometer apps can be downloaded to smartphones. If the wetland is large (longer than –1 km), this may be estimated using Google Earth to determine the minimum and
		6-10%. >10%.	0	maximum elevation within the AA, then dividing by length and multiplying by 100. [CS, NR, OE, PR, SR, WBF, WBN, WS]
		ions: If the AA lacks an upland edge, evaluate based on the AA's entire perimeter, and moving outward into whatever areas are		
adjace F52	nt. In many situations, the Vegetated Buffer as %	nese questions are best answered by measuring from aerial images. essor (S) Data Form for Non-Ti	dal Wetlands. WESP-AC for New B	runswick. Version 2.		Dat
Aberrant Timing of Water Inputs				Dat
	likely to have caused the timing of water inputs (but not necessarily their	r valuma) to chift by hours, days, or weeks, becoming either more	mutad (emallar ar loss fraquent peaks spread over langer time	
	shy (larger or more frequent spikes but over shorter times). [FA, FR, IN]		muteu (smailer of less frequent peaks spread over longer times	
Stormwater from impervious surfaces that drains directly to the	e wetland.			
Water subsidies from wastewater effluent, septic system leak	age, snow storage areas, or irrigation.			
Regular removal of surface or groundwater for irrigation or oth	er consumptive use.			
Flow regulation in tributaries or water level regulation in adjoin	ing water body, or other control structure at water entry points that regu	lates inflow to the wetland.		
*	from the wetland that interferes with surface or subsurface flow in/ou	t of the AA (e.g., road fill, wellpads, pipelines).		
Excavation within the wetland, e.g., dugout, artificial pond, de	ad-end ditch.			
Artificial drains or ditches in or near the wetland.				
Accelerated downcutting or channelization of an adjacent or in	ternal channel (incised below the historical water table level).			
Logging within the wetland.				
Subsidence or compaction of the wetland's substrate as a res				
Straightening, ditching, dredging, and/or lining of tributary cha		no managerable offers on the timing of vector conditions in any part of	of the AA than leave the "O's" for the searce in the following row	
	e below, assign points. However, if you believe the checked items had n dition if the checked items never occurred or were no longer present.	o measurable effect on the uning of water conditions in any part o	n uie nn, alen leave uie -0 s -101 tile scoles III tile following ron	
	Severe (3 points)	Medium (2 points)	Mild (1 point)	
Spatial extent of timing shift within the wetland:	>95% of wetland.	5-95% of wetland.	<5% of wetland.	
When most of the timing shift began:	<3 yrs ago.	3-9 yrs ago.	10-100 yrs ago.	
Score the following 2 rows only if the altered inputs began with	in past 10 years, and only for the part of the wetland that experiences th	ose.		
Input timing now vs. previously:	Shift of weeks.	Shift of days.	Shift of hours or minutes.	
Flashiness or muting:	Became very flashy or controlled.	Intermediate.	Became mildly flashy or controlled.

Songbird, Raptor, & Mammal Habitat (SBM)	6.77	Moderate	2.50	Lower	5.61	2.50
Pollinator Habitat (POL)	9.45	Higher	10.00	Higher	7.61	10.00
Native Plant Habitat (PH)	5.94	Moderate	10.00	Higher	5.48	10.00
Public Use & Recognition (PU)			2.33	Lower		1.99
Wetland Sensitivity (Sens)			1.75	Lower		2.73
Wetland Ecological Condition (EC)			8.55	Higher		9.17
Wetland Stressors (STR) (higher score means more stress)			0.39	Lower		2.40
Summary Ratings for Grouped Functions:						
HYDROLOGIC Group (WS)	4.69	Moderate	0.37	Lower	5.99	0.45
WATER QUALITY SUPPORT Group (max+avg/2 of SR, PR, NR, CS)	6.32	Higher	1.23	Lower	7.80	1.87
AQUATIC SUPPORT Group (max+avg/2 of SFS, INV, OE, WC)	4.30	Moderate	2.17	Moderate	4.34	1.47
AQUATIC HABITAT Group (max+avg/2 of FA, FR, AM, WBF, WBN)	0.54	Lower	0.61	Lower	2.27	1.62
TRANSITION HABITAT Group (max+avg/2 of SBM, PH, POL)	8.42	Higher	8.75	Higher	6.92	8.75
WETLAND CONDITION (EC)			8.55	Higher		9.17
WETLAND RISK (average of Sensitivity & Stressors)			1.07	Lower		2.57
	NOTE: A	6 0 - 1			e abcent from t	an made and 14

NOTE: A score of 0 does not mean the function or benefit is absent from the wetland. It means only that this wetland has a capacity that is equal or less than the lowest-scoring one, for that function or benefit, from among the 98 NB calibration wetlands that were assessed previously.

Cover Page: Basic Description of Assessment	WESP-AC version 2
Site Name:	Burchill Wind Energy Project - FC-Trib1-W-04
Investigator Name:	Derrick Mitchell
Date of Field Assessment:	14 October 2019
Nearest Town:	Lorneville (west Saint John), New Brunswick
Latitude (decimal degrees):	45.194758
Longitude (decimal degrees):	-66.20425
Is a map based on a formal on-site wetland delineation available?	Yes
Approximate size of the Assessment Area (AA, in hectares):	4.8
AA as percent of entire wetland (approx.). Attach sketch map if AA is smaller than the entire contiguous wetland.	80
What percent (approx.) of the wetland were you able to visit?	80
What percent (approx.) of the AA were you able to visit?	100
Were you able to ask the site owner/manager about any of the questions?	No
Indicate here if you intentionally surveyed for rare plants, calciphile plants, or rare animals	Yes
Have you attended a WESP-AC training session? If so, indicate approximate month & year	Yes, September 2016
How many wetlands have you assessed previously using WESP-AC? (approx.)	100+
Comments about the site or this WESP-AC assessment (attach extra page if desired):	

Form OF (Office). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Conduct an assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answering many of the questions below will equire using these online map viewers:

Google Earth Pro: https://www.google.com/earth/download/gep/agree.html

GeoNB: http://www.snb.ca/geonb1/ and http://www.snb.ca/geonb1/e/apps/apps-E.asp

Geons: http://www.snb.ca/geonol/ and http://www.snb.ca/geonol/e/apps/apps/apps-ta-asp For most wetlands, completing this office data form will require 1-2 hours. For a list of functions to which each question pertains, see bracketed abbreviations in the Definitions/Explanations column. For detailed descriptions of each WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity,

DE4E	Tidal Drawlerite	>10 km.	0	In Coords Earth, measure the distance to the account fleetings.
OF15	Tidal Proximity	The distance from the AA edge to the closesttidal water body (regardless of its salinity) is:		In Google Earth, measure the distance to the ocean (including Bay of Fundy) or tidal river, whicheve is closer. If you need to see how far upriver a river is tidal, see the KMZ file provided with this
		<100 m.	0	calculator for NB (NB Headtide). Points shown in those files are only an approximation, so local
		100 m - 1 km. 1 - 5 km.	0	information if available may be preferable. [FA, WBF]
		5-10 km.	0	
		10-40 km.	0	
		>40 km.	0	
OF16	Upland Edge Contact	Select one: The AA has no upland edge (or upland is <1% of perimeter). The AA is entirely surrounded by (& contiguous with) other wetlands or water	0	[NR, SBM, Sens]
		1-25% of the AA's perimeter abuts upland (including filled areas). The rest adjoins other wetlands or water that is mostly wider than the AA	0	
			0	
		25-50% of the AA's perimeter abuts upland. The rest adjoins other wetlands or water that is mostly wider than the AA. 50-75% of the AA's perimeter abuts upland. The rest adjoins other wetlands or water that is mostly wider than the AA.	0	
		More than 75% of the AA's perimeter abuts upland. Any remainder adjoins other wetlands or water that is mostly wider than the AA.This	1	
OF17	Flood Damage from Non-	will be true for most assessments done with WESP-AC. Within 5 km downstream or downslope of the AA (select first true choice):		In the GeoNB map viewer: click on "More" in upper right, then "Flood Information". Expand the menu
01 17	tidal Waters	Maps show Flood Zone or Flood Risk areas and there appears to be infrastructure vulnerable to river flooding not caused by tidal storm	0	under it by clicking on the arrow to its left and the slider to its right. Uncheck the first (Limits of Data)
		surges.	0	box. Where available, LiDAR imagery can provide finer elevational resolution useful for flood modeling. [WSv]
		Maps show Flood Zone or Flood Risk areas, but infrastructure is absent or is not vulnerable to floods from a non-tidal river. In some cases levees, upriver dams, or other measures may partly limit damage or risk from smaller events.	0	
		herees, opinied usins, or other measures may party minit usinate or his from shader events. Maps do not show Flood Zone or Flood Risk areas for no such mapping has been done locally) and there appears to be infrastructure vulnerable to river flooding urrelated to tidal storm surges.	0	
		Maps do not show Flood Zone or Flood Risk areas (or no such mapping has been done locally) and there is no infrastructure vulnerable to river flooding unrelated to tidal storm surges.	1	
OF18	Relative Elevation in Watershed	In Google Earth, enable the Terrain layer (lower left menu) and open the NB_Watersheds KMZ file that accompanies this calculator. Then determine the AA's approximate elevation (bottom right, NOT the "eye alt"). Then move cursor around to determine the watershed's maximum and minimum elevation. Divide the AA's elevation by the (max-min).	0.20	[FA, NR, Sens, SFSv, WCv, WSv]
OF19	Water Quality Sensitive Watershed or Area	In Google Earth, open the KMZ file NB_Watershed Protected Area which accompanies this calculator. The AA is within such an area. Enter 1= yes, 0= no.	0	If an ACCDC report is available for this AA, it also may contain such information. [NRv]
OF20	Degraded Water Upstream	Sampling indicates a problem with concentrations ofmetals, hydrocarbons, nutrients, or other substances (excluding bacteria, acidic water, high temperatures) being present at levels harmful to aquatic life or humans, and:		May use existing data, or sample those waters as part of this wetland assessment. "Harmful" should be evaluated with regard to current federal or provincial water quality standards. JAM, FA, FR, NRV,
		The condition is present within the AA.	0	PRv, SRv, STR, WBF, WBN]
		The condition is present in waters within 1 km that flowinto the AA, but has not been documented in the AA itself.	0	
		Sampling during both low water periods and times with high runoff (storms, snowmelt) indicates no problems in either the AA or inflowing waters.	0	
		Data are insufficient (no or inadequate sampling within 1 km, or condition exists only at >1 km upstream)This is the situation for nearly	1	
OF21	Degraded Water	all wetlands in this region. The problem described above is downslope from the AA, and:		May use existing data, or monitor waters as part of this wetland assessment. [NRv, PRv, SRv]
0121	Downstream	The condition is present within 1 km downslope and connected to the AA by a channel.		may ase existing data, or mornior waters as part or this welland assessment. [MVV, 11VV, 51VV]
		The condition is present within 1 km downslope and connected to the AA by a channel. The condition is present within 5 km downslope and connected to the AA by a channel, or within 1 km but not connected to the AA by a	0	
		channel.		
		Sampling during both low water periods and times with high runoff (storms, snowmelt) indicates no problems in either the AA or inflowing waters. National State of the Committee of the Committe	0	
		Data are insufficient (no or inadequate sampling within 1 km, or condition exists only at >1 km upstream)This is the situation for nearly all wetlands in this region.		
OF22	Wetland as a % of Its Contributing Area (Catchment)	From a lopographic map and field observations, estimate the approximate boundaries of the catchment (CA) of the entire weltand of which he Ah may be only a part. Then adjust those boundaries if necessary based on your field observations of the surrounding terrain, and/or busing procedures described in the Manual. Divide the area of the weltand (not just the AA) by the approximate area of its catchment excluding the area of the weltand itself. When doing the calculation, if ponded water is adjacent to the weltand, include that in the weltand area. The result is: -0.01, or catchment size unknown due to stormwater pipes that collect water from an indeterminate area.	0	Topographic maps may be viewed online at the National Allas of Canada (Toporama): http://atlas.gc.ca/toporama/en/index.html [NR, PR, Sens, SR, WS]
		0.01 to 0.1.	0	
		0.1 to 1.	1	
		>1 (wetland is larger than its catchment (e.g., wetland with flat surrounding terrain and no inlet, or is entirely isolated by dikes, or is a raised bog).	0	
OF23	Unvegetated Surface in the Contributing Area	The proportion of the AA's contributing area (measured to no more than 1000 m upslope) that is comprised of buildings, roads, parking lots other pavement, exposed bedrock, landstides, and other mostly-bare surface is about:		[FA, INV, NRv, PRv, SRv, STR, WCv, WSv]
		<10%.	1	
		10 to 25%. > 25%.	0	
		ream.	U	<u> </u>

OF24	Transport From Upslope	A relatively large proportion of the precipitation that falls farther upslope in the CA reaches this wetland quickly as runoff (surface water), as		[NRv, PRv, SRv, WSv]
		indicated by the following: (a) input channel is present,		
		(b) input channels have been straightened,		
		(c) upslope wetlands have been ditched extensively, (d) land cover is mostly non-forest,		
		(e) CA slopes are steep, and/or		
		(f) most CA soils are shallow (bedrock near surface) and/or have high runoff coefficients. This statement is:		
		This statement is:		
		Mostly true.	0	
		Somewhat true.	0	
		Mostly untrue.	1	
OF25	Aspect	The overland flow direction of most surface water (in streams, rivers, or runoff) that enters the AA is:		[AM, NR, SFS, WC, WS]
		Northward (N, NE). north-facing contributing area.	0	
		Southward (S, SW), south-facing contributing area.	1	
OF26	Internal Flow Distance	Other (E, SE, W, NW), or no detectable uphill slope or input channel (flat). The horizontal flow distance from the wetland's inlet to outlet is:	0	Identify inlets and outlets, if any, from topographic maps (use elevations to determine which are inlet
01 20	(Path Length)			and which are outlets) and augment by field inspection. [NR, OE, PR, SR, WS]
		<10 m. 10 - 50 m.	0	
		50 - 100 m.	0	
		100 - 1000 m.	1	
		1- 2 km.	0	
		>2 km, or wetland lacks an inlet and outlet.	0	
	Growing Degree Days	In Google Earth, open the KMZ file that accompanies this calculator, called NB-PEL_GrowingDegreeDays. Place your cursor over the AA and left-click. From the pop-up, enter the GRIDCODE in the next column.	2428	This layer was provided by Dr. Dan McKenney of the Canadian Forest Service [AM, CS, FR, INV, NR, OE, PH, PR, Sens, SR, WBF, WCv, WS]
OF28	Fish Access or Use	According to agency biologists and/or your own observations, the AA. [Nark just the first choice that is true.]:		Regarding the last choice, if uncertain if an AA is fishless, consider the possibility its waters have been stocked. In NB, the list of stocked waters is at:
		Is known to support rearing and/or spawning by Atlantic salmon or other anadromous species or eels. In NB, consult Figure A-2 in	0	stocked. In NB, the list of stocked waters is at: http://www2.gnb.ca/content/gnb/en/departments/erd/natural_resources/content/fish/content/Stocked\
		Appendix A of the Manual. Contact local fishery biologists, review the ACCDC report, and visit these websites: http://www.salmonatlas.com/atlanticsalmon/canada-east/index.1.html http://atlanticsalmon/ederation.org/rivers/introduction.html		aters.html
		Has not been documented to support Atlantic salmon rearing and/or spawning, but is connected to nearby waters likely to contain Atlantic	0	[AM, FA, FR, INV, WBF, WBN]
		salmon or other anadromous species or eels and is probably accessed by those during some conditions.	U	
		Is probably is not accessed by any anadromous fish species but is known or likely to havother fish at least seasonally.	0	
		is known or likely to be fishless (e.g., too small, dry, and/or not accessible even temporarily, and not stocked).	1	
OF29	Species of Conservation Concern	Within the past 10 years, in the AA (or in its adjoining waters or wetland), qualified observers have documented mark all applicable:		Request information from ACCDC and/or conduct your own survey at an appropriate season using a approved protocol. For birds, also check eBird.org. [AMv, EC, PHv, POLv, SBMv, Sens, WBFv,
		Presence of one or more of the plant species listed in the Plants_Rare worksheet of the accompanying Supplnfo file, or the AA is within a	1	WBNv]
		mapped Atlantic Coastal Plain Flora Buffer		
		Presence of one or more of the amphibian or reptile species (AM) of conservation concern as listed in the Wildlife_Rare worksheet of the	0	
		accompanying Supplinfo file.	0	
		Presence of one or more of the waterbird species (WBF, WBN) of conservation concern as listed in the Wildlife_Rare worksheet of the accompanying Supplnfo file.	0	
		Presence of one or more of the nesting songbird or raptor species (SBM) of conservation concern as listed in the Wildlife_Rare workshee	0	
		of the accompanying SuppInfo file, during their nesting season (May-July for most species).		
OF30	Important Bird Area	None of the above, or no data. In Google Earth, open the KMZ file that accompanies this calculator, calledBAs_Canada. The AA is all or part of an officially designated.	0	The source of this layer, which should be checked periodically for updates, is:
01 30	(IBA)	IBA. Enter 1= yes, 0= no.	U	http://www.ibacanada.com/mapviewer.jsp?lang=EN [SBMv, WBFv, WBNv]
OF31	Black Duck Nesting Area	In Google Earth, open the KMZ file that accompanies this calculator, called BlackDuck. Adjust its alignment and opacity. Determine the predicted density (pairs per 25 sq, km) of nestling American Black Duck in the AA's vicinity: <10 (enter 0), 10-20 (enter 1), 20-30 (enter 2), >30 (enter 3), if outside of region shown in map, change toblank.	0	This was provided by Dr. David Leske. [WBNv]
OF32	Wintering Deer or Moose	If AA is on private land with no information, change to blank (not 0). If on public/crown land, in Google Earth open the KMZ file that	0	(SBM)
	Concentration Areas	accompanies this report called NB_DeerWinteringAreas.Otherwise: Enter: yes= 1, no= 0.		
OF33	Other Conservation	With GeoNB, click on Candidate PNA Map Viewer to identify Provincially Significant Wetland, Environmentally Significant Area, Protected	0	[PU]
	Designation	Natural Area but also include if the AA is all or part of an area designated by government, First Nations, or the Nature Conservancy of		
		Canada (NCC) for its exceptional ecological features or highly intact natural conditions. Enter: yes= 1, no= 0. If uncertain, consult NCC ar agencies for more recent information.		
OF34	Conservation Investment	The AA is part of or contiguous to a wetland on which public or private organizational funds were spent to preserve, create, restore, or	0	[PU]
		enhance the wetland (excluding mitigation wetlands). Ask the property owner. Enter: yes= 1, no= 0. If no information, change tollank (not		
OF35	Mitigation Investment	0). The AA is all or part of a mitigation site used explicitly to offset impacts elsewhere. Ask the property owner. Enter: yes= 1, no= 0. If no	0	[PU]
		Information, change to blank .		
OF36	Sustained Scientific Use	Plants, animals, or water in the AA have been monitored for >2 years, unrelated to any regulatory requirements, and data are available to the public. Or the AA is part of an area that has been designated by an agency or institution as a benchmark, reference, or status-trends	0	[PU]
		monitoring area. Ask the property owner. Enter: yes= 1, no= 0. If no information, change toblank.		
OF37	Calcareous Region	The AA is in an area that is at least partly underlain by soil, sediment, or bedrock that is highly calcareous (enter 3 in next column),	0	If GIS is available, you may use the Bedrock Geology shapefile obtainable at
		moderately calcareous (enter 2), or slightly calcareous (enter 1), none= 0. Limestone is typically a major component (karst geology) and water is not acidic (pH is usually >8). See Figure A-6 in Appendix A of the Manual. If no map coverage, change tablank.		http://www.snb.ca/geonb1/e/DC/catalogue-E.asp [AM, FA, FR, INV, PH]
OF38	Ownership	Select the ONE ownership that covers the most of the AA. In Google Earth, open KMZ file called NB Crown lands. Use more recent		"Private lands" may include those owned or leased by non-governmental organizations, e.g.,
		information if available.		charitable conservation land trusts, DUC, TNC. [PU, STR]
		New timber harvest, roads, mineral extraction, and intensive summer recreation (e.g., off-road vehicles) are permanently prohibited.	0	
		Includes many publicly-owned Protected Lands, and private lands under long-term (30+ year) legal agreements to maintain nearly-unaltere conditions.		
		Ownership is public (e.g., municipal, Crown Reservations/Notations) but some or all of the above activities are allowed.	1	
		Ownership is private but public access is allowed, and/or a shorter-term conservation easement (whether renewable or not) is in place.	0	
		Ownership is private and owner does not allow access, or access permission unknown, and not a conservation easement.	0

---------	----------------	--------------------------------	---------------	-----------	--------

Form F (Field). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Walk for no less than 10 minutes from the wetland edge towards its core, in the part of the AA that is proposed for alteration. If no alteration is proposed, walk in a portion that appears to be most representative of the wetland overall. Walk only where it is safe and legal to do so. Conduct the assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answer these questions primarily based on your onsite observations and interpretations. Do not write in shaded parts of this data form. Answering some questions accurately may require conferring with the landowner or other knowledgable persons and/or reviewing aerial imagery. For most wetlands, completing this field data form will require 1-2 hours on a site. For a list of functions to which each question pertains, see the accompanying Interpretations form. For detailed descriptions of each WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage & Delay, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity, STR= Stressors.

	I and to the	Countries of the		Definitions in 1
#	Indicators	Condition Choices	Data	Definitions/Explanations
1	Wetland Type	Follow the key below and mark the ONE row that best describes MOST of the vegetated part of the AA:		Ericaceous shrubs are ones in the heather family (Ericaceae). Most have leathery evergreen leaves. They include rhododendron, azalea, swamp laurel, leatherleaf, Labrador tea, and others. Most require
		A. Moss and/or lichen cover more than 25% of the ground. Often dominated by ericaceous shrubs (e.g., Labrador tea) or other acid-tolerant plants (e.g., bog cranberry, pitcher plant, sundew, orchids). Substrate is mostly undecomposed peat. Choose between A1 and A2 and mark the choice with a 1 in their adjoining column. Otherwise go to B below.		acidic soil. Although not in the family Ericaceae, sweetgale (Myrica gale) should be counted also. [AM, CS, FA, FR, INV, NR, OE, PH, Sens, SFS, WBF, WBN]
		A1. Surface water is usually absent or, if present, pH is typically <4.5 and conductivity is usually <100 µS/cm (<64 ppm TDS). Trees are absent or nearly so. Sedge cover usually sparse or absent but cottongrass and/or lichen cover may be extensive, as well as cloudberry, lingonberry, sheep laurel, and a sedge (Carex rarillora). Welfand surface and surrounding landscape are seldom sloping and welfand often is domed (convex). Inlet and outlet channels are usually absent. If known, pH of peat is <4.0.	0	
		A2. Not A1. Surface water, if present, has pH typically >4.5 and conductivity is usually >100 µS/cm (>64 ppm TDS). Sedge cover is usually extensive, and/or tree and fall shrub cover is extensive. Sometimes at toe of slope or edge of water body. An exit channel is usually present. Wetter than A1 and peat depth may be shallower (<2 m).	0	
		B. Moss and/or lichen cover less than 25% of the ground. Soil is mineral or decomposed organic (muck). Choose between B1 and B2 and mark the choice with a 1 in their adjoining column:		
		B1. Trees and shrubs taller than 1 m comprise more than 25% of the vegetated cover. Surface water is mostly absent or inundates the vegetation only seasonally (e.g., vernal pools or floodplain).	1	
		B2. Not B1. Tree & tall shrubs comprise less than than 25% of the vegetated cover. Vegetation is mostly herbaceous, e.g., cattail, bulrush, burreed, pond lily, horsetail. Surface water may be extensive and fluctuates seasonally, being either persistent or drying up partly or entirely.	0	
NA sh nclud adja lescn	ould also include part of i le the open water part adj cent " is used synonymoo lbed features along their i	the AA should include all persistent waters in ponds smaller than 8 hectares (-283 m on a side) that are adjacent to the AA. The the water area of adjacent ponded water larger than 8 ha and adjacent rivers wider than 20 m. Specifically, the AA should jacent to wetland vegetation and equal in width to the average width of that vegetated zone. Throughout this data form, usly with abutting, adjoining, bordering, contiguous and means no upland (manmade or natural) completely separates the directly shared edge. Features joined only by a channel are not necessarily considered to be adjacent a large portion of their res do not have to be hydrologically connected in order to be considered adjacent.		
2	Wetland Types - Adjoining or Subordinate	If the AA is smaller than 1 ha, mark all other types that occupy more than 1% of the vegelated AA. If the AA is larger than 1 ha, mark all other types which are within or adjacent to the AA and occupy more than 1 ha, as visible from the AA or as interpreted from aerial imagery. Do not mark again the type marked in F1.		T hectare is 10,000 sq. m or about 2.5 acres. It could have dimensions of 100 m by 100 m, 1000 m by 10 m, or similar. [AM, INV, SBM, WBF]
		A1. A2.	0	
		B1.	0	
3	Woody Height & Form Diversity	B2. Following EACH row below, indicate with a number code the percentage of the living vegetation in the AA which is occupied by that feature (6 if >95%, 5 if 75-95%, 4 if 50-75%, 3 if 25-50%, 2 if 5-25%, 1 if <5%, 0 if none). If the vegetated part of the AA is largely herbaceous (non-woody) vegetation, these percentages should not sum to 100%.		Deciduous shrubs in this region usually include buttonbush, Labrador tea, bayberry (Moreilla), huckleberry, cranberry, cloudberry, sweetgale, alder, willow, birch, ash, dogwood, and a few others. If you assigned a code of 3 or higher to any of the first four choices and the ground cover beneath the
		coniferous trees (may include tamarack) taller than 3 m.	5	trees/shrubs is <25% moss, then question F1 might be "B1". [CS, INV, NR, PH, POL, SBM, Sens]
		deciduous trees taller than 3 m. coniferous or ericaceous shrubs or trees 1-3 m tall not directly below the canopy of trees.	2	
		deciduous shrubs or trees 1-3 m tall not directly below the canopy of trees.	2	
		coniferous or ericaceous shrubs <1 m tall not directly below the canopy of taller vegetation. deciduous shrubs or trees <1 m tall (e.g., deciduous seedlings) not directly below the canopy of taller vegetation.	1	
lote :		F3 was marked 2 or greater , SKIP to F9 (N fixers).		
4	Dominance of Most Abundant Shrub	Determine which two woody plant species comprise the greatest portion of the low (<3 m) woody cover . Then choose one:		[PH, POL, SBM, Sens]
	Species	those species together comprise > 50% of such cover. those species together do not comprise > 50% of such cover.	0	
5	Woody Diameter Classes	Mark ALL the types that comprise >5% of the woody canopy cover in the AA or >5% of the wooded areas (if any) along its upland edge (perimeter). The edge should include only the trees whose canopies extend into the AA.		Estimate the diameters at chest height. If small-diameter trees are overtopped (shaded) by larger ones, visualise a "subcanopy" at the average height of the smaller-dbh trees, to serve as a basis for t
		coniferous, 1-9 cm diameter and >1 m tall. broad-leaved deciduous 1-9 cm diameter and >1 m tall.	1	minimum 5% canopy requirement in this question. The trees and shrubs need not be wetland species [AM, CS, POL, SBM, Sens, WBN]
		coniferous, 10-19 cm diameter.	1	
		broad-leaved deciduous 10-19 cm diameter.	1	
		coniferous, 20-40 cm diameter. broad-leaved deciduous 20-40 cm diameter.	1	
		coniferous, >40 cm diameter.	1	
,	Heiseld Oless	broad-leaved deciduous >40 cm diameter.	0	TAM INV AID DIL COM Coort
)	Height Class Interspersion	Follow the key below and mark the ONE row that best describes MOST of the AA: A. Neither the vegetation taller than 1 m nor the vegetation shorter than that comprise >70% of the vegetated part of the AA. They each comprise 30-70%. Choose between A1 and A2 and mark the choice with a 1 in the adjoining column. Otherwise go to B below.		[AM, INV, NR, PH, SBM, Sens]
		A1. The two height classes are mostly scattered and intermixed throughout the AA.	0	
		A2. Not A1. The two height classes are mostly in separate zones or bands, or in proportionately large clumps. B. Either the vegetation shorter than 1 m comprises >70% of the vegetated part of the AA, or the vegetation taller than that does. One size	1	
		class might even be totally absent. Choose between B1 and B2 and mark the choice with a 1 in the adjoining column: B1. The less prevalent height class is mostly scattered and intermixed within the prevalent one.	0	
			U	
7	Large Snans (Dead	B2. Not B1. The less prevalent height class is mostly located apart from the prevalent one, in separate zones or clumps, or is completely absent. The number of large snags (diameter >20 cm) in the AA plus adjacent upland area within 10 m of the wetland edge is:		Snags are dead standing trees that often (not always) lack bark and foliage. Include only ones that a

FieldF form - Non-tidal Page 3 of 5

F37	Interspersion of	During most of the part of the growing season when water is present, the spatial pattern of emergent vegetation within the water is mostly:		[AM, FA, FR, INV, NR, OE, PH, PR, SBM, SR, WBF, WBN]
	Emergents & Open Water	Scattered. More than 30% of such vegetation forms small islands or corridors surrounded by water.	0	
	water	Intermediate.	0	
		Clumped. More than 70% of such vegetation is in bands along the wetland perimeter or is clumped at one or a few sides of the surface water area.	0	
F38	Persistent Deepwater	If the deepest patch of surface water (flowing or ponded) in or directly adjacent to the AA is mostly deeper than 0.5 m for >2 weeks during the	0	
F39	Area Non-vegetated Aquatic	growing season, enter "1" and continue. If not, enter "0" and SKIP to F42.(Connection). During most of the growing season and in waters deeper than 0.5 m, the cover for fish, aquatic invertebrates, and/or amphibians that is		For this question, consider only the wood that is at or above the water surface. Estimates of underwater
137	Cover	provided NOT by living vegetation, but by accumulations of dead wood and undercut banks is:		wood based only on observations from terrestrial viewpoints are unreliable so should not be attempted.
		Little or none. Intermediate.	0	[AM, FA, FR, INV]
		Extensive.	0	
F40	Isolated Island	The AA contains (or is part of) an island or beaver lodge within a lake, pond, or river, and is isolated from the shore by water depths > 1 m on all sides during an average June. The island may be solid, or it may be a floating vegetation mat that is sufficiently large and dense to support a waterbird nest.	0	[WBN]
	Duckweed	Al some time of the year, mats of algae and/or duckweed are likely to cover >50% of the AA's otherwise-unshaded water surface, or blankel >50% of the underwater substrate. If true, enter "1" in next column. If untrue or uncertain, enter "0".	0	[EC, PR, WBF]
F42	Channel Connection & Outflow Duration	The most persistent surface water connection (outlet channel or pipe, ditch, or overbank water exchange) between the AA and a downslope stream network is: [Note: If the AA represents only part of a welland, answer this according to whichever is the least permanent surface connection: the one between the AA and the rest of the wetland, or the surface connection between the wetland and the downslope stream network.] Persistent (surface water flows out for >9 months/year).	0	Consider the connection regardless of whether the surface water is frozen. The "downslope stream network" could consist of ditches, rivers, ponds, or lakes which eventually connect to the ocean. If this cannot be determined while visiting the AA, consult topographic maps perhaps by viewing these online with Toporama (http://atlas.nrcan.gc.ca/toporama/en/index.html) [CS, FA, FR, NR, OE, PR, Sens, SFS SR, WCv, WS]
		Seasonal (surface water flows out for 14 days to 9 months/year, not necessarily consecutive).	0	
		Temporary (surface water flows out for <14 days, not necessarily consecutive). None but maps show a stream network downslope from the AA and within a distance that is less than the AA's length. SKIP to F47 (pH	0	
		Measurement).		
		No surface water flows out of the wetland except possibly during extreme events (<once (ph="" 10="" a="" an="" ditch,="" f47="" flows="" into="" lacks="" lake="" measurement).<="" only="" or="" or,="" outlet.="" per="" skip="" td="" that="" to="" water="" wetland,="" years).=""><td>0</td><td></td></once>	0	
F43	Outflow Confinement	During major runoff events, in the places where surface water exits the AA or connected waters nearby, the water:		"Major runoff events" would include biennial high water caused by storms and/or rapid snowmelt. [CS, NR, OE, PR, Sens, SR, STR, WS]
		Mostly passes through a pipe, culvert, narrowly breached dike, berm, beaver dam, or other partial obstruction (other than natural topography) that does not appear to drain the wetland artificially during most of the growing season.	0	
		Leaves through natural exits (channels or diffuse outflow), not mainly through artificial or temporary features. Is exported more quickly than usual due to ditches or pipes within the AA or connected to its outlet, or within 10 m of the AA's edge, which	0	
		drain the wetland artificially, or water is pumped out of the AA.	U	
F44	Tributary Channel	At least once annually, surface water from a tributary channel that is >100 m long moves into the AA. Or, surface water from a larger permanent water body adjacent to the AA spills into the AA. If it enters only via a pipe, that pipe must be fed by a mapped stream or lake further upslope. If no, SKIP to F47 (pH Measurement).	0	If inlet tributaries cannot be searched for due to inaccessibility of part of the AA, follow suggestions in F42 above. [NRv, PH, PRv, SRv]
F45	Input Water Temperature	Based on lack of shade, water source characteristics, or actual temperature measurements, the inflow is likely to be warmer than surface water in the AA during part of most years. Enter 1= yes, 0= no.	0	[WCv]
F46	Throughflow	During its travel through the AA at the time of peak annual flow, water arriving in channels: [select only the ONE encountered by most of the incoming water].		[FA, FR, INV, NR, OE, PR, SR, WS]
	Resistance	Does not bump into many plant stems as it travels through the AA. Nearly all the water continues to travel in unvegetated (often incised)	0	
		channels that have minimal contact with welland vegetation, or through a zone of open water such as an instream pond or lake.		
		Bumps into herbaceous vegetation but mostly remains in fairly straight channels. Bumps into herbaceous vegetation and mostly spreads throughout, or is in widely meandering, multi-branched, or braided channels.	0	
		bumps into trendaceous vegeration and mostly spreads intrognour, or is in watery meanitiening, multi-maticited, or braided chainnels.	U	
		Bumps into tree trunks and/or shrub stems but mostly remains in fairly straight channels. Bumps into tree trunks and/or shrub stems and follows a fairly indirect path from entrance to exit (meandering, multi-branched, or braided).	0	
F47	pH Measurement	The pH in most of the AA's surface water:		Preferably, measure this in larger areas of ponded surface water within the AA, or in streams that have passed through (not along) most of the AA. Unless surface water is completely absent, do not dig holes
		Was measured, and is: [enter the reading in the column to the right.] Was not measured but surface water is present and is darkly tea-coloured. Or if no surface water, then mosses and plants that indicate	0	or make depressions in peat in order to provide water for this measurement. Avoid measuring near
		peatland (e.g., Labrador tea) are prevalent. Enter "1".		roads or in puddles formed only by recent rain. [AM, FA, FR, NR, WBF, PH, PR, Sens, WBF, WBN]
F48	TDS and/or	Neither of above. Enter "1". The TDS (total dissolved solids) or conductivity off the AA's surface water is: (select the first true row with information):	1	See above for measurement guidance. [FR, INV, NRv, PH, PRv, Sens]
	Conductivity	TDS is: [Enter the reading in ppm or mg/L in the column to the right, if measured, or answer next row.]		
		Conductivity is [Enter the reading in µS/cm in the column to the right.]	_	
		Was not measured, but plants that indicate saline conditions cover much of the vegetated AA. Enter *1". Neither of above	0	
F49	Beaver Probability	Use of the AA by beaver during the past 5 years is (select most applicable ONE):		[FA, FR, PH, SBM, Sens, WBF, WBN]
		Evident from direct observation or presence of gnawed limbs, dams, tracks, dens, lodges, or extensive stands of water-killed trees (snags).	0	
		Likely based on known occurrence in the region and proximity to suitable habitat, which may include: (a) a persistent freshwater wetland, pond, or lake, or a perennial low or mild-gradient (<10%) channel, and (b) a corridor or multiple stands of hardwood trees and shrubs in vegetated areas near surface water.	0	
Er.c	0 1 1 2	Unlikely because site characteristics above are deficient, and/or this is a settled area or other area where beaver are routinely removed.	1	
F50	Groundwater Strength of Evidence	Select first applicable choice: Springs are known to be present within the AA, or if groundwater levels have been monitored, that has demonstrated that groundwater primarily discharges to the wetland for longer periods during the year than periods when the wetland recharges the groundwater.	0	Adhere to these criteria strictly – do not use personal judgment based on fen conditions, pH, or other evidence. Consult topographic maps to detect breaks in slope described here. Rust deposits associated with groundwater seeps may be most noticeable as orange discoloration in ice formations abong streams during each writer. IAM CS EA EP INV NP OF PH DPV SES WIC WSI.
		Most of the AA has a slope of >5%, or is very close to the base of a natural slope longer than 100 and much steeper than the slope of the AA, AND the pH of surface water, if known, is >5.5.	0	along streams during early winter. [AM, CS, FA, FR, INV, NR, OE, PH, PRv, SFS, WC, WS]
		Neither of above is true, although some groundwater may discharge to or flow through the AA. Or groundwater influx is unknown.	1	
F51	Internal Gradient	The gradient along most of the flow path within the AA is:		This is not the same as the shoreline slope. It is the elevational difference between the AA's inlet and outlet, divided by the flow-distance between them and converted to percent. If available, use a
		<2% or the AA has no surface water outlet (not even seasonally). 2-5%.	0	clinometer to measure this. Free clinometer apps can be downloaded to smartphones. If the wetland is large (longer than -1 km), this may be estimated using Google Earth to determine the minimum and
		6-10%.	0	maximum elevation within the AA, then dividing by length and multiplying by 100. [CS, NR, OE, PR,
Note fo	or the next three quest	>10%. ions: If the AA lacks an upland edge, evaluate based on the AA's entire perimeter, and moving outward into whatever areas are	0	SR, WBF, WBN, WS]

Aberrant Timing of Water Inputs	Wollands: West As for New B	Turiowick: Voloion 2.	
,			
In the last column, place a check mark next to any item that is likely t more temporal homogeneity of flow or water levels) or more flashy (la			mutea (smaller of less frequent peaks spread over longer time:
Stormwater from impervious surfaces that drains directly to the wetle	and.	-	
Water subsidies from wastewater effluent, septic system leakage, so	now storage areas, or irrigation.		
Regular removal of surface or groundwater for irrigation or other cor	nsumptive use.		
Flow regulation in tributaries or water level regulation in adjoining wa	ater body, or other control structure at water entry points that regu	ulates inflow to the wetland.	
A dam, dike, levee, weir, berm, or fill within or downgradient from	the wetland that interferes with surface or subsurface flow in/ou	t of the AA (e.g., road fill, wellpads, pipelines).	
Excavation within the wetland, e.g., dugout, artificial pond, dead-end	J ditch.		
Artificial drains or ditches in or near the wetland.			
Accelerated downcutting or channelization of an adjacent or internal	channel (incised below the historical water table level).		
Logging within the wetland.			
Subsidence or compaction of the wetland's substrate as a result of r	nachinery, livestock, fire, drainage, or off road vehicles.		
Straightening, ditching, dredging, and/or lining of tributary channels.			
If any items were checked above, then for each row of the table below To estimate effects, contrast the current condition with the condition is		no measurable effect on the timing of water conditions in any part of	f the AA, then leave the "O's" for the scores in the following rov
	Severe (3 points)	Medium (2 points)	Mild (1 point)
Spatial extent of timing shift within the wetland:	>95% of wetland.	5-95% of wetland.	<5% of wetland.
When most of the timing shift began:	<3 yrs ago.	3-9 yrs ago.	10-100 yrs ago.
Score the following 2 rows only if the altered inputs began within pass	, ,	, ,	, , , , , , , , , , , , , , , , , , ,
Input timing now vs. previously:	Shift of weeks.	Shift of days.	Shift of hours or minutes.
Flashiness or muting:	Became very flashy or controlled.	Intermediate.	Became mildly flashy or controlled.

	NOTE: A scor	e of 0 does not	mean the func	tion or benefit i	s absent from t	ne wetland. It

NOTE: A score of 0 does not mean the function or benefit is absent from the wetland. It means only that this wetland has a capacity that is equal or less than the lowest-scoring one, for that function or benefit, from among the 98 NB calibration wetlands that were assessed previously.

Cover Page: Basic Description of Assessment	WESP-AC version 2
Site Name	Burchill Wind Energy Project - FC-Trib2-W-01
Investigator Name	Derrick Mitchell
Date of Field Assessment	14 October 2019
Nearest Town	Lorneville (west Saint John), New Brunswick
Latitude (decimal degrees)	45.193500
Longitude (decimal degrees)	-66.207134
Is a map based on a formal on-site wetland delineation available?	Yes
Approximate size of the Assessment Area (AA, in hectares)	1.0
AA as percent of entire wetland (approx.). Attach sketch map if AA is smaller than the entire contiguous wetland	100
What percent (approx.) of the wetland were you able to visit?	100
What percent (approx.) of the AA were you able to visit?	100
Were you able to ask the site owner/manager about any of the questions?	No
Indicate here if you intentionally surveyed for rare plants, calciphile plants, or rare animals	Yes
Have you attended a WESP-AC training session? If so, indicate approximate month & year	Yes, September 2016
How many wetlands have you assessed previously using WESP-AC? (approx.	100+
Comments about the site or this WESP-AC assessment (attach extra page if desired)	

Form OF (Office). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Conduct an assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answering many of the questions below will equire using these online map viewers:

Google Earth Pro: https://www.google.com/earth/download/gep/agree.html

GeoNB: http://www.snb.ca/geonb1/ and http://www.snb.ca/geonb1/e/apps/apps-E.asp

Geons: http://www.snb.ca/geonol/ and http://www.snb.ca/geonol/e/apps/apps/apps-ta-asp For most wetlands, completing this office data form will require 1-2 hours. For a list of functions to which each question pertains, see bracketed abbreviations in the Definitions/Explanations column. For detailed descriptions of each WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity,

Form F (Field). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Walk for no less than 10 minutes from the wetland edge towards its core, in the part of the AA that is proposed for alteration. If no alteration is proposed, walk in a portion that appears to be most representative of the wetland overall. Walk only where it is safe and legal to do so. Conduct the assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answer these questions primarily based on your onsite observations and interpretations. Do not write in shaded parts of this data form. Answering some questions accurately may require conferring with the landowner or other knowledgable persons and/or reviewing aerial imagery. For most wetlands, completing this field data form will require 1-2 hours on a site. For a list of functions to which each question pertains, see the accompanying Interpretations form. For detailed descriptions of each WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage & Delay, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity, STR= Stressors.

	Indicatan	Condition Challenge	Deta	Definitions In
#	Indicators	Condition Choices	Data	Definitions/Explanations
1	Wetland Type	Follow the key below and mark the ONE row that best describes MOST of the vegetated part of the AA:		Ericaceous shrubs are ones in the heather family (Ericaceae). Most have leathery evergreen leaves. They include rhododendron, azalea, swamp laurel, leatherleaf, Labrador tea, and others. Most require
		A. Moss and/or lichen cover more than 25% of the ground. Often dominated by ericaceous shrubs (e.g., Labrador tea) or other acid-tolerant plants (e.g., bog cranberry, pitcher plant, sundew, orchids). Substrate is mostly undecomposed peat. Choose between A1 and A2 and mark the choice with a 1 in their adjoining column. Otherwise go to 8 below.		acidic soil. Although not in the family Ericaceae, sweetgale (<i>Myrica gale</i>) should be counted also. [AM, CS, FA, FR, INV, NR, OE, PH, Sens, SFS, WBF, WBN]
		A1. Surface water is usually absent or, if present, pH is typically <4.5 and conductivity is usually <100 µSicm (<64 ppm TDS). Trees are absent or nearly so. Sedge cover usually sparse or absent but cottongrass and/or lichen cover may be extensive, as well as cloudberry, lingonberry, sheep laurel, and a sedge (Carex rarillora). Wetland surface and surrounding landscape are seldom sloping and wetland often is domed (convex). Inlet and outlet channels are usually absent. If known, pH of peat is <4.0.	0	
		A2. Not A1. Surface water, if present, has pH typically >4.5 and conductivity is usually >100 µS/cm (>64 ppm TDS). Sedge cover is usually extensive, and/or tree and fall shrub cover is extensive. Sometimes at toe of slope or edge of water body. An exit channel is usually present. Wetter than A1 and peat depth may be shallower (<2 m).	0	
		B. Moss and/or lichen cover less than 25% of the ground. Soil is mineral or decomposed organic (muck). Choose between B1 and B2 and mark the choice with a 1 in their adjoining column:		
		B1. Trees and shrubs taller than 1 m comprise more than 25% of the vegetated cover. Surface water is mostly absent or inundates the vegetation only seasonally (e.g., vernal pools or floodplain).	1	
		B2. Not B1. Tree & tall shrubs comprise less than than 25% of the vegetated cover. Vegetation is mostly herbaceous, e.g., cattail, bulrush, burreed, pond lily, horsetail. Surface water may be extensive and fluctuates seasonally, being either persistent or drying up partly or entirely.	0	
A sh ncludi adja lescri	ould also include part of i le the open water part adj cent " is used synonymou ibed features along their u	The AA should include all persistent waters in ponds smaller than 8 hectares (-283 m on a side) that are adjacent to the AA. The the water area of adjacent ponded water larger than 8 ha and adjacent rivers wider than 20 m. Specifically, the AA should jacent to wetland vegetation and equal in width to the average width of that vegetated zone. Throughout this daform, usly with abutting, adjoining, bordering, contiguous and means no upland (manmade or natural) completely separates the directly shared edge. Features joined only by a channel are not necessarily considered to be adjacent a large portion of their res do not have to be hydrologically connected in order to be considered adjacent.		
2	Wetland Types - Adjoining or Subordinate	If the AA is smaller than 1 ha, mark all other types that occupy more than 1% of the vegetated AA. If the AA is larger than 1 ha, mark all other types which are within or adjacent to the AA and occupy more than 1 ha, as visible from the AA or as interpreted from aerial imagery. Do not mark again the type marked in F1.		1 hectare is 10,000 sq. m or about 2.5 acres. It could have dimensions of 100 m by 100 m, 1000 m b 10 m, or similar. [AM, INV, SBM, WBF]
		A1. A2.	0	
		B1.	1	
		B2.	0	
3	Woody Height & Form Diversity	Following EACH row below, indicate with a number code the percentage of the living vegetation in the AA which is occupied by that feature (6 if -95%, 5 if 75-95%, 4 if 50-75%, 3 if 25-50%, 2 if 5-25%, 1 if -5%, 0 if none). If the vegetated part of the AA is largely herbaceous (non-woody) vegetation, the percentages should not sum to 100%.		Deciduous shrubs in this region usually include buttonbush, Labrador tea, bayberry (Morella), huckleberry, cranberry, cloudberry, sweetglale, alder, willow, birch, ash, dogwood, and a few others. I you assigned a code of 3 or higher to any of the first four choices and the ground cover beneath the trees/shrubs is <25% moss, then question F1 might be "B1". [CS, INV, NR, PH, POL, SBM, Sens]
		coniferous trees (may include tamarack) taller than 3 m. deciduous trees taller than 3 m.	2	3 1
		coniferous or ericaceous shrubs or trees 1-3 m tall not directly below the canopy of trees.	0	
		deciduous shrubs or trees 1-3 m tall not directly below the canopy of trees. coniferous or ericaceous shrubs <1 m tall not directly below the canopy of taller vegetation.	0	
		deciduous shrubs or trees <1 m tall (e.g., deciduous seedlings) not directly below the canopy of taller vegetation.	1	
ote :	If none of top 4 rows in	F3 was marked 2 or greater , SKIP to F9 (N fixers).		
	Dominance of Most	Determine which two woody plant species comprise the greatest portion of the low (<3 m) woody cover . Then choose one:		[PH, POL, SBM, Sens]
	Abundant Shrub Species	those species together comprise > 50% of such cover.	1	
1	Woody Diameter	those species together do not comprise > 50% of such cover. Mark ALL the types that comprise >5% of the woody canopy cover in the AA or >5% of the wooded areas (if any) along its upland edge	0	Estimate the diameters at chest height. If small-diameter trees are overlopped (shaded) by larger
	Classes	(perimeter). The edge should include only the trees whose canopies extend into the AA.		ones, visualise a "subcanopy" at the average height of the smaller-dbh trees, to serve as a basis for minimum 5% canopy requirement in this question. The trees and shrubs need not be wetland specie
		coniferous, 1-9 cm diameter and >1 m tall. broad-leaved deciduous 1-9 cm diameter and >1 m tall.	1	minimum 5% canopy requirement in this question. The flees and stituds need not be welland specie [AM, CS, POL, SBM, Sens, WBN]
		coniferous, 10-19 cm diameter.	1	
		broad-leaved deciduous 10-19 cm diameter.	1	
		coniferous, 20-40 cm diameter. broad-leaved deciduous 20-40 cm diameter.	0	
		coniferous, >40 cm diameter.	0	
		broad-leaved deciduous >40 cm diameter.	0	
		Follow the key below and mark the ONE row that best describes MOST of the AA:		[AM, INV, NR, PH, SBM, Sens]
6	Height Class Interspersion	A. Neither the vegetation taller than 1 m nor the vegetation shorter than that comprise >70% of the vegetated part of the AA. They each comprise 30-70%. Choose between A1 and A2 and mark the choice with a 1 in the adjoining column. Otherwise go to B below.

FieldF form - Non-tidal Page 3 of 5

F37	Interspersion of	During most of the part of the growing season when water is present, the spatial pattern of emergent vegetation within the water is mostly:		[AM, FA, FR, INV, NR, OE, PH, PR, SBM, SR, WBF, WBN]
	Emergents & Open Water	Scattered. More than 30% of such vegetation forms small islands or corridors surrounded by water.	0	
	water	Intermediate.	0	
		Clumped. More than 70% of such vegetation is in bands along the wetland perimeter or is clumped at one or a few sides of the surface water area.	0	
F38	Persistent Deepwater	If the deepest patch of surface water (flowing or ponded) in or directly adjacent to the AA is mostly deeper than 0.5 m for >2 weeks during the	0	
F39	Area Non-vegetated Aquatic	growing season, enter "1" and continue. If not, enter "0" and SKIP to F42.(Connection). During most of the growing season and in waters deeper than 0.5 m, the cover for fish, aquatic invertebrates, and/or amphibians that is		For this question, consider only the wood that is at or above the water surface. Estimates of underwater
	Cover	provided NOT by living vegetation, but by accumulations of dead wood and undercut banks is:		wood based only on observations from terrestrial viewpoints are unreliable so should not be attempted. [AM, FA, FR, INV]
		Little or none. Intermediate.	0	[Paul, I.A., I.K., III49]
		Extensive.	0	Supra .
F40	Isolated Island	The AA contains (or is part of) an island or beaver lodge within a lake, pond, or river, and is isolated from the shore by water depths > 1 m on all sides during an average June. The island may be solid, or it may be a floating vegetation mat that is sufficiently large and dense to support a waterbird nest.	0	[WBN]
F41	Duckweed	At some time of the year, mats of algae and/or duckweed are likely to cover >50% of the AA's otherwise-unshaded water surface, or blanket >50% of the underwater substrate. If true, enter "1" in next column. If untrue or uncertain, enter "0".	0	[EC, PR, WBF]
F42	Channel Connection & Outflow Duration	The most persistent surface water connection (outlet channel or pipe, ditch, or overbank water exchange) between the AA and a downslope stream network is: [Note: If the AA represents only part of a welland, answer this according to whichever is the least permanent surface connection: the one between the AA and the rest of the wetland, or the surface connection between the wetland and the downslope stream network.] Persistent (surface water flows out for >9 months/year).	0	Consider the connection regardless of whether the surface water is frozen. The "downslope stream network" could consist of ditches, rivers, ponds, or lakes which eventually connect to the ocean. If this cannot be determined while visiting the AA, consult topographic maps perhaps by viewing these online with Toporama (http://atlas.nrcan.gc.ca/toporama/en/index.html) [CS, FA, FR, NR, OE, PR, Sens, SFS SR, WCv, WS]
		Seasonal (surface water flows out for 14 days to 9 months/year, not necessarily consecutive).	1	
		Temporary (surface water flows out for <14 days, not necessarily consecutive). None but maps show a stream network downslope from the AA and within a distance that is less than the AA's length. SKIP to F47 (pH	0	
		Measurement).		
		No surface water flows out of the wetland except possibly during extreme events (<once (ph="" 10="" a="" an="" ditch,="" f47="" flows="" into="" lacks="" lake="" measurement).<="" only="" or="" or,="" outlet.="" per="" skip="" td="" that="" to="" water="" wetland,="" years).=""><td>0</td><td></td></once>	0	
F43	Outflow Confinement	During major runoff events, in the places where surface water exits the AA or connected waters nearby, the water:		"Major runoff events" would include biennial high water caused by storms and/or rapid snowmelt. [CS, NR, OE, PR, Sens, SR, STR, WS]
		Mostly passes through a pipe, culvert, narrowly breached dike, berm, beaver dam, or other partial obstruction (other than natural topography) that does not appear to drain the wetland artificially during most of the growing season.	1	
		Leaves through natural exits (channels or diffuse outflow), not mainly through artificial or temporary features. Is exported more quickly than usual due to ditches or pipes within the AA or connected to its outlet, or within 10 m of the AA's edge, which	0	
F44	T-th-st ChI	is exponent note quoty man usual out or unlines on piese within the AA or commence on its course, or within 10 into the AA seage, which drain the welland artificially, or water is pumped out of the AA. At least once annually, surface water from a tributary channel that is >100 m long moves into the AA. Or, surface water from a larger	U	If inlet tributaries cannot be searched for due to inaccessibility of part of the AA, follow suggestions in
	,	permanent water body adjacent to the AA spills into the AA. If it enters only via a pipe, that pipe must be fed by a mapped stream or lake further upslope. If no, SKIP to F47 (pH Measurement).	0	F42 above. [NRv, PH, PRv, SRv]
F45	Input Water Temperature	Based on lack of shade, water source characteristics, or actual temperature measurements, the inflow is likely to be warmer than surface water in the AA during part of most years. Enter 1= yes, 0= no.	0	[WCv]
F46	Throughflow Resistance	During its travel through the AA at the time of peak annual flow, water arriving in channels: [select only the ONE encountered by most of the incoming water].		[FA, FR, INV, NR, OE, PR, SR, WS]
	Resistance	Does not bump into many plant stems as it travels through the AA. Nearly all the water continues to travel in unvegetated (often incised) channels that have minimal contact with wetland vegetation, or through a zone of open water such as an instream pond or lake.	0	
		Bumps into herbaceous vegetation but mostly remains in fairly straight channels.	1	
		Bumps into neroaceous vegetation but mostly remains in rarry straight channels. Bumps into herbaceous vegetation and mostly spreads throughout, or is in widely meandering, multi-branched, or braided channels.	0	
		Bumps into tree trunks and/or shrub stems but mostly remains in fairly straight channels.	0	
		Bumps into tree trunks and/or shrub stems and follows a fairly indirect path from entrance to exit (meandering, multi-branched, or braided).	0	
F47	pH Measurement	The pH in most of the AA's surface water:		Preferably, measure this in larger areas of ponded surface water within the AA, or in streams that have
		Was measured, and is: [enter the reading in the column to the right.]		passed through (not along) most of the AA. Unless surface water is completely absent, do not dig holes or make depressions in peat in order to provide water for this measurement. Avoid measuring near
		Was not measured but surface water is present and is darkly tea-coloured. Or if no surface water, then mosses and plants that indicate peatland (e.g., Labrador tea) are prevalent. Enter "1".	0	roads or in puddles formed only by recent rain. [AM, FA, FR, NR, WBF, PH, PR, Sens, WBF, WBN]
F48	TDS and/or	Neither of above. Enter "1". The TDS (total dissolved solids) or conductivity off the AA's surface water is: (select the first true row with information):	1	See above for measurement guidance. [FR, INV, NRv, PH, PRv, Sens]
	Conductivity	TDS is: [Enter the reading in ppm or mg/L in the column to the right, if measured, or answer next row.]		
		Conductivity is [Enter the reading in µSicm in the column to the right.] Was not measured, but plants that indicate saline conditions cover much of the vegetated AA. Enter "1".	0	
		Was not measured, but plants that indicate saline conditions cover much or the vegetated AAL criter 1. Neither of above	1	
F49	Beaver Probability	Use of the AA by beaver during the past 5 years is (select most applicable ONE):		[FA, FR, PH, SBM, Sens, WBF, WBN]
		Evident from direct observation or presence of gnawed limbs, dams, tracks, dens, lodges, or extensive stands of water-killed trees (snags).	0	
		Likely based on known occurrence in the region and proximity to suitable habitat, which may include: (a) a persistent freshwater wetland, pond, or lake, or a perennial low or mild-gradient (<10%) channel, and (b) a corridor or multiple stands of hardwood trees and shrubs in vegetated areas near surface water.	0	
		Unlikely because site characteristics above are deficient, and/or this is a settled area or other area where beaver are routinely removed.	1	
F50	Groundwater Strength of Evidence	Select first applicable choice: Springs are known to be present within the AA, or if groundwater levels have been monitored, that has demonstrated that groundwater	0	Adhere to these criteria strictly do not use personal judgment based on fen conditions, pH, or other evidence. Consult topographic maps to detect breaks in slope described here. Rust deposits
		primarily discharges to the wetland for longer periods during the year than periods when the wetland recharges the groundwater.	0	associated with groundwater seeps may be most noticeable as orange discoloration in ice formations along streams during early winter. [AM, CS, FA, FR, INV, NR, OE, PH, PRv, SFS, WC, WS]
		Most of the AA has a slope of 5-5%, or is very close to the base of a natural slope longer than 100 and much steeper than the slope of the AA, AND the pH of surface water, if known, is > 5.5. Neither of above is true, although some groundwater may discharge to or flow through the AA. Or groundwater influx is unknown.	0	
F51	Internal Gradient	Neither of above is true, although some groundwater may discharge to or flow through the AA. Or groundwater influx is unknown. The gradient along most of the flow path within the AA is:	1	This is not the same as the shoreline slope. It is the elevational difference between the AA's inlet and
		<2% or the AA has no surface water outlet (not even seasonally).	1	outlet, divided by the flow-distance between them and converted to percent. If available, use a clinometer to measure this. Free clinometer apps can be downloaded to smartphones. If the wetland is
		2-5%. 6-10%.	0	large (longer than -1 km), this may be estimated using Google Earth to determine the minimum and
		6-10%.	0	maximum elevation within the AA, then dividing by length and multiplying by 100. [CS, NR, OE, PR, SR, WBF, WBN, WS]
		ions: If the AA lacks an upland edge, evaluate based on the AA's entire perimeter, and moving outward into whatever areas are nese questions are best answered by measuring from aerial images.		
F52	Vegetated Buffer as %	Within a zone extending 30 m laterally from the AA's edge with upland and/or other wetlands, the percentage that contains perennial		[AM, FA, FR, INV, NRv, PH, POL, PRv, SBM, Sens, SRv, STR, WBN]
