How many wetlands have you assessed previously using WESP-AC? (approx.)	15
Comments about the site or this WESP-AC assessment (attach extra page if desired):	

Form OF (Office). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Conduct an assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answering many of the questions below will require using these online map viewers:

Google Earth Pro: https://www.google.com/earth/download/gep/agree.html

GeoNB: http://www.snb.ca/geonb1/ and http://www.snb.ca/geonb1/e/apps/apps-E.asp

	Indicators	Condition Choices	Data	Definitions/Explanations
F1	Province	Mark the province in which the AA is located by changing the 0 in the column next to it to a *1". Mark only one.		This determines to which province's calibration wetlands the raw score of any wetland is normalise
		New Brunswick	1	In the function and benefits models, it also triggers the automatic exclusion of indicators for which spatial data exists in a particular province.
		Nova Scotia	0	spatial data exists in a particular province.
		Prince Edward Island	0	
		Newfoundland-Labrador	0	
2	Ponded Area Within 1 km.	The area of surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) within 1 km is:		"Adjacent" means not separated from the AA by a wide expanse (>50 m) of upland (including rox >50 m wide). Include ponded areas likely to be hidden by wetland vegetation. If surface water
		<0.01 hectare (about 10 m x 10 m).	1	extends beyond 1 km, include only the part within 1 km. Do not include tidal areas. Measure the
		0.01 - 0.1 hectare.	0	from aerial imagery using Google Earth Pro (click on Ruler icon in toolbar, then Polygon in pop-up
		0.1 - 1 hectare.	0	menu). With the GeoNB viewer, enable the Wetlands layer, then measure with the Draw & Measi tool after specifying Aerial as the Basemap. However, do not rely entirely on wetland boundaries
		1 to 10 hectares.	0	shown in online wetlands layers. [PH, SBM, WBN]
		10 to 100 hectares.	0	,
		>100 hectares.	0	
3	Ponded Water & Wetland Within 1 km.	The area of wetlands and surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) within is:	n	See definition of adjacent in OF2. If the AA's wetland vegetation extends beyond 1 km, include o the part within 1 km. "Ponded" means not flowing in rivers or streams. [Sens, WBF]
		<0.01 hectare (about 10 m x 10 m).	0	
		0.01 - 0.1 hectare.	0	
		0.1 - 1 hectare.	0	
		1 to 10 hectares.	- 1	
		10 to 100 hectares.	0	
		>100 hectares.	0	
4	Size of Largest Nearby Vegetated Tract or	The largest vegetated patch or corridor that includes the AA's vegetation plus aladjacent upland vegetation that is not lawn, row crops, heavily grazed lands, conifer plantation is:		See definition of adjacent in OF2. Use Google Earth Pro's polygon ruler (as described above). Exclude conifer plantations only if it is obvious that trees were planted in rows. [AM, PH, SBM, Se
	Corridor	<0.01 hectare (about 10 m x 10 m).	0	
		0.01 - 0.1 hectare.	0	1
		0.1 - 1 hectare.	0	1
		1 to 10 hectares.	0	1
		10 to 100 hectares.	0	1
		100 to 1000 hectares.	0	1
		>1000 hectares. [This is nearly always the answer in relatively undeveloped landscapes]	1	
5	Distance to Large Vegetated Tract	The minimum distance from the edge of the AA to the edge of the closest vegetated land (but excluding row crops, lawn, conifer plantation) targer than 375 hectares (about 2 km on a side), is:		To measure distance, use Google Earth Pro (Ruler > Line tool). Or use Draw & Measure tool at GeoNB. The 375-ha criterion is from the Fundy Model Forest Project. [AM, PH, POL, SBM, Sen:
		450 m, and not separated from the 375-ha vegetated area by any width opaved roads, stretches of open water, row crops, bare ground, lawn, or impervious surface. Or the AA itself contains >375 ha of vegetation. [This is often the answer in relatively undeveloped landscaped.]	1 95.]	
		<50 m, but completely separated from the 375-ha vegetated area by those features, and AA does not contain >375 ha of vegetation.	0	
		50-500 m, and not separated.	0	1
		50-500 m, but separated by those features.	0	1
		0.5 - 5 km, and not separated.	0	
		0.5 - 5 km, but separated by those features.	0	1
		None of the above (the closest patches or corridors which are that large are >5 km away).	0	
6	Herbaceous Uniqueness	The AA's vegetation cover is >10% herbaceous* but uplands within 5 km have <10% herbaceous cover. If so, enter "3" and continue to OF7. If not, consider: The AA's vegetation cover is >10% herbaceous* but uplands within 1 km have <10% herbaceous cover. If so enter "2" and continue to OF7. If not, consider: The AA's vegetation cover is >10% herbaceous* but uplands within 100 m of the wetland edge have <10% herbaceous cover. If so, enter "1". "NOTE: Exclude lawns, row crops, heavily grazed lands, forest, shrublands. Include moss as well as grasslike plants in this use of herbaceous vegetation"]	0	For this question only, consider moss to be herbaceous vegetation. Determine the score by view areal imagery in Google Earth after successively drawing or estimating the boundaries of the bu of 5 km, 1 km, and 100 m radius focused on the center of the AA. Circles of specified radius can drawn in Google Earth Pro by clicking on the Ruler icon, then Circle in the pop-up menu. [AMV, I POLV, SBMV, WBFV, WBNV]
7	Woody Uniqueness	The AA's vegetation cover is >10% woody* but uplands within 5 km have <10% woody cover. If so, enter "3" and continue to OF8. If not,	0	See above. Do not consider conifer plantations to be forest if it is obvious that trees were planted
		consider: The AA's vegetation is >10% woody" but uplands within 1 km have <10% woody cover. If so enter "2" and continue to OF8. If not, consider:		rows. [AMv, PHv, POLv, SBMv]
		The AAT's vegetation is >10% woody* but uplands within 100 m of the wetland edge have <10% woody cover. If so, enter "1" [" NOTE: woody cover = trees & shrubs taller than 1 m.]		
	Local Vegetated Cover	Draw a 5-km radius circle measured from the center of the AA. Ignoring all permanent water in the circle, the percent of the remaining are that is wooded or unmanaged herbaceous vegetation (NOT lawn, row crops, bare or heavily grazed land, clearcuts, or conifer plantations)		In Google Earth, draw the 5 km buffer and then estimate land cover percentages, or do GIS anal of an appropriate land cover layer. [AM, PH, POL, SBM, Sens]

Divide the area of the wetland (not just the AA) by the approximate area of its catchment excluding the area of the wetland itself. When doing the calculation, if ponded water is adjacent to the wetland, include that in the wetland area. The result is: -0.01, or catchment size unknown due to stormwater pipes that collect water from an indeterminate area. -0.01 to 0.1. -1 to 1. -1 (wetland is larger than its catchment (e.g., wetland with flat surrounding terrain and no inlet, or is entirely isolated by dikes, or is a raise tog).	0 0 0 1 1 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	Topographic maps may be viewed online at the National Atlas of Canada (Toporama): http://atlas.gc.ca/loporama/en/index.html [NR, PR, Sens, SR, WS]
DF22 VCCCCC	Oownstream Wetland as a % of its Contributing Area	waters. Data are insufficient (no or inadequate sampling within 1 km, or condition exists only at >1 km upstream)This is the situation for nearly all wetlands in this region. The problem described above is downslope from the AA, and: The condition is present within 1 km downslope and connected to the AA by a channel. The condition is present within 5 km downslope and connected to the AA by a channel, or within 1 km but not connected to the AA by a channel. Sampling during both low water periods and times with high runoff (storms, snowmelt) indicates no problems in either the AA or inflowing waters. Sampling during both low water periods and times with high runoff (storms, snowmelt) indicates no problems in either the AA or inflowing waters. Data are insufficient (no or inadequate sampling within 1 km, or condition exists only at >1 km upstream)This is the situation for nearly all wetlands in this region. From a topographic map and field observations, estimate the approximate boundaries of the catchment (CA) of the entire wetland of which he AA may be only a part. Then adjust those boundaries if necessary based on your field observations of the surrounding terrain, and/or tusing procedures described in the Manual. Divide the area of the wetland (not just the AA) by the approximate area of its catchment excluding the area of the wetland itself. When doing the calculation, if ponded water is adjacent to the wetland, include that in the wetland area. The result is: -0.01 to 0.1. 0.1 to 0.1. 1.1 (wetland is larger than its catchment (e.g., wetland with flat surrounding terrain and no inlet, or is entirely isolated by dikes, or is a raise loog). The proportion of the AA's contributing area (measured to no more than 1000 m upslope) that is comprised of buildings, roads, parking lot other pavement, exposed bedrock, landslides, and other mostly-bare surface is about:	0 0 0 1 1 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	Topographic maps may be viewed online at the National Atlas of Canada (Toporama):

Form F (Field). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Walk for no less than 10 minutes from the wetland edge towards its core, in the part of the AA that is proposed for alteration. If no alteration is proposed, walk in a portion that appears to be most representative of the wetland overall. Walk only where it is safe and legal to do so. Conduct the assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answer these questions primarily based on your onsite observations and interpretations. Do not write in shaded parts of this data form. Answering some questions accurately may require conferring with the landowner or other knowledgable persons and/or reviewing aerial imagery. For most wetlands, completing this field data form will require 1-2 hours on a site. For a list of functions to which each question pertains, see the accompanying Interpretations form. For detailed descriptions of each WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage & Delay, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity, STR= Stressors.

	1- 11 -		F :	
#	Indicators	Condition Choices	Data	Definitions/Explanations
1	Wetland Type	Follow the key below and mark the ONE row that best describes MOST of the vegetated part of the AA:		Ericaceous shrubs are ones in the heather family (Ericaceae). Most have leathery evergreen leaves. They include rhododendron, azalea, swamp laurel, leatherleaf, Labrador tea, and others. Most require
		A. Moss and/or lichen cover more than 25% of the ground. Often dominated by ericaceous shrubs (e.g., Labrador tea) or other acid-tolerant plants (e.g., bog cranberry, pitcher plant, sundew, orchids). Substrate is mostly undecomposed peat. Choose between A1 and A2 and mark the choice with a 1 in their adjoining column. Otherwise go to B below.		acidic soil. Although not in the family Ericaceae, sweetgale (<i>Myrica gale</i>) should be counted also. [AM, CS, FA, FR, INV, NR, OE, PH, Sens, SFS, WBF, WBN]
		A1. Surface water is usually absent or, if present, pH is typically <4.5 and conductivity is usually <100 µS/cm (<64 ppm TDS). Trees are absent or nearly so. Sedge cover usually sparse or absent but cottongrass and/or lichen cover may be extensive, as well as cloudberry, lingonberry, sheep laurel, and a sedge (Carex rariflora). Welland surface and surrounding landscape are seldom sloping and welland often is domed (convex). Inlet and outlet channels are usually absent. If known, pH of peat is <4.0.	0	
		A2. Not A1. Surface water, if present, has pH typically >4.5 and conductivity is usually >100 µS/cm (>64 ppm TDS). Sedge cover is usually extensive, and/or free and tall shrub cover is extensive. Sometimes at toe of slope or edge of water body. An exit channel is usually present. Wetter than A1 and peat depth may be shallower (<2 m).	0	
		B. Moss and/or lichen cover less than 25% of the ground. Soil is mineral or decomposed organic (muck). Choose between B1 and B2 and mark the choice with a 1 in their adjoining column:		
		B1. Trees and shrubs taller than 1 m comprise more than 25% of the vegetated cover. Surface water is mostly absent or inundates the vegetation only seasonally (e.g., vernal pools or floodplain).	1	
		B2. Not B1. Tree & tall shrubs comprise less than than 25% of the vegetated cover. Vegetation is mostly herbaceous, e.g., cattail, bufush, burreed, pond lily, horsetail. Surface water may be extensive and fluctuates seasonally, being either persistent or drying up partly or entirely.	0	
AA sh nclud ' adja lescn	ould also include part of i e the open water part adj cent " is used synonymoo bed features along their i	he AA should include all persistent waters in ponds smaller than 8 hectares (-283 m on a side) that are adjacent to the AA. The the water area of adjacent ponded water larger than 8 ha and adjacent rivers wider than 20 m. Specifically, the AA should iscent to wetland vegetation and equal in width to the average width of that vegetated zone. Throughout this dat form, usly with abutting, adjoining, bordering, contiguous and means no upland (manmade or natural) completely separates the directly shared edge. Features joined only by a channel are not necessarily considered to be adjacent a large portion of their es do not have to be hydrologically connected in order to be considered adjacent.		
2	Wetland Types - Adjoining or Subordinate	If the AA is smaller than 1 ha, mark all other types that occupy more than 1% of the vegetated AA. If the AA is larger than 1 ha, mark all other types which are within or adjacent to the AA and occupy more than 1 ha, as visible from the AA or as interpreted from aerial imagery. Do not mark again the type marked in F1.		1 hectare is 10,000 sq. m or about 2.5 acres. It could have dimensions of 100 m by 100 m, 1000 m by 10 m, or similar. [AM, INV, SBM, WBF]
		A1. A2.	0	
		B1.	0	
2	Woody Height & Form	B2. Following EACH row below, indicate with a number code the percentage of the living vegetation in the AA which is occupied by that feature (6	0	Deciduous shrubs in this region usually include buttonbush, Labrador tea, bayberry (Morella),
3	Diversity	if >95%, 5 if 75-95%, 4 if 50-75%, 3 if 25-50%, 2 if 5-25%, 1 if <5%, 0 if none). If the vegetated part of the AA is largely herbaceous (non-woody) vegetation, these percentages should not sum to 100%.		Decladous stricts in this region losality include distinctions, Labriator lea, adjusting (worked), huckleberry, cranberry, cloudberry, sweetgale, alder, willow, birch, ash, dogwood, and a few others. If you assigned a code of 3 or higher to any of the first four choices and the ground cover beneath the threes/shrubs is <25% moss, then question F1 might be "B1". [CS, INV, NR, PH, POL, SBM, Sens]
		coniferous trees (may include tamarack) taller than 3 m. deciduous trees taller than 3 m.	2	
		coniferous or ericaceous shrubs or trees 1-3 m tall not directly below the canopy of trees.	3	
		deciduous shrubs or trees 1-3 m tall not directly below the canopy of trees. coniferous or ericaceous shrubs <1 m tall not directly below the canopy of taller vegetation.	2	
		deciduous shrubs or trees <1 m tall (e.g., deciduous seedlings) not directly below the canopy of taller vegetation.	2	
lote :	If none of top 4 rows in	F3 was marked 2 or greater , SKIP to F9 (N fixers).		
4	Dominance of Most Abundant Shrub	Determine which two woody plant species comprise the greatest portion of the low (<3 m) woody cover . Then choose one:		[PH, POL, SBM, Sens]
	Species Species	those species together comprise > 50% of such cover. those species together do not comprise > 50% of such cover.	0	
5	Woody Diameter Classes	mass species together do not comprise > 3 or 3	0	Estimate the diameters at chest height. If small-diameter trees are overtopped (shaded) by larger ones, visualise a "subcanopy" at the average height of the smaller-dbh trees, to serve as a basis for t
		coniferous, 1-9 cm diameter and >1 m tall.	1	minimum 5% canopy requirement in this question. The trees and shrubs need not be wetland specie [AM, CS, POL, SBM, Sens, WBN]
		broad-leaved deciduous 1-9 cm diameter and >1 m tall. coniferous, 10-19 cm diameter.	1	pun, oo, i oe, oon, oon, iion,
		broad-leaved deciduous 10-19 cm diameter.	1	
		coniferous, 20-40 cm diameter.	1	
		broad-leaved deciduous 20-40 cm diameter. coniferous, >40 cm diameter.	1	
		broad-leaved deciduous >40 cm diameter.	1	
5	Height Class Interspersion	Follow the key below and mark the ONE row that best describes MOST of the AA: A. Neither the vegetation taller than 1 m nor the vegetation shorter than that comprise >70% of the vegetated part of the AA. They each comprise 30-70%. Choose between A1 and A2 and mark the choice with a 1 in the adjoining column. Otherwise go to B below.		[AM, INV, NR, PH, SBM, Sens]
		A1. The two height classes are mostly scattered and intermixed throughout the AA.	1	
		A2. Not A1. The two height classes are mostly in separate zones or bands, or in proportionately large clumps.	0	
			0	
		A2. Not A1. The two height classes are mostly in separate zones or bands, or in proportionately large clumps. B. Either the vegetation shorter than 1 m comprises >70% of the vegetated part of the AA, or the vegetation taller than that does. One size	0 0	
7	Large Snags (Dead	A2. Not A1. The two height classes are mostly in separate zones or bands, or in proportionately large clumps. B. Either the vegetation shorter than 1 m comprises >70% of the vegetated part of the AA, or the vegetation taller than that does. One size class might even be totally absent. Choose between B1 and B2 and mark the choice with a 1 in the adjoining column: B1. The less prevalent height class is mostly scattered and intermixed within the prevalent one.	0	
7	Large Snags (Dead Standing Trees)	A2. Not A1. The two height classes are mostly in separate zones or bands, or in proportionately large clumps. B. Either the vegetation shorter than 1 m comprises > 70% of the vegetated part of the AA, or the vegetation taller than that does. One size class might even be totally absent. Choose between B1 and B2 and mark the choice with a1 in the adjoining column: B1. The less prevalent height class is mostly scattered and intermixed within the prevalent one. B2. Not B1. The less prevalent height class is mostly located apart from the prevalent one, in separate zones or clumps, or is completely absent. The number of large snags (diameter >20 cm) in the AA plus adjacent upland area within 10 m of the wetland edge is: None, or fewer than 8/ hectare which exceed this diameter.	0 0	Snags are dead standing trees that often (not always) lack bark and foliage. Include only ones that a at least 2 m tall. [POL, SBM, WBN]
7		A2. Not A1. The two height classes are mostly in separate zones or bands, or in proportionately large clumps. B. Either the vegetation shorter than 1 m comprises > 70% of the vegetated part of the AA, or the vegetation taller than that does. One size class might even be totally absent. Choose between B1 and B2 and mark the choice with a 1 in the adjoining column: B1. The less prevalent height class is mostly scattered and intermixed within the prevalent one. B2. Not B1. The less prevalent height class is mostly located apart from the prevalent one, in separate zones or clumps, or is completely—absent. The number of large snags (diameter >20 cm) in the AA plus adjacent upland area within 10 m of the wetland edge is: None, or fewer than 8/ hectare which exceed this diameter. Several (>8/hectare) and a pond, lake, or slow-flowing water wider than 10 m is within 1 km.	0	
7		A2. Not A1. The two height classes are mostly in separate zones or bands, or in proportionately large clumps. B. Either the vegetation shorter than 1 m comprises > 70% of the vegetated part of the AA, or the vegetation taller than that does. One size class might even be totally absent. Choose between B1 and B2 and mark the choice with a1 in the adjoining column: B1. The less prevalent height class is mostly scattered and intermixed within the prevalent one. B2. Not B1. The less prevalent height class is mostly located apart from the prevalent one, in separate zones or clumps, or is completely absent. The number of large snags (diameter >20 cm) in the AA plus adjacent upland area within 10 m of the wetland edge is: None, or fewer than 8/ hectare which exceed this diameter.	0 0	
7	Standing Trees)	A2. Not A1. The two height classes are mostly in separate zones or bands, or in proportionately large clumps. B. Either the vegetation shorter than 1 m comprises > 70% of the vegetated part of the AA, or the vegetation taller than that does. One size class might even be lotally absent. Choose between B1 and B2 and mark the choice with a 1 in the adjoining column: B1. The less prevalent height class is mostly scattered and intermixed within the prevalent one. B2. Not B1. The less prevalent height class is mostly located apart from the prevalent one, in separate zones or clumps, or is completely absent. The number of large snags (diameter >20 cm) in the AA plus adjacent upland area within 10 m of the wetland edge is: None, or fewer than 8/ hectare which exceed this diameter. Several (>8/hectare) and a pond, lake, or slow-flowing water wider than 10 m is within 1 km. Several (>8/hectare) but above not true.	0 0	

FieldF form - Non-tidal Page 1 of 5

FQ	N Fixers	The percentage of the AA's vegetated cover that contains nitrogen-fixing plants (e.g., alder, sweetgale, clover, lupine, alfalfa, other legumes)		Do not include N-fixing algae or lichens. [FA, FR, INV, NRv, OE, PH, SBM, Sens]
1 7	IN FIXEIS	is:		DO NOT INCIDIDE INFINITY BIGGE OF INCIDENS. [F.A., F.K., INVV, INVV, OL., F.H., SDIW, SENS]
		<1% or none.	0	
		1-25% of the vegetated cover, in the AA or along its water edge (whichever has more).	1	
		25-50% of the vegetated cover, in the AA or along its water edge (whichever has more). 50-75% of the vegetated cover, in the AA or along its water edge (whichever has more).	0	
		>75% of the vegetated cover, in the AA or along its water edge (whichever has more).	0	
F10	Sphagnum Moss	The cover of Sphagnum moss (or any moss that forms a dense cushion many centimeters thick), including the moss obscured by taller		Exclude moss growing on trees and rocks. [CS, PH]
	Extent	sedges and other plants rooted in it, is:		
		<5% of the vegetated part of the AA.	0	
		5-25% of the vegetated part of the AA. 25-50% of the vegetated part of the AA.	0	
		50-95% of the vegetated part of the AA.	0	
		>95% of the vegetated part of the AA.	0	
F11	% Bare Ground &	Consider the parts of the AA that lack surface water at the driest time of the growing season. Viewed from directly above the ground layer, the		Thatch is dead plant material (stems, leaves) resting on the ground surface. Bare ground that is
	Thatch	predominant condition in those areas at that time is:		present under a tree or shrub canopy should be counted. Boulders count as bare ground. Wetlands with mineral soils and that are heavily shaded or are dominated by annual plant species tend to have
		Little or no (<5%) bare ground is visible between erect stems or under canopy anywhere in the vegetated AA. Ground is extensively blanketed by dense thatch, moss, lichens, graminoids with great stem densities, or plants with ground-hugging foliage.	1	more extensive areas that are bare during the early growing season. [AM, EC, INV, NR, OE, POL, PR, SBM, Sens]
		Slightly bare ground (5-20% bare between plants) is visible in places, but those areas comprise less than 5% of the unflooded parts of the AA.	0	
		Much bare ground (20-50% bare between plants) is visible in places, and those areas comprise more than 5% of the unflooded parts of the AA.	0	
		Other conditions.	0	
F10	Constant less entretts	Not applicable. Surface water (either open or obscured by emergent plants) covers all of the AA all the time.	0	The description of the second state of the SC IAM AND DISTRICT OF THE SECOND SE
F12	Ground Irregularity	Imagine the AA without any living vegetation. Excluding the portion of the AA that is always under water, the number of hummocks, small pits, raised mounds, animal burrows, ruts, guilles, natural levees, microdepressions, and other areas of peat or mineral soil that are raised or depressed >10 cm compared to most of the area within a few meters surrounding them is:		The depressions may be of human or natural origin. [AM, EC, INV, NR, PH, POL, PR, SBM, SR, WS]
		Few or none (minimal microtopography; <1% of the land has such features, or entire AA is always water-covered).	0	
		Intermediate.	0	
		Several (extensive micro-lopography).	1	
F13	Upland Inclusions	Within the AA, inclusions of upland are:		[AM, NR, SBM]
		Few or none.	1	
		Intermediate (1 - 10% of vegetated part of the AA).	0	
E4.	0.11.	Many (e.g., wetland-upland "mosaic", >10% of the vegetated AA).	0	focus of pulps of organics
F14	Soil Texture	In parts of the AA that lack persistent water, the texture of soil in the uppermost layer is mostly: [To determine this, use a trowel to check in at least 3 widely spaced locations, and use the soil texture key (in Appendix A of the Manual).]		[CS, NR, OE, PH, PR, Sens, SFS, WS]
		Loamy: soils that may contain a little fine grit and do not make a "ribbon" longer than 2 cm when moistened, rolled, squeezed, and extended	0	
		between thumb and forefinger.	Ů	
		Fines: includes silt, clay, silt, soils that make a ribbon longer than 2 cm when moistened, rolled, squeezed, and extended between thumb and	1	
		forefinger. Deep Peat, to 40 cm depth or greater.	0	
		Shallow Peat or organic <40 cm deep.	0	
		Coarse: includes sand, loamy sand, gravel, cobble, soils that do not make a ribbon when moistened, rolled, squeezed, and extended	0	
F4-	0	between thumb and forefinger.		
F15	Shorebird Feeding Habitats	During any 2 consecutive weeks of the growing season, the extent of mudflats, bare unshaded saturated areas not covered by thatch, and unshaded waters shallower than 6 cm is: [Include also any area that is adjacent to the AA.]		This addresses needs of many but not all migratory sandpipers, plovers, and related species. [WBF]
		None, or <100 sq. m.	1	
		100-1000 sq. m.	0	
		1000 – 10,000 sq. m.	0	
F4.6		>10,000 sq. m.	0	TAM MIDE MIDES
F16	Herbaceous % of Vegetated Wetland	In aerial ("ducks eye") view, the maximum annual cover of herbaceous vegetation (all non-woody plants except moss) is:		[AM, WBF, WBN]
		<5% of the vegetated part of the AA or <0.01 hectare (whichever is less). Mark "1" here and SKIP to F20 (Invasive Plant Cover). 5-25% of the vegetated part of the AA.	0	
		25-50% of the vegetated part of the AA.	0	
		50-95% of the vegetated part of the AA.	0	
		>95% of the vegetated part of the AA.	0	
F17	Forb Cover	Within parts of the AA having herbaceous cover (excluding SAV), the areal cover of forbs reaches an annual maximum of:		Forbs are flowering plants. Do not include grasses, sedges, cattail, other graminoids, ferns, horsetails,
		<5% of the herbaceous part of the AA.	1	or others that lack showy flowers. [POL]
		5-25% of the herbaceous part of the AA.	0	
		25-50% of the herbaceous part of the AA. 50-95% of the herbaceous part of the AA.	0	
		>95% of the herbaceous part of the AA.	0	
F18	Sedge Cover	Sedges (Carex spp.) and cottongrass (Eriophorum spp.) occupy:		[CS]
		<5% of the vegetated area, or none.	0	
		5-50% of the vegetated area.	1	
		50-95% of the vegetated area.	0	
		>95% of the vegetated area.	0	
F19	Dominance of Most	Determine which two herbaceous species comprise the greatest portion of the herbaceous cover (excluding mosses and floating-leaved aquatic plants). Then choose one of the following:		For this question, include ferns as well as graminoids and forbs. [EC, INV, PH, POL, Sens]
	Abundant Herbaceous Species	advault plants). Then choose one or the following: those species together comprise > 50% of the areal cover of herbaceous plants at any time during the year.	1	
		those species together do not comprise > 50% of the areal cover of herbaceous plants at any time during the year.	0	
F20	Invasive Plant Cover	How extensive is the cover of invasive plant species in the AA? For species, see Plants_invasive worksheet in the accompanying Supplinfo		[EC, PH, POL, Sens]
		file. Invasive species appear to be absent in the AA, or are present only in trace amount (a few individuals).	0	
		invasive species are present in more than trace amounts, but comprise <5% of herbaceous cover (or woody cover, if the invasives are	1	
		woody).		
		invasive species comprise 5-20% of the herb cover (or woody cover, if the invasives are woody).	0	
		invasive species comprise 20-50% of the herb cover (or woody cover, if the invasives are woody). invasive species comprise >50% of the herb cover (or woody cover, if the invasives are woody).	0	
F21	Invasive Cover Along	Along the wetland-upland boundary, the percent of the upland edge (within 3 m upslope from the wetland) that is occupied by invasive plant	3	If a plant cannot be identified to species (e.g., winter conditions) but its genus contains an exotic
	Upland Edge	species is:		species, assume the unidentified plant to also be exotic. If vegetation is so senesced that exotic
		none of the upland edge (invasives apparently absent), or AA has no upland edge.	0	species cannot be identified, answer "none". [PH, STR]
		some (but <5%) of the upland edge.	1	
		5-50% of the upland edge. most (>50%) of the upland edge.	0	
F22	Fringe Wetland	During most of the year, open water within or adjacent to the vegetated part of the wetland is much wider than the maximum width of the	0	[WBF, WBN, WCv]
		vegetated zone within the wetland. Enter "1" if true, "0" if false.		
F23	Lacustrine Wetland	The vegetated part of the AA is within or adjacent to a body of non-tidal standing open water whose size exceeds 8 hectares during most of	0	[FR, PR, PU, WBF, WBN]
		a normal year.		

FieldF form - Non-tidal Page 2 of 5

F24	% of AA Without	The percentage of the AA that never contains <u>surface</u> water during an average year (that is, except perhaps for a few hours after snowmell or		1 hectare is 10,000 sq. m or about 2.5 acres. It could have dimensions of 100 m by 100 m, 1000 m by
	Surface Water	rainstorms), but which is still a wetland, is: <1%. In other words, all or nearly all of the AA is covered by water permanently or at least seasonally.	0	10 m, or similar. [AM, FA, FR, INV, NR, PH, PR, SBM, Sens, SRv, WBF, WBN, WC]
		1-25% of the AA, or <1% but >0.01 ha never contains surface water.	0	
		25-50% of the AA never contains surface water.	0	1
		50-75% of the AA never contains surface water.	0	
		75-99% of the AA never contains surface water, or >99% AND there is at least one persistent water body larger than 1 ha in the AA.	0	
		99-100%. AND there is no persistent ponded water body larger than 1 ha within the AA. Enter *1* and SKIP to F42 (Channel Connection).	1	
F25	% of AA with Persistent Surface Water	Identify the parts of the AA that still contain surface water (flowing or ponded, open or hidden beneath vegetation) even during the driest times of a normal year, i.e., when the AA's surface water is at its lowest annual level. At that time, the percentage of the AA that still contains surface water is:		If you are unable to determine the condition at the driest time of year, ask the land owner or neighbors about it if possible. Indicators of persistence may include fish, some dragonflies, beaver, and muskrat. [AM, CS, FA, FR, INV, NR, POL, PR, SBM, WBF, WBN]
		None. The AA dries up completely (no water in channels either) or never has surface water during most years. SKIP to F27.	0	
		1-20% of the AA.	0	
		20-50% of the AA. 50-95% of the AA.	0	1
		>95% of the AA. True for many fringe wetlands.	0	1
F26	% of Summertime Water that Is Shaded	At mid-day during the warmest time of year, the area of surface water <u>within</u> the AA that is shaded by vegetation and other features that are <u>within</u> the AA at that time is:		[FA, WC]
		<5% of the water is shaded, or no surface water is present then.	0	
		5-25% of the water is shaded.	0	-
		25-50% of the water is shaded. 50-75% of the water is shaded.	0	1
		>75% of the water is shaded.	0	1
F27	% of AA that is	The percentage of the AA's area that is between the annual high water and the annual low water (surface water) is:		Flood marks (algal mats, adventitious roots, debris lines, ice scour, etc.) are often evident when not
	Flooded Only	None, or <0.01 hectare and <1% of the AA. SKIP to F29.	0	fully inundated. Also, such areas often have a larger proportion of upland and annual (vs. perennial) plant species. In riverine systems, the extent of this zone can be estimated by multiplying by 2 the
	Seasonally	1-20% of the AA, or <1% but >0.01 ha.	0	paint species. In riverine systems, the extent of this zone can be estimated by multiplying by 2 the bankful height and visualising where that would intercept the land along the river. [CS, FA, INV, NR,
		20-50% of the AA.	0	OE, PH, SR, WBF, WBN, WS]
		50-95% of the AA.	0	1
F28	Annual Water	The annual fluctuation in surface water level within most of the parts of the AA that contain surface water at least temporarily is:	J	Look for flood marks (see above). Because the annual range of water levels is difficult to estimate
	Fluctuation Range		0	without multiple visits, consider asking the land owner or neighbors about it. [AM, CS, INV, NR, OE, PH,
		<10 cm change (stable or nearly so). 10 cm - 50 cm change.	0	PR, SR, WBN, WS]
		0.5 - 1 m change.	0	1
		1-2 m change.	0	
		>2 m change.	0	
(Conne	ection).	d water smaller than 0.01 hectare (about 10m x 10m, or 1m x 100 m)? If so, enter "1" in column D and SKIP TO F42	0	
F29	Predominant Depth Class	During most of the time when surface water is present during the growing season, its depth, averaged over the entire inundated part of the AA, is:		If a boat is unavailable, estimate this by considering wetland size and local topography. Or if timing and safety allow, depths may be measured by drilling through winter ice. This question is asking about the
	Class	<10 cm deep (but >0).	0	spatial median depth that occurs during most of that time, even if inundation is only seasonal or
		10 - 50 cm deep.	0	temporary. If inundation in most but not all of the wetland is brief, the answer will be based on the depth
		0.5 - 1 m deep.	0	of the most persistently inundated part of the wetland. Include surface water in channels and ditches as well as ponded areas. [CS, FA, FR, INV, OE, PH, PR, Sens, SFS, SR, WBF, WBN, WC]
		1 - 2 m deep.	0	
F30	Depth Classes -	>2 m deep. True for many fringe wetlands. When present, surface water in most of the AA usually consists of (select one):	0	Estimate these proportions by considering the gradient and microtopography of the site. [FR, INV,
	Evenness of	<u> </u>	0	WBF, WBN]
	Proportions	One depth class that comprises >90% of the AA's inundated area (use the classes in the question above). One depth class that comprises 50-90% of the AA's inundated area.	0	1
		Neither of above. There are 3 or more depth classes and none occupy >50%.	0	1
F31	% of Water That Is Ponded (not Flowing)	During most times when surface water is present, the percentage that is (1) ponded (stagnant, or flows so slowly that fine sediment is not held in suspension) AND (2) is likely to be deeper than 0.5 m in some places, is:		Nearly all wellands with surface water have some ponded water. [AM, CS, INV, NR, OE, PR, Sens, SR, WBF, WBN, WC, WS]
		<5% of the water, or it occupies <100 sq.m cumulatively. Nearly all the surface water is flowing. SKIP to F34.	0	
		5-30% of the water.	0	-
		30-70% of the water. 70-95% of the water.	0	-
		>95% of the water.	0	1
F32	Ponded Open Water - Minimum Size	During most of the growing season, the largest patch of open water that is ponded and is in or bordering the AA is >0.01 hectare (about 10 m by 10 m) and mostly deeper than 0.5 m. If true enter "1" and continue, If false, enter "0" and SKIP to F41 (Floating Algae & Duckweed).	0	Open water is not obscured by vegetation in aerial ("duck's eye") view. It includes vegetation floating on the water surface or entirely submersed beneath it.
F33	% of Ponded Water that is Open	In ducks-eye aerial view, the percentage of the ponded water that is open (lacking emergent vegetation during most of the growing season, and unhidden by a forest or shrub canopy) is:		[AM, CS, FA, FR, INV, NR, OE, PR, SR, WBF, WBN, WC]
	асто Орен	None, or <1% of the AA and largest pool occupies <0.01 hectares. Enter "1" and SKIP to F41 (Floating Algae & Duckweed).	0	1
		1-4% of the ponded water. Enter *1* and SKIP to F41 (Floating Algae & Duckweed).	0]
		5-30% of the ponded water.	0	
		30-70% of the ponded water.	0	
		70-99% of the ponded water. 100% of the ponded water.	0	1
F2.4	Width of Vegetated	At the time during the growing season when the AA's water level is lowest, the average width of vegetated area in the AA that separates	Ť	"Vegetated area" does not include underwater or floating-leaved plants, i.e., aquatic bed. Width may
r 34				include wooded riparian areas if they have wetland soil or plant indicators. [AM, CS, NR, OE, PH, PR,
F34	Zone within Wetland	adjoining uplands from open water within the AA is:

FieldF form - Non-tidal Page 3 of 5

F37	Interspersion of	During most of the part of the growing season when water is present, the spatial pattern of emergent vegetation within the water is mostly:		[AM, FA, FR, INV, NR, OE, PH, PR, SBM, SR, WBF, WBN]
	Emergents & Open Water	Scattered. More than 30% of such vegetation forms small islands or corridors surrounded by water.	0	
	water	Intermediate.	0	
		Clumped. More than 70% of such vegetation is in bands along the wetland perimeter or is clumped at one or a few sides of the surface water area.	0	
F38	Persistent Deepwater	If the deepest patch of surface water (flowing or ponded) in or directly adjacent to the AA is mostly deeper than 0.5 m for >2 weeks during the	0	
F39	Area Non-vegetated Aquatic	growing season, enter "1" and continue. If not, enter "0" and SKIP to F42.(Connection). During most of the growing season and in waters deeper than 0.5 m, the cover for fish, aquatic invertebrates, and/or amphibians that is		For this question, consider only the wood that is at or above the water surface. Estimates of underwater
137	Cover Cover	provided NOT by living vegetation, but by accumulations of dead wood and undercut banks is:		wood based only on observations from terrestrial viewpoints are unreliable so should not be attempted.
		Little or none. Intermediate.	0	[AM, FA, FR, INV]
		Extensive.	0	
F40	Isolated Island	The AA contains (or is part of) an island or beaver lodge within a lake, pond, or river, and is isolated from the shore by water depths > 1 m on all sides during an average June. The island may be solid, or it may be a floating vegetation mat that is sufficiently large and dense to support a waterbird nest.	0	[WBN]
	Floating Algae & Duckweed	Al some time of the year, mats of algae and/or duckweed are likely to cover >50% of the AA's otherwise-unshaded water surface, or blankel >50% of the underwater substrate. If true, enter "1" in next column. If untrue or uncertain, enter "0".	0	[EC, PR, WBF]
F42	Channel Connection & Outflow Duration	The most persistent surface water connection (outlet channel or pipe, ditch, or overbank water exchange) between the AA and a downslope stream network is: [Note: If the AA represents only part of a welland, answer this according to whichever is the least permanent surface connection: the one between the AA and the rest of the wetland, or the surface connection between the wetland and the downslope stream network.] Persistent (surface water flows out for >9 months/year).	0	Consider the connection regardless of whether the surface water is frozen. The "downslope stream network" could consist of ditches, rivers, ponds, or lakes which eventually connect to the ocean. If this cannot be determined while visiting the AA, consult topographic maps perhaps by viewing these online with Toporama (http://atlas.nrcan.gc.ca/toporama/en/index.html) [CS, FA, FR, NR, OE, PR, Sens, SFS SR, WCV, WS]
		Seasonal (surface water flows out for 14 days to 9 months/year, not necessarily consecutive).	1	
		Temporary (surface water flows out for <14 days, not necessarily consecutive). None but maps show a stream network downslope from the AA and within a distance that is less than the AA's length. SKIP to F47 (pH	0	
		Measurement).		
		No surface water flows out of the wetland except possibly during extreme events (-once per 10 years). Or, water flows only into a wetland, ditch, or lake that lacks an outlet. SKIP to F47 (pH Measurement).	0	
F43	Outflow Confinement	During major runoff events, in the places where surface water exits the AA or connected waters nearby, the water:		"Major runoff events" would include biennial high water caused by storms and/or rapid snowmelt. [CS, NR, OE, PR, Sens, SR, STR, WS]
		Mostly passes through a pipe, culvert, narrowly breached dike, berm, beaver dam, or other partial obstruction (other than natural topography) that does not appear to drain the wetland artificially during most of the growing season.	0	
		Leaves through natural exits (channels or diffuse outflow), not mainly through artificial or temporary features.	1	
		Is exported more quickly than usual due to ditches or pipes within the AA or connected to its outlet, or within 10 m of the AA's edge, which drain the wetland artificially, or water is pumped out of the AA.	0	
F44	Tributary Channel	At least once annually, surface water from a tributary channel that is >100 m long moves into the AA. Or, surface water from a larger permanent water body adjacent to the AA spills into the AA. If it enters only via a pipe, that pipe must be fed by a mapped stream or lake further upslope. If no, SKIP to F47 (pH Measurement).	0	If inlet tributaries cannot be searched for due to inaccessibility of part of the AA, follow suggestions in F42 above. [NRv, PH, PRv, SRv]
F45	Input Water Temperature	Based on lack of shade, water source characteristics, or actual temperature measurements, the inflow is likely to be warmer than surface water in the AA during part of most years. Enter 1= yes, 0= no.	0	[WCv]
F46	Throughflow	During its travel through the AA at the time of peak annual flow, water arriving in channels: [select only the ONE encountered by most of the incoming water].		[FA, FR, INV, NR, OE, PR, SR, WS]
	Resistance	Does not bump into many plant stems as it travels through the AA. Nearly all the water continues to travel in unvegetated (often incised)	0	
		channels that have minimal contact with wetland vegetation, or through a zone of open water such as an instream pond or lake.		
		Bumps into herbaceous vegetation but mostly remains in fairly straight channels.	0	
		Bumps into herbaceous vegetation and mostly spreads throughout, or is in widely meandering, multi-branched, or braided channels.	0	
		Bumps into tree trunks and/or shrub stems but mostly remains in fairly straight channels. Bumps into tree trunks and/or shrub stems and follows a fairly indirect path from entrance to exit (meandering, multi-branched, or braided).	0	
F47	pH Measurement	The pH in most of the AA's surface water:		Preferably, measure this in larger areas of ponded surface water within the AA, or in streams that have passed through (not along) most of the AA. Unless surface water is completely absent, do not dig holes
		Was measured, and is: [enter the reading in the column to the right.] Was not measured but surface water is present and is darkly tea-coloured. Or if no surface water, then mosses and plants that indicate	0	or make depressions in peat in order to provide water for this measurement. Avoid measuring near
		peatland (e.g., Labrador tea) are prevalent. Enter "1".	0	roads or in puddles formed only by recent rain. [AM, FA, FR, NR, WBF, PH, PR, Sens, WBF, WBN]
F48	TDS and/or	Neither of above. Enter "1". The TDS (total dissolved solids) or conductivity off the AA's surface water is: (select the first true row with information):	1	See above for measurement guidance. [FR, INV, NRv, PH, PRv, Sens]
	Conductivity	TDS is: [Enter the reading in ppm or mg/L in the column to the right, if measured, or answer next row.]		
		Conductivity is [Enter the reading in µS/cm in the column to the right.] Was not measured, but plants that indicate saline conditions cover much of the vegetated AA. Enter "1".	0	
		Neither of above	1	
F49	Beaver Probability	Use of the AA by beaver during the past 5 years is (select most applicable ONE):		[FA, FR, PH, SBM, Sens, WBF, WBN]
		Evident from direct observation or presence of gnawed limbs, dams, tracks, dens, lodges, or extensive stands of water-killed trees (snags).	0	
		Likely based on known occurrence in the region and proximity to suitable habitat, which may include: (a) a persistent freshwater wetland, pond, or lake, or a perennial low or mid-gradient (<10%) channel, and (b) a corridor or multiple stands of hardwood trees and shrubs in vegetated areas near surface water.	0	
F50	Groundwater Strength	Unlikely because site characteristics above are deficient, and/or this is a settled area or other area where beaver are routinely removed. Select first applicable choice:	1	Adhere to these criteria strictly do not use personal judgment based on fen conditions, pH, or other
1 30	of Evidence	Select first applicable choice: Springs are known to be present within the AA, or if groundwater levels have been monitored, that has demonstrated that groundwater primarily discharges to the wetland for longer periods during the year than periods when the wetland recharges the groundwater.	0	Agnere to these criteria strictly - oo hot use personal judgment assed on ren conditions, pH, or other evidence. Consult lopographic maps to detect breaks in slope described here. Rust deposits associated with groundwater seeps may be most noticeable as orange discoloration in ice formations along streams during early winter. [AM, CS, FA, FR, INV, NR, OE, PH, PRv, SFS, WC, WS]
		Most of the AA has a slope of >5%, or is very close to the base of a natural slope longer than 100 and much steeper than the slope of the AA, AND the pH of surface water, If known, is >5.5.	0	
F51	Internal Gradient	Neither of above is true, although some groundwater may discharge to or flow through the AA. Or groundwater influx is unknown. The gradient along most of the flow path within the AA is:	1	This is not the same as the shoreline slope. It is the elevational difference between the AA's inlet and
		The gradient along most of the now pain within the AATS. The AA has no surface water outlet (not even seasonally).	1	outlet, divided by the flow-distance between them and converted to percent. If available, use a
		2-5%.	0	clinometer to measure this. Free clinometer apps can be downloaded to smartphones. If the wetland is large (longer than –1 km), this may be estimated using Google Earth to determine the minimum and
		6-10%. >10%.	0	maximum elevation within the AA, then dividing by length and multiplying by 100. [CS, NR, OE, PR, SR, WBF, WBN, WS]
		ions: If the AA lacks an upland edge, evaluate based on the AA's entire perimeter, and moving outward into whatever areas are		
adjace F52	nt. In many situations, the Vegetated Buffer as %	nese questions are best answered by measuring from aerial images. 53	Type of Cover in Buffer	Within 30 m upslope of where the wetland transitions to upland, the upland land cover that is NOT perennial vegetation is mostly (mark ONE):		[AM, FA, INV, NRv, PH, POL, SBM, STR, WBN]
	Type or devel in Buner	, , , , , , , , , , , , , , , , , , , ,		
		Impervious surface, e.g., paved road, parking lot, building, exposed rock.	0	
		Bare or nearly bare pervious surface or managed vegetation, e.g., lawn, row crops, unpaved road, dike, landslide.	0	
54	Buffer Slope	The steepest and/or most disturbed part of the upland area that is within 30 m of the wetland and occupies >10% of that upland area has a percent slope of:		[NRv, PRv, Sens, SRv]
		<1% (flat almost no noticeable slope) or all the area within 30 m of the AA edge is other wetlands. 2-5%.	0	
		5-30%.	0	-
		3-30%. >30%.	0	-
55	Cliffs or Steep Banks	In the AA or within 100 m, there are elevated terrestrial features such as cliffs, talus slopes, stream banks, or excavated pits (but not riprap)	0	Do not include upturned trees as potential den sites. [POL, SBM]
33	Cilis di Steep Banks	that extend at least 2 m nearly vertically, are unvegetated, and potentially contain crevices or other substrate suitable for nesting or den areas. Enter 1 (yes) or 0 (no).		portion mende dynamica arees as potential activistics. It OE, Solmj
56	New or Expanded Wetland	Human actions within or adjacent to the AA have persistently expanded a naturally occurring wetland or created a wetland where there previously was none (e.g., by excavation, impoundment):		Determine this using historical aerial photography, old maps, soil maps, or permit files as available [CS NR, OE, PH, Sens]
		No.	0	
		Yes, and created or expanded 20 - 100 years ago.	0	
		Yes, and created or expanded 3-20 years ago.	0	
		Yes, and created or expanded within last 3 years.	0	
		Yes, but time of origin or expansion unknown.	0	
		Unknown if new or expanded within 20 years or not.	1	
57	Burn History	More than 1% of the AA's previously vegetated area:		Look for charred soil or stumps (in multiple widely-spaced locations) or ask landowner. [CS, PH, STR]
		Burned within past 5 years.	0	-
		Burned 6-10 years ago.	0	-
		Burned 11-30 years ago.	0	
F0.	V (1-11-1114-)	Burned >30 years ago, or no evidence of a burn and no data.	1	[DL CTD WDF.]
58	Visibility	The maximum percentage of the wetland that is visible from the best vantage point on public roads, public parking lots, public buildings, or public maintained trails that intersect, adjoin, or are within 100 m of the AA (select one) is:		[PU, STR, WBFv]
		<25%.	0	
		25-50%.	0	
T0	M1	>50%.	1	[DLI CTD]
59	Non-consumptive Uses - Actual or	Assuming access permission was granted, select ALL statements that are true of the AA as it currently exists:		[PU, STR]
	Potential	For an average person, walking is physically possible in (not just near) >5% of the AA during most of the growing season, e.g., free of deep water and dense shrub thickets.	1	
		Maintained roads, parking areas, or foot-trails are within 10 m of the AA, or the AA can be accessed part of the year by boats arriving via contiguous waters.	1	
		Within or near the AA, there is an interpretive center, trails with interpretive signs or brochures, and/or regular guided interpretive tours.	0	
60	Unvisited Core Area	The percentage of the AA almost never visited by humans during an average growing season probably comprises: [Note: Only include the part actually walked or driven (not simply viewed from) with a vehicle or boat. Do not include visitors on trails outside of the AA unless more than half the wetland is visible from the trails and they are within 30 m of the wetland edge. In that case include only the area occupied by the trail.		[AM, FAv, FRv, PH, PU, SBM, STR, WBF, WBN]
		<5% and no inhabited building is within 100 m of the AA.	0	
		<5% and inhabited building is within 100 m of the AA.	0	
		5-50% and no inhabited building is within 100 m of the AA.	0	_
		5-50% and inhabited building is within 100 m of the AA.	0	
		50-95%, with or without inhabited building nearby.	0	
41	Eroguantly Violtad	>95% of the AA with or without inhabited building nearby.	1	TAM DIL DIL COM CTD WIDE WIDNI
61	Frequently Visited Area	The part of the AA visited by humans almost daily for several weeks during an average growing season probably comprises: [See note above.]		[AM, PH, PU, SBM, STR, WBF, WBN]
		<5%. If F60 was answered ">95%" (mostly never visited), SKIP to F64.	1	
		5-50%.	0	
		50-95%. >95% of the AA.	0	
62	BMP - Soils	>>>s of the AA. Boardwalks, paved trails, fences or other infrastructure and/or well-enforced regulations appear to effectively prevent visitors from walking on soil within nearly all of the AA when the soil is unfrozen. Enter "1" if true.	0	[PH, PU]
63	BMP - Wildlife Protection	Fences, observation blinds, platforms, paved traits, exclusion periods, and/or well-enforced prohibitions on motorised boats, off-leash pets, and off road vehicles appear to effectively exclude or divert visitors and their pets from the AA at critical times in order to minimize disturbance of wildlife (except during hunting seasons). Enter *1* if true.	0	[AM, PU, WBF, WBN]
64	Consumptive Uses	Recent evidence was found within the AA of the following potentially-sustainable consumptive uses. Select ALL that apply.		[FAv, FRv, WBFv]
	(Provisioning Services)	Low-impact commercial timber harvest (e.g., selective thinning).	0	1
		Commercial or traditional-use harvesting of native plants, their fruits, or mushrooms.	0	1
		Waterfowl hunting.	0	1
		Fishing.	0	1
		Trapping of furbearers.	0	1
		None of the above.	1	1
65	Domestic Wells	The closest wells or water bodies that currently provide drinking water are:		[NRv]
		Within 0-100 m. of the AA.	0	1
		100-500 m. away.	0	1
		>500 m. away, or no information.	1	
	Calcareous Fen	The AA is, or is part of, a calcareous fen. See the Plants. Calcar worksheet in the accompanying Supplnfo file for list of plant indicators	0	[PH, PR]

essor (S) Data Form for Non-Tidal	Wetlands, WESP-AC for New B	runswick. Version 2.	
Aberrant Timing of Water Inputs			
In the last column, place a check mark next to any item that is likely t	to have caused the timing of water inputs (but not necessarily their	r valuma) to shift hy hours, days, or weeks, hecoming either more o	nutad (smaller or less fraquent needs spread over langer time
more temporal homogeneity of flow or water levels) or more flashy (la			lated (Smaller or less frequent peaks spread over longer time.
Stormwater from impervious surfaces that drains directly to the wetl	and.		
Water subsidies from wastewater effluent, septic system leakage, si	now storage areas, or irrigation.		
Regular removal of surface or groundwater for irrigation or other con	nsumptive use.		
Flow regulation in tributaries or water level regulation in adjoining water	ater body, or other control structure at water entry points that regu	lates inflow to the wetland.	
A dam, dike, levee, weir, berm, or fill within or downgradient from	the wetland that interferes with surface or subsurface flow in/ou	t of the AA (e.g., road fill, wellpads, pipelines).	
Excavation within the wetland, e.g., dugout, artificial pond, dead-end	1 ditch.		
Artificial drains or ditches in or near the wetland.			
Accelerated downcutting or channelization of an adjacent or interna	I channel (incised below the historical water table level).		
Logging within the wetland.			
Subsidence or compaction of the wetland's substrate as a result of t			
Straightening, ditching, dredging, and/or lining of tributary channels.		no managemble offset on the timing of vister conditions in any part of	the AA then leave the "O's" for the seems in the following so
If any items were checked above, then for each row of the table belo To estimate effects, contrast the current condition with the condition		to measurable effect on the liming of water conditions in any part of	the AA, then leave the "US" for the scores in the following row
	Severe (3 points)	Medium (2 points)	Mild (1 point)
Spatial extent of timing shift within the wetland:	>95% of wetland.	5-95% of wetland.	<5% of wetland.
When most of the timing shift began:	<3 yrs ago.	3-9 yrs ago.	10-100 yrs ago.
Score the following 2 rows only if the altered inputs began within pas	t 10 years, and only for the part of the wetland that experiences th	nose.	
Input timing now vs. previously:	Shift of weeks.	Shift of days.	Shift of hours or minutes.
Flashiness or muting:	Became very flashy or controlled.	Intermediate.	Became mildly flashy or controlled.
			Sum=

Summary Ratings for Grouped Functions:						
HYDROLOGIC Group (WS)	2.66	Moderate	0.37	Lower	5.11	0.45
WATER QUALITY SUPPORT Group (max+avg/2 of SR, PR, NR, CS)	5.68	Higher	3.85	Lower	7.26	3.82
AQUATIC SUPPORT Group (max+avg/2 of SFS, INV, OE, WC)	4.89	Moderate	2.42	Moderate	4.57	1.61
AQUATIC HABITAT Group (max+avg/2 of FA, FR, AM, WBF, WBN)	1.93	Lower	0.89	Lower	3.00	1.80
TRANSITION HABITAT Group (max+avg/2 of SBM, PH, POL)	8.28	Higher	3.94	Moderate	6.83	3.48
WETLAND CONDITION (EC)			4.94	Moderate		7.08
WETLAND RISK (average of Sensitivity & Stressors)			4.91	Higher		3.84
	NOTE: A scor	e of 0 does not	mean the func	tion or benefit i	s absent from t	he wetland. It

NOTE: A score of 0 does not mean the function or benefit is absent from the wetland. It means only that this wetland has a capacity that is equal or less than the lowest-scoring one, for that function or benefit, from among the 98 NB calibration wetlands that were assessed previously.

Cover Page: Basic Description of Assessment	WESP-AC version 2
Site Name:	Burchill Wind Energy Project - BB-W-01
Investigator Name:	Derrick Mitchell
Date of Field Assessment:	5 August 2020
Nearest Town:	Lorneville (west Saint John), New Brunswick
Latitude (decimal degrees):	45.195989
Longitude (decimal degrees):	-66.201031
Is a map based on a formal on-site wetland delineation available?	Yes
Approximate size of the Assessment Area (AA, in hectares):	4.25
AA as percent of entire wetland (approx.). Attach sketch map if AA is smaller than the entire contiguous wetland.	
What percent (approx.) of the wetland were you able to visit?	100
What percent (approx.) of the AA were you able to visit?	100
Were you able to ask the site owner/manager about any of the questions?	No
Indicate here if you intentionally surveyed for rare plants, calciphile plants, or rare animals	Yes
Have you attended a WESP-AC training session? If so, indicate approximate month & year	Yes, September 2016
How many wetlands have you assessed previously using WESP-AC? (approx.)	100+
Comments about the site or this WESP-AC assessment (attach extra page if desired):	

Form OF (Office). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Conduct an assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answering many of the questions below will require using these online map viewers:

Google Earth Pro: https://www.google.com/earth/download/gep/agree.html

GeoNB: http://www.snb.ca/geonb1/ and http://www.snb.ca/geonb1/e/apps/apps-E.asp

For most wetlands, completing this office data form will require 1-2 hours. For a list of functions to which each question pertains, see bracketed abbreviations in the Definitions/Explanations column. For detailed descriptions of each WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, PO= Pollinator Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity, STR= Stressors.

)F1	Indicators	Condition Choices	Data	Definitions/Explanations
	Province	Mark the province in which the AA is located by changing the 0 in the column next to it to a *1". Mark only one.		This determines to which province's calibration wetlands the raw score of any wetland is normalise
		New Brunswick	1	In the function and benefits models, it also triggers the automatic exclusion of indicators for which spatial data exists in a particular province.
		Nova Scotia	0	Sparad data oxists in a particular province.
		Prince Edward Island	0	1
		Newfoundland-Labrador	0	1
2	Ponded Area Within 1 km.	The area of surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) within 1 km is:		"Adjacent" means not separated from the AA by a wide expanse (>50 m) of upland (including roa >50 m wide). Include ponded areas likely to be hidden by wetland vegetation. If surface water
		<0.01 hectare (about 10 m x 10 m).	0	extends beyond 1 km, include only the part within 1 km. Do not include tidal areas. Measure the
		0.01 - 0.1 hectare.	0	from aerial imagery using Google Earth Pro (click on Ruler icon in toolbar, then Polygon in pop-up
		0.1 - 1 hectare.	0	menu). With the GeoNB viewer, enable the Wetlands layer, then measure with the Draw & Meass tool after specifying Aerial as the Basemap. However, do not rely entirely on wetland boundaries
		1 to 10 hectares.	1	shown in online wetlands layers. [PH, SBM, WBN]
		10 to 100 hectares.	0	
		>100 hectares.	0	1
3	Ponded Water & Wetland Within 1 km.	The area of wetlands and surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) within 1 km is:	n	See definition of adjacent in OF2. If the AA's wetland vegetation extends beyond 1 km, include o the part within 1 km. "Ponded" means not flowing in rivers or streams. [Sens, WBF]
		<0.01 hectare (about 10 m x 10 m).	0	
		0.01 - 0.1 hectare.	0	
		0.1 - 1 hectare.	0	
		1 to 10 hectares.	1	
		10 to 100 hectares.	0	
		>100 hectares.	0	
4	Size of Largest Nearby Vegetated Tract or	The largest vegetated patch or corridor that includes the AA's vegetation plus aladjacent upland vegetation that is not lawn, row crops, heavily grazed lands, conifer plantation is:		See definition of adjacent in OF2. Use Google Earth Pro's polygon ruler (as described above). Exclude conifer plantations only if it is obvious that trees were planted in rows. [AM, PH, SBM, Se
	Corridor	<0.01 hectare (about 10 m x 10 m).	0	
		0.01 - 0.1 hectare.	0	
		0.1 - 1 hectare.	0	
		1 to 10 hectares.	0	
		10 to 100 hectares.	0	1
		100 to 1000 hectares.	0	
		>1000 hectares. [This is nearly always the answer in relatively undeveloped landscapes]	1	
5	Distance to Large Vegetated Tract	The minimum distance from the edge of the AA to the edge of the closest vegetated land (but excluding row crops, lawn, conifer plantation) larger than 375 hectares (about 2 km on a side), is:		To measure distance, use Google Earth Pro (Ruler > Line tool). Or use Draw & Measure tool at GeoNB. The 375-ha criterion is from the Fundy Model Forest Project. [AM, PH, POL, SBM, Sens
		450 m, and not separated from the 375-ha vegetated area by any width ofpaved roads, stretches of open water, row crops, bare ground, lawn, or impervious surface. Or the AA itself contains >375 ha of vegetation. [This is often the answer in relatively undeveloped landscapes.]	1 s.]	
		<50 m, but completely separated from the 375-ha vegetated area by those features, and AA does not contain >375 ha of vegetation.	0	
		50-500 m, and not separated.	0	1
		50-500 m, but separated by those features.	0	1
		0.5 - 5 km, and not separated.	0	
		0.5 - 5 km, but separated by those features.	0	1
		None of the above (the closest patches or corridors which are that large are >5 km away).	0	
6	Herbaceous Uniqueness	The AA's vegetation cover is >10% herbaceous* but uplands within 5 km have <10% herbaceous cover. If so, enter "3" and continue to OF7. If not, consider: The AA's vegetation cover is >10% herbaceous* but uplands within 1 km have <10% herbaceous cover. If so enter "2" and continue to OF7. If not, consider: The AA's vegetation cover is >10% herbaceous* but uplands within 100 m of the wetland edge have <10% herbaceous cover. If so, enter "1". "NOTE: Exclude lawns, row crops, heavily grazed lands, forest, shrublands. Include moss as well as grasslike plants in this use of 'herbaceous vegetation']	2	For this question only, consider moss to be herbaceous vegetation. Determine the score by view areal imagery in Google Earth after successively drawing or estilianting the boundaries of the but of 5 km, 1 km, and 100 m radius focused on the center of the AA. Circles of specified radius can drawn in Google Earth Pro by clicking on the Ruler icon, then Circle in the pop-up menu. [AMv, F POLv, SBMv, WBFv, WBNv]
7	Woody Uniqueness	The AA's vegetation cover is >10% woody" but uplands within 5 km have <10% woody cover. If so, enter "3" and continue to OF8. If not,	3	See above. Do not consider conifer plantations to be forest if it is obvious that trees were planted
		consider: The AA's vegetation is >10% woody" but uplands within 1 km have <10% woody cover. If so enter "2" and continue to OF8. If not, consider:		rows. [AMv, PHv, POLv, SBMv]
		The ARS vegetation is >10% woody* but uplands within 100 m of the wetland edge have <10% woody cover. If so, enter "1" [" NOTE: woody cover = trees & shrubs taller than 1 m.]		
8	Local Vegetated Cover Percentage	Draw a 5-km radius circle measured from the center of the AA. Ignoring all permanent water in the circle, the percent of the remaining are that is wooded or unmanaged herbaceous vegetation (NOT lawn, row crops, bare or heavily grazed land, clearcuts, or conifer plantations) s:		In Google Earth, draw the 5 km buffer and then estimate land cover percentages, or do GIS analy of an appropriate land cover layer. Date: 5 August 2020 Site Identifier: BB-W-01 Investigator: Derrick Mitcl

Form F (Field). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Walk for no less than 10 minutes from the wetland edge towards its core, in the part of the AA that is proposed for alteration. If no alteration is proposed, walk in a portion that appears to be most representative of the wetland overall. Walk only where it is safe and legal to do so. Conduct the assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answer these questions primarily based on your onsite observations and interpretations. Do not write in shaded parts of this data form. Answering some questions accurately may require conferring with the landowner or other knowledgable persons and/or reviewing aerial imagery. For most wetlands, completing this field data form will require 1-2 hours on a site. For a list of functions to which each question pertains, see the accompanying Interpretations form. For detailed descriptions of each WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage & Delay, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity, STR= Stressors.

,,	to die	Condition of the		Definitions in 1
#	Indicators	Condition Choices	Data	Definitions/Explanations
1	Wetland Type	Follow the key below and mark the ONE row that best describes MOST of the vegetated part of the AA:		Ericaceous shrubs are ones in the heather family (Ericaceae). Most have leathery evergreen leaves. They include rhododendron, azalea, swamp laurel, leatherleaf, Labrador tea, and others. Most require
		A. Moss and/or lichen cover more than 25% of the ground. Often dominated by ericaceous shrubs (e.g., Labrador tea) or other acid-tolerant plants (e.g., bog cranberry, pitcher plant, sundew, orchids). Substrate is mostly undecomposed peat. Choose between A1 and A2 and mark the choice with a 1 in their adjoining column. Otherwise go to 8 below.		acidic soil. Although not in the family Ericaceae, sweetgale (<i>Myrica gale</i>) should be counted also. [AM, CS, FA, FR, INV, NR, OE, PH, Sens, SFS, WBF, WBN]
		A1. Surface water is usually absent or, if present, pH is typically <4.5 and conductivity is usually <100 µS/cm (<64 ppm TDS). Trees are absent or nearly so. Sedge cover usually sparse or absent but cottongrass and/or lichen cover may be extensive, as well as cloudberry, lingonberry, sheep laurel, and a sedge (Carex rarillora). Weltland surface and surrounding landscape are seldom sloping and wetland often is domed (convex). Inlet and outlet channels are usually absent. If known, pH of peat is <4.0.	0	
		A2. Not A1. Surface water, if present, has pH typically >4.5 and conductivity is usually >100 µS/cm (>64 ppm TDS). Sedge cover is usually extensive, and/or tree and fall shrub cover is extensive. Sometimes at toe of slope or edge of water body. An exit channel is usually present. Wetter than A1 and peat depth may be shallower (<2 m).	0	
		B. Moss and/or lichen cover less than 25% of the ground. Soil is mineral or decomposed organic (muck). Choose between B1 and B2 and mark the choice with a 1 in their adjoining column:		
		B1. Trees and shrubs taller than 1 m comprise more than 25% of the vegetated cover. Surface water is mostly absent or inundates the vegetation only seasonally (e.g., vernal pools or floodplain).	1	
		B2. Not B1. Tree & tall shrubs comprise less than than 25% of the vegetated cover. Vegetation is mostly herbaceous, e.g., cattail, bulrush, burreed, pond lily, horsetail. Surface water may be extensive and fluctuates seasonally, being either persistent or drying up partly or entirely.	0	
AA sh nclud ' adja lescn	ould also include part of i e the open water part adj cent " is used synonymoo bed features along their i	the AA should include all persistent waters in ponds smaller than 8 hectares (-283 m on a side) that are adjacent to the AA. The the water area of adjacent ponded water larger than 8 ha and adjacent rivers wider than 20 m. Specifically, the AA should (acent to wetland vegetation and equal in width to the average width of that vegetated zone. Throughout this data form, usly with abutting, adjoining, bordering, contiguous and means no upland (manmade or natural) completely separates the directly shared edge. Features joined only by a channel are not necessarily considered to be adjacent a large portion of their es do not have to be hydrologically connected in order to be considered adjacent.		
2	Wetland Types - Adjoining or Subordinate	If the AA is smaller than 1 ha, mark all other types that occupy more than 1% of the vegetated AA. If the AA is larger than 1 ha, mark all other types which are within or adjacent to the AA and occupy more than 1 ha, as visible from the AA or as interpreted from aerial imagery. Do not mark again the type marked in F1.		1 hectare is 10,000 sq. m or about 2.5 acres. It could have dimensions of 100 m by 100 m, 1000 m by 10 m, or similar. [AM, INV, SBM, WBF]
		A1. A2.	0 1	
		B1. B2.	0	
3	Woody Height & Form Diversity	Following EACH row below, indicate with a number code the percentage of the living vegetation in the AA which is occupied by that feature (6 if >95%, 5 if 75-95%, 4 if 50-75%, 3 if 25-50%, 2 if 5-25%, 1 if <5%, 0 if none). If the vegetated part of the AA is largely herbaceous (non-woody) vegetation, these percentages should not sum to 100%.		Deciduous shrubs in this region usually include buttonbush, Labrador tea, bayberry (Morella), huckleberry, cranberry, cloudberry, sweetgale, alder, willow, birch, ash, dogwood, and a few others. If you assigned a code of 3 or higher to any of the first four choices and the ground cover beneath the
		coniferous trees (may include lamarack) taller than 3 m. deciduous trees taller than 3 m.	4	trees/shrubs is <25% moss, then question F1 might be "B1". [CS, INV, NR, PH, POL, SBM, Sens]
		conferous or ericaceous shrubs or trees 1-3 m tall not directly below the canopy of trees.	1	
		deciduous shrubs or trees 1-3 m tall not directly below the canopy of trees.	2	
		coniferous or ericaceous shrubs <1 m tall not directly below the canopy of taller vegetation. deciduous shrubs or trees <1 m tall (e.g., deciduous seedlings) not directly below the canopy of taller vegetation.	2	
lote :		F3 was marked 2 or greater , SKIP to F9 (N fixers).		
4	Dominance of Most Abundant Shrub	Determine which two woody plant species comprise the greatest portion of the low (<3 m) woody cover . Then choose one:		[PH, POL, SBM, Sens]
	Species	those species together comprise > 50% of such cover. those species together do not comprise > 50% of such cover.	0	
5	Woody Diameter Classes	Mark ALL the types that comprise >5% of the woody canopy cover in the AA or >5% of the wooded areas (if any) along its upland edge (perimeter). The edge should include only the trees whose canopies extend into the AA.		Estimate the diameters at chest height. If small-diameter trees are overtopped (shaded) by larger ones, visualise a "subcanopy" at the average height of the smaller-dbh trees, to serve as a basis for t
		coniferous, 1-9 cm diameter and >1 m tall. broad-leaved deciduous 1-9 cm diameter and >1 m tall.	1	minimum 5% canopy requirement in this question. The trees and shrubs need not be wetland species [AM, CS, POL, SBM, Sens, WBN]
		coniferous, 10-19 cm diameter.	1	
		broad-leaved deciduous 10-19 cm diameter. coniferous, 20-40 cm diameter.	1	
		broad-leaved deciduous 20-40 cm diameter.	1	
		coniferous, >40 cm diameter.	1	
5	Height Class	broad-leaved deciduous >40 cm diameter. Follow the key below and mark the ONE row that best describes MOST of the AA:	0	[AM, INV, NR, PH, SBM, Sens]
	Interspersion	A. Neither the vegetation taller than 1 m nor the vegetation shorter than that comprise >70% of the vegetated part of the AA. They <u>each</u> comprise 30-70%. Choose between A1 and A2 and mark the choice with a 1 in the adjoining column. Otherwise go to B below.		
		A1. The two height classes are mostly scattered and intermixed throughout the AA.	0	
		A2. Not A1. The two height classes are mostly in separate zones or bands, or in proportionately large clumps. B. Either the vegetation shorter than 1 m comprises >70% of the vegetated part of the AA, or the vegetation taller than that does. One size		
		class might even be totally absent. Choose between B1 and B2 and mark the choice with a 1 in the adjoining column:		
		class might even be totally absent. Choose between B1 and B2 and mark the choice with a 1 in the adjoining column: B1. The less prevalent height class is mostly scattered and intermixed within the prevalent one. B2. Not B1. 	Fluctuation Range	<10 cm change (stable or nearly so).	0	without multiple visits, consider asking the land owner or neighbors about it. [AM, CS, INV, NR, OE, PH, PR, SR, WBN, WS]
		10 cm - 50 cm change.	0	1
		0.5 - 1 m change. 1-2 m change.	0	
		>2 m change.	0	1
Is the a		water smaller than 0.01 hectare (about 10m x 10m, or 1m x 100 m)? If so, enter *1* in column D and SKIP TO F42	0	
F29	Predominant Depth	During most of the time when surface water is present during the growing season, its depth, averaged over the entire inundated part of the AA.is:		If a boat is unavailable, estimate this by considering wetland size and local topography. Or if timing and safety allow, depths may be measured by drilling through winter ice. This question is asking about the
	Class	<10 cm deep (but >0).	0	spatial median depth that occurs during most of that time, even if inundation is only seasonal or
		10 - 50 cm deep.	0	temporary. If inundation in most but not all of the wetland is brief, the answer will be based on the depth of the most persistently inundated part of the wetland. Include surface water in channels and ditches as
		0.5 - 1 m deep.	1	well as ponded areas. [CS, FA, FR, INV, OE, PH, PR, Sens, SFS, SR, WBF, WBN, WC]
		1 - 2 m deep. >2 m deep. True for many fringe wetlands.	0	-
F30	Depth Classes -	When present, surface water in most of the AA usually consists of (select one):	0	Estimate these proportions by considering the gradient and microtopography of the site. [FR, INV,
	Evenness of	One depth class that comprises >90% of the AA's inundated area (use the classes in the question above).	0	WBF, WBN]
	Proportions	One depth class that comprises 50-90% of the AA's inundated area.	1	
F04		Neither of above. There are 3 or more depth classes and none occupy >50%.	0	
F31	% of Water That Is Ponded (not Flowing)	During most times when surface water is present, the percentage that is (1) ponded (stagnant, or flows so slowly that fine sediment is not held in suspension) AND (2) is likely to be deeper than 0.5 m in some places, is: -5% of the water, or it occupies <100 s.g.m.cumulatively. Nearly all the surface water is flowing. SKIP to F34.	0	Nearly all wellands with surface water have some ponded water. [AM, CS, INV, NR, OE, PR, Sens, SR, WBF, WBN, WC, WS]
		5-30% of the water, or it occupies < 100 sq.m cumulativery. Nearly all the surface water is nowing. SKIP to F34.	0	1
		30-70% of the water.	0	1
		70-95% of the water.	1	
F32	Ponded Open Water - Minimum Size	>95% of the water. During most of the growing season, the largest patch of open water that is ponded and is in or bordering the AA is >0.01 hectare (about 10 m by 10 m) and mostly deeper than 0.5 m. If true enter "1" and continue, If false, enter "0" and SKIP to F41 (Floating Algae & Duckweed).	1	Open water is not obscured by vegetation in aerial ("duck's eye") view. It includes vegetation floating on the water surface or entirely submersed beneath it.
F33	% of Ponded Water	In ducks-eye aerial view, the percentage of the ponded water that is open (lacking emergent vegetation during most of the growing season, and unhidden by a forest or shrub canopy) is:		[AM, CS, FA, FR, INV, NR, OE, PR, SR, WBF, WBN, WC]
	that is Open	None, or <1% of the AA and largest pool occupies <0.01 hectares. Enter "1" and SKIP to F41 (Floating Algae & Duckweed).	0	1
		1-4% of the ponded water. Enter "1" and SKIP to F41 (Floating Algae & Duckweed).	0]

		700 - 64	0	1
		>75% of the water edge.	0	
F36	Robust Emergents	3-73-b unlew water edge. The percentage of the emergent vegetation cover in the AA that is cattail (<i>Typha</i> spp.), common reed (<i>Phragmiles</i>), or tall (>1m) bulrush is:	0	Emergent vegetation is herbaceous plants whose stems are partly above and partly below the water surface during most of the time water is present. [WBN]
F36	Robust Emergents	-	0	Emergent vegetation is herbaceous plants whose slems are partly above and partly below the water surface during most of the time water is present. [WBN]
F36	Robust Emergents	The percentage of the emergent vegetation cover in the AA that is cattail (<i>Typha</i> spp.), common reed (<i>Phragmilles</i>), or tall (>1m) bullrush is: 41% of the emergent vegetation, or emergent vegetation is absent. SKIP to F38. 1-25% of the emergent vegetation.	0	
F36	Robust Emergents	The percentage of the emergent vegetation cover in the AA that is caltail (<i>Typha</i> spp.), common reed (<i>Phragmiles</i>), or tall (>1m) bulrush is: <1% of the emergent vegetation, or emergent vegetation is absent. SKIP to F38.		

FieldF form - Non-tidal Page 3 of 5

F37	Interspersion of	During most of the part of the growing season when water is present, the spatial pattern of emergent vegetation within the water is mostly:		[AM, FA, FR, INV, NR, OE, PH, PR, SBM, SR, WBF, WBN]
	Emergents & Open Water	Scattered. More than 30% of such vegetation forms small islands or corridors surrounded by water.	0	
	water	Intermediate.	0	
		Clumped. More than 70% of such vegetation is in bands along the wetland perimeter or is clumped at one or a few sides of the surface water area.	1	
F38	Persistent Deepwater	If the deepest patch of surface water (flowing or ponded) in or directly adjacent to the AA is mostly deeper than 0.5 m for >2 weeks during the growing season, enter *1* and continue. If not, enter *0* and SKIP to F42 (Connection).	- 1	
F39	Area Non-vegetated Aquatic	During most of the growing season and in waters deeper than 0.5 m, the cover for fish, aquatic invertebrates, and/or amphibians that is		For this question, consider only the wood that is at or above the water surface. Estimates of underwater
	Cover	provided NOT by living vegetation, but by accumulations of dead wood and undercut banks is:	0	wood based only on observations from terrestrial viewpoints are unreliable so should not be attempted. [AM, FA, FR, INV]
		Little or none. Intermediate.	0	[Pan, 17, 114, 1144]
E40	Indicated televid	Extensive.	0	BADAR
F40	Isolated Island	The AA contains (or is part of) an island or beaver lodge within a lake, pond, or river, and is isolated from the shore by water depths > 1 m on all sides during an average June. The island may be solid, or it may be a floating vegetation mat that is sufficiently large and dense to support a waterbird nest.	0	[WBN]
	Duckweed	At some time of the year, mats of algae and/or duckweed are likely to cover >50% of the AA's otherwise-unshaded water surface, or blanket >50% of the underwater substrate. If true, enter "1" in next column. If untrue or uncertain, enter "0".	0	[EC, PR, WBF]
F42	Channel Connection & Outflow Duration	The most persistent surface water connection (outlet channel or pipe, dilch, or overbank water exchange) between the AA and a downslope stream network is; [Note: If the AA represents only part of a wetland, answer this according to whichever is the least permanent surface connection: the one between the AA and the rest of the wetland, or the surface connection between the wetland and the downslope stream network.] Persistent (surface water flows out for >9 months/year).	1	Consider the connection regardless of whether the surface water is frozen. The "downslope stream network" could consist of difches, rivers, ponds, or lakes which eventually connect to the ocean. If this cannot be determined while visiting the AA, consult lopographic maps perhaps by viewing these online with Toporama (http://atlas.nrcan.gc.ca/loporama/en/index.html) [CS, FA, FR, NR, OE, PR, Sens, SFS SR, WCv, WS]
		Seasonal (surface water flows out for 14 days to 9 months/year, not necessarily consecutive).	0	
		Temporary (surface water flows out for <14 days, not necessarily consecutive). None but maps show a stream network downslope from the AA and within a distance that is less than the AA's length. SKIP to F47 (pH	0	
		Measurement).		
		No surface water flows out of the wetland except possibly during extreme events (<once (ph="" 10="" a="" an="" ditch,="" f47="" flows="" into="" lacks="" lake="" measurement).<="" only="" or="" or,="" outlet.="" per="" skip="" td="" that="" to="" water="" wetland,="" years).=""><td>0</td><td></td></once>	0	
F43	Outflow Confinement	During major runoff events, in the places where surface water exits the AA or connected waters nearby, the water:		"Major runoff events" would include biennial high water caused by storms and/or rapid snowmelt. [CS, NR, OE, PR, Sens, SR, STR, WS]
		Mostly passes through a pipe, culvert, narrowly breached dike, berm, beaver dam, or other partial obstruction (other than natural topography) that does not appear to drain the wetland artificially during most of the growing season.	0	
		Leaves through natural exits (channels or diffuse outflow), not mainly through artificial or temporary features. Is exported more quickly than usual due to ditches or pipes within the AA or connected to its outlet, or within 10 m of the AA's edge, which	0	
544		drain the wetland artificially, or water is pumped out of the AA.		
F44	Tributary Channel	At least once annually, surface water from a tributary channel that is >100 m long moves into the AA. Or, surface water from a larger permanent water body adjacent to the AA spills into the AA. If it enters only via a pipe, that pipe must be fed by a mapped stream or lake further upslope. If no, SKIP to F47 (pH Measurement).	0	If inlet tributaries cannot be searched for due to inaccessibility of part of the AA, follow suggestions in F42 above. [NRv, PH, PRv, SRv]
F45	Input Water Temperature	Based on lack of shade, water source characteristics, or actual temperature measurements, the inflow is likely to be warmer than surface water in the AA during part of most years. Enter 1= yes, 0= no.	0	[wcv]
F46	Throughflow	During its travel through the AA at the time of peak annual flow, water arriving in channels: [select only the ONE encountered by most of the incoming water].		[FA, FR, INV, NR, OE, PR, SR, WS]
	Resistance	Does not bump into many plant stems as it travels through the AA. Nearly all the water continues to travel in unvegetated (often incised)	1	
		channels that have minimal contact with wetland vegetation, or through a zone of open water such as an instream pond or lake.		
		Bumps into herbaceous vegetation but mostly remains in fairly straight channels. Bumps into herbaceous vegetation and mostly spreads throughout, or is in widely meandering, multi-branched, or braided channels.	0	
		Bumps into tree trunks and/or shrub stems but mostly remains in fairly straight channels. Bumps into tree trunks and/or shrub stems and follows a fairly indirect path from entrance to exit (meandering, multi-branched, or braided).	0	
F47	pH Measurement	The pH in most of the AA's surface water:		Preferably, measure this in larger areas of ponded surface water within the AA, or in streams that have
		Was measured, and is: [enter the reading in the column to the right.]		passed through (not along) most of the AA. Unless surface water is completely absent, do not dig holes or make depressions in peat in order to provide water for this measurement. Avoid measuring near
		Was not measured but surface water is present and is darkly tea-coloured. Or if no surface water, then mosses and plants that indicate peatland (e.g., Labrador tea) are prevalent. Enter "1". Neither of above. Enter "1".	0	roads or in puddles formed only by recent rain. [AM, FA, FR, NR, WBF, PH, PR, Sens, WBF, WBN]
F48	TDS and/or	The TDS (total dissolved solids) or conductivity off the AA's surface water is: (select the first true row with information):		See above for measurement guidance. [FR, INV, NRv, PH, PRv, Sens]
	Conductivity	TDS is: [Enter the reading in ppm or mg/L in the column to the right, if measured, or answer next row.]		
		Conductivity is [Enter the reading in µSkcm in the column to the right.] Was not measured, but plants that indicate saline conditions cover much of the vegetated AA. Enter *1*.	0	
E40	0 0 1 1 1 11	Neither of above	1	IFA FD DU CDM Core MDF MDM
F49	Beaver Probability	Use of the AA by beaver during the past 5 years is (select most applicable ONE): Evident from direct observation or presence of gnawed limbs, dams, tracks, dens, lodges, or extensive stands of water-killed trees (snags).	1	[FA, FR, PH, SBM, Sens, WBF, WBN]
		Likely based on known occurrence in the region and proximity to suitable habitat, which may include: (a) a persistent freshwater wetland, pond, or lake, or a perennial low or mid-gradient (<10%) channel, and (b) a corridor or multiple stands of hardwood trees and shrubs in	0	
		vegetated areas near surface water. Unlikely because site characteristics above are deficient, and/or this is a settled area or other area where beaver are routinely removed.	0	
F50	Groundwater Strength	Onlinery decadase site characteristics above are deficient, and/or ansists a senied area or order area where beaver are rounterly removed. Select first applicable choice:		Adhere to these criteria strictly do not use personal judgment based on fen conditions, pH, or other
	of Evidence	Springs are known to be present within the AA, or if groundwater levels have been monitored, that has demonstrated that groundwater primarily discharges to the wetland for longer periods during the year than periods when the wetland recharges the groundwater.	0	evidence. Consult lopographic maps to detect breaks in slope described here. Rust deposits associated with groundwater seeps may be most noticeable as orange discoloration in ice formations along streams during early winter. [AM, CS, FA, FR, INV, NR, OE, PH, PRv, SFS, WC, WS]
		Most of the AA has a slope of >5%, or is very close to the base of a natural slope longer than 100 and much steeper than the slope of the AA, AND the pH of surface water, if known, is >5.5.	0	
F51	Internal Gradient	Neither of above is true, although some groundwater may discharge to or flow through the AA. Or groundwater influx is unknown. The gradient along most of the flow path within the AA is:		This is not the same as the shoreline slope. It is the elevational difference between the AA's inlet and
		<2% or the AA has no surface water outlet (not even seasonally).	1	outlet, divided by the flow-distance between them and converted to percent. If available, use a clinometer to measure this. Free clinometer apps can be downloaded to smartphones. If the wetland is
		2-5%. 6-10%.	0	large (longer than –1 km), this may be estimated using Google Earth to determine the minimum and maximum elevation within the AA, then dividing by length and multiplying by 100. [CS, NR, OE, PR,
		>10%.	0	maximum elevation within the AA, then dividing by length and multiplying by 100. [CS, NR, OE, PR, SR, WBF, WBN, WS]
		ions: If the AA lacks an upland edge, evaluate based on the AA's entire perimeter, and moving outward into whatever areas are nese questions are best answered by measuring from aerial images.		
F52	Vegetated Buffer as %	Within a zone extending 30 m laterally from the AA's edge with upland and/or other wetlands, the percentage that contains perennial		[AM, FA, FR, INV, NRv, PH, POL, PRv, SBM, Sens, SRv, STR, WBN]
	of Perimeter	vegetation cover (except lawns, row crops, heavily grazed land, conifer plantations) is: 45%.	0

Assessment Area (AA) Results:

Wetland ID: BB-W-01

Date: 5 August 2020

Observer: Derrick Mitchell

Latitude & Longitude (decimal degrees): 45.195989, -66.201301

Scores will appear below after data are entered in worksheets OF, F, and S. See Manual for definitions and descriptions of how scores were computed.

computed.						
Wetland Functions or Other Attributes:	Function Score (Normalised)	Function Rating	Benefits Score (Normalised)	Benefits Rating	Function Score (raw)	Benefits Score (raw)
Water Storage & Delay (WS)	1.99	Lower	0.42	Lower	3.26	0.50
Stream Flow Support (SFS)	5.83	Moderate	3.33	Moderate	3.11	1.94
Water Cooling (WC)	3.96	Moderate	4.25	Moderate	2.64	2.56
Sediment Retention & Stabilisation (SR)	3.11	Moderate	1.71	Lower	5.29	1.04
Phosphorus Retention (PR)	3.98	Moderate	8.23	Higher	5.73	7.78
Nitrate Removal & Retention (NR)	1.40	Lower	7.50	Higher	4.70	7.78
Carbon Sequestration (CS)	3.83	Moderate			6.21	
Organic Nutrient Export (OE)	6.90	Higher			5.99	
Anadromous Fish Habitat (FA)	0.00	Lower	0.00	Lower	0.00	0.00
Resident Fish Habitat (FR)	0.00	Lower	0.00	Lower	0.00	0.00
Aquatic Invertebrate Habitat (INV)	5.08	Moderate	6.31	Higher	5.66	4.65
Amphibian & Turtle Habitat (AM)	5.93	Moderate	10.00	Higher	6.43	8.70
Waterbird Feeding Habitat (WBF)	9.61	Higher	6.67	Moderate	7.64	6.67
Waterbird Nesting Habitat (WBN)	6.28	Higher	6.67	Moderate	5.36	6.67
Songbird, Raptor, & Mammal Habitat (SBM)	10.00	Higher	10.00	Higher	8.44	10.00
Pollinator Habitat (POL)	9.68	Higher	10.00	Higher	7.80	10.00
Native Plant Habitat (PH)	9.50	Higher	10.00	Higher	6.92	8.75
Public Use & Recognition (PU)			2.48	Moderate		2.10
Wetland Sensitivity (Sens)			2.19	Lower		2.86
Wetland Ecological Condition (EC)			6.39	Moderate		7.92
Wetland Stressors (STR) (higher score means more stress)			10.00	Higher		6.93
Summary Ratings for Grouped Functions:						
HYDROLOGIC Group (WS)	5.83	Higher	0.42	Lower	3.26	0.50
WATER QUALITY SUPPORT Group (max+avg/2 of SR, PR, NR, CS)	3.41	Moderate	7.02	Moderate	5.85	6.65
AQUATIC SUPPORT Group (max+avg/2 of SFS, INV, OE, WC)	6.17	Higher	5.47	Higher	5.17	3.85
AQUATIC HABITAT Group (max+avg/2 of FA, FR, AM, WBF, WBN)	6.98	Higher	7.33	Higher	5.76	6.55
TRANSITION HABITAT Group (max+avg/2 of SBM, PH, POL)	9.86	Higher	10.00	Higher	8.08	9.79
WETLAND CONDITION (EC)			6.39	Moderate		7.92
WETLAND RISK (average of Sensitivity & Stressors)			6.10	Higher		4.90
	NOTE: A sees	o of 0 doos not				

NOTE: A score of 0 does not mean the function or benefit is absent from the wetland. It means only that this wetland has a capacity that is equal or less than the lowest-scoring one, for that function or benefit, from among the 98 NB calibration wetlands that were assessed previously.

Cover Page: Basic Description of Assessment	WESP-AC version 2
Site Name:	Burchill Wind Energy Project - BOF-W-01
Investigator Name:	Derrick Mitchell
Date of Field Assessment:	10 September 2020
Nearest Town:	Lorneville (west Saint John), New Brunswick
Latitude (decimal degrees):	45.157046
Longitude (decimal degrees):	-66.188806
ls a map based on a formal on-site wetland delineation available?	Yes
Approximate size of the Assessment Area (AA, in hectares):	0.58
AA as percent of entire wetland (approx.). Attach sketch map if AA is smaller than the entire contiguous wetland.	
What percent (approx.) of the wetland were you able to visit?	100
What percent (approx.) of the AA were you able to visit?	100
Were you able to ask the site owner/manager about any of the questions?	No
Indicate here if you intentionally surveyed for rare plants, calciphile plants, or rare animals	Yes
Have you attended a WESP-AC training session? If so, indicate approximate month & year	Yes, September 2016
How many wetlands have you assessed previously using WESP-AC? (approx.)	100+
Comments about the site or this WESP-AC assessment (attach extra page if desired):	

Form OF (Office). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Conduct an assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answering many of the questions below will require using these online map viewers:

Google Earth Pro: https://www.google.com/earth/download/gep/agree.html

GeoNB: http://www.snb.ca/geonb1/ and http://www.snb.ca/geonb1/e/apps/apps-E.asp

For most wetlands, completing this office data form will require 1-2 hours. For a list of functions to which each question pertains, see bracketed abbreviations in the Definitions/Explanations column. For detailed descriptions of each WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, PO= Pollinator Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity, STR= Stressors.

F1	Indicators	Condition Choices	Data	Definitions/Explanations
	Province	Mark the province in which the AA is located by changing the 0 in the column next to it to a *1". Mark only one.		This determines to which province's calibration wetlands the raw score of any wetland is normalise
		New Brunswick	1	In the function and benefits models, it also triggers the automatic exclusion of indicators for which spatial data exists in a particular province.
		Nova Scotia	0	spatial data exists in a particular province.
		Prince Edward Island	0	
		Newfoundland-Labrador	0	
2	Ponded Area Within 1 km.	The area of surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) within 1 km is:		"Adjacent" means not separated from the AA by a wide expanse (>50 m) of upland (including rox >50 m wide). Include ponded areas likely to be hidden by wetland vegetation. If surface water
		<0.01 hectare (about 10 m x 10 m).	0	extends beyond 1 km, include only the part within 1 km. Do not include tidal areas. Measure the
		0.01 - 0.1 hectare.	0	from aerial imagery using Google Earth Pro (click on Ruler icon in toolbar, then Polygon in pop-up
		0.1 - 1 hectare.	0	menu). With the GeoNB viewer, enable the Wetlands layer, then measure with the Draw & Meass tool after specifying Aerial as the Basemap. However, do not rely entirely on wetland boundaries
		1 to 10 hectares.	1	shown in online wetlands layers. [PH, SBM, WBN]
		10 to 100 hectares.	0	, , , , , , , , , , , , , , , , , , ,
		>100 hectares.	0	
3	Ponded Water & Wetland Within 1 km.	The area of wetlands and surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) within 1 km is:	1	See definition of adjacent in OF2. If the AA's wetland vegetation extends beyond 1 km, include o the part within 1 km. "Ponded" means not flowing in rivers or streams. [Sens, WBF]
		<0.01 hectare (about 10 m x 10 m).	0	
		0.01 - 0.1 hectare.	0	
		0.1 - 1 hectare.	0	
		1 to 10 hectares.	- 1	
		10 to 100 hectares.	0	
		>100 hectares.	0	
4	Size of Largest Nearby Vegetated Tract or	The largest vegetated patch or corridor that includes the AA's vegetation plus aladjacent upland vegetation that is not lawn, row crops, neavily grazed lands, conifer plantation is:		See definition of adjacent in OF2. Use Google Earth Pro's polygon ruler (as described above). Exclude conifer plantations only if it is obvious that trees were planted in rows. [AM, PH, SBM, Se
	Corridor	<0.01 hectare (about 10 m x 10 m).	0	
		0.01 - 0.1 hectare.	0	
		0.1 - 1 hectare.	0	
		1 to 10 hectares.	0	
		10 to 100 hectares.	0	
		100 to 1000 hectares.	0	
		>1000 hectares. [This is nearly always the answer in relatively undeveloped landscapes]	1	
5	Distance to Large Vegetated Tract	The minimum distance from theedge of the AA to the edge of the closest vegetated land (but excluding row crops, lawn, conifer plantation) larger than 375 hectares (about 2 km on a side), is:		To measure distance, use Google Earth Pro (Ruler > Line tool). Or use Draw & Measure tool at GeoNB. The 375-ha criterion is from the Fundy Model Forest Project. [AM, PH, POL, SBM, Sen:
		<50 m, and not separated from the 375-ha vegetated area by any width opaved roads, stretches of open water, row crops, bare ground, lawn, or impervious surface. Or the AA itself contains >375 ha of vegetation. [This is often the answer in relatively undeveloped landscape	0 s.]	
		<50 m, but completely separated from the 375-ha vegetated area by those features, and AA does not contain >375 ha of vegetation.	0	
		50-500 m, and not separated.	0	
		50-500 m, but separated by those features.	1	
		0.5 - 5 km, and not separated.	0	
		0.5 - 5 km, but separated by those features.	0	
		None of the above (the closest patches or corridors which are that large are >5 km away).	0	
6	Herbaceous Uniqueness	The AA's vegetation cover is >10% herbaceous* but uplands within 5 km have <10% herbaceous cover. If so, enter "3" and continue to OF7. If not, consider: The AA's vegetation cover is >10% herbaceous* but uplands within 1 km have <10% herbaceous cover. If so enter "2" and continue to OF7. If not, consider: The AA's vegetation cover is >10% herbaceous* but uplands within 100 m of the wetland edge have <10% herbaceous cover. If so, enter "1". "NOTE: Exclude lawns, row crops, heavily grazed lands, forest, shrublands. Include moss as well as grasslike plants in this use of 'herbaceous vegetation']	1	For this question only, consider moss to be herbaceous vegetation. Determine the score by view areal imagery in Google Earth after successively drawing or estimating the boundaries of the but of 5 km, 1 km, and 100 m radius focused on the center of the AA. Circles of specified radius can drawn in Google Earth Pro by clicking on the Ruler icon, then Circle in the pop-up menu. [AMv, F POLv, SBMv, WBFv, WBNv]
•	Woody Uniqueness	The AA's vegetation cover is >10% woody* but uplands within 5 km have <10% woody cover. If so, enter "3" and continue to OF8. If not,	1	See above. Do not consider conifer plantations to be forest if it is obvious that trees were planted
7		consider: The AA's vegetation is >10% woody" but uplands within 1 km have <10% woody cover. If so enter "2" and continue to OF8. If not, consider:		rows. [AMv, PHv, POLv, SBMv]
7				
7		The AA's vegetation is >10% woody" but uplands within 100 m of the wetland edge have <10% woody cover. If so, enter "1" [" NOTE: woody cover = trees & shrubs taller than 1 m.]		
	Local Vegetated Cover Percentage			In Google Earth, draw the 5 km buffer and then estimate land cover percentages, or do GIS analy of an appropriate land cover layer. [AM, PH, POL, SBM, Sens]
		[* NOTE: woody cover = trees & shrubs taller than 1 m.] Draw a 5-km radius circle measured from the center of the AA. Ignoring all permanent water in the circle, the percent of the remaining are		
		NOTE: woody cover = trees & shrubs taller than 1 m.] Draw a 5-km radius circle measured from the center of the AA. Ignoring all permanent water in the circle, the percent of the remaining are that is wooded or unmanaged herbaceous vegetation (NOT lawn, row crops, bare or heavily grazed land, clearcuts, or conifer plantations) is:		
		NOTE: woody cover = trees & shrubs taller than 1 m.] Draw a 5-km radius circle measured from the center of the AA. Ignoring all permanent water in the circle, the percent of the remaining are that is wooded or unmanaged herbaceous vegetation (NOT lawn, row crops, bare or heavily grazed land, clearcuts, or conifer plantations) is: -5% of the land.	0

Or use the GeoNB's Draw & Measure tools - Freehand Line to draw and measure the route.

	Distance to Nearest	From the center of the AA, the distance to the nearest maintained public road (dirt or paved) is:		Determine this by viewing aerial imagery in Google Earth and measuring with the Ruler>Line tool.
	Maintained Road	<10 m.	0	use the GeoNB's Draw Line tool. [AM, FAv, FRv, NRv, PH, PU, SBM, STR, WBN]
		10 - 25 m.	0	
		25 - 50 m.	0	
		50 - 100 m. 100 - 500 m.	0	
		>500 m.	0	
OF12	Wildlife Access	Draw a circle of radius of 5 km from the center of the AA. If mammals and amphibians can move from the center of the AA to ALL other separate wetlands and ponds located within the circle without being forced to cross pavement (any width), lawns, bare ground, and/or marine waters, mark 1 = yes can move to all, 0 = no. Change toblank if there are no other wetlands within 5 km.	0	In NB, enable the Welfands layer in GeoNB (despite its omissions) to show surrounding welfands a roads, while estimating the location of the 5 km circle (or draw the 5 km circle in Google Earth Pro using the Circle tool and compare). Evaluate using Google Earth, being cautious to search for road which would find the compared to the CIVIL STID.
OE12	Distance to Ponded	The distance from the AA center to the elecest (but separate) pended water hady visible in CoogleEarth imagenrise		hidden under forest canopy. [AM, SBM, STR] In Google Earth, zoom in closely to examine the surrounding landscape for ponds, takes, and
UF 13	Water	The distance from the AA center to the closest (but separate) ponded water body visible in GoogleEarth imagery is: 450 m, and not separated by any width of paved roads, stretches of open water, row crops, lawn, bare ground, or impervious surface.	0	int sougle cain, zoom in closely to examine the surrounding landscape for portos, takes, and wellands that appear to be permanently flooded. Enable the GeoNB viewer's Wellands layer as w [AM, PH, SBM, Sens, WBF, WBN]
		<50 m, but completely separated by those features.	0	†
		50-500 m, and not separated.	0	1
		50-500 m, but separated by those features.	0	
		0.5 - 1 km, and not separated. 0.5 - 1 km, but separated by those features.	0	
		None of the above (the closest patches or corridors that large are >1 km away).	0	
OF14	Distance to Large	The distance from the AA center to the closest (but separate)non-tidal body of water that is ponded during most of the year and islarger		Determine this by viewing aerial imagery in Google Earth. [Sens, WBF, WBN]
	Ponded Water	than 8 hectares during most of a normal year is:		
		<100 m.	0	
		100 m - 1 km.	0	
		1 -2 km. 2-5 km.	0	
		5-10 km.	0	
		>10 km.	0	1
OF15	Tidal Proximity	The distance from the AA edge to the closest tidal water body (regardless of its salinity) is:		In Google Earth, measure the distance to the ocean (including Bay of Fundy) or tidal river, whichever
		<100 m.	1	is closer. If you need to see how far upriver a river is tidal, see the KMZ file provided with this calculator for NB (NB Headtide). Points shown in those files are only an approximation, so local
		100 m - 1 km.	0	information if available may be preferable. [FA, WBF]
		1 - 5 km.	0	, , , , , , , , , , , , , , , , , , , ,
		5-10 km.	0	
		10-40 km.	0	
051/	Helend Edna Control	>40 km.	0	[NR, SBM, Sens]
UF 16	Upland Edge Contact	Select one: The AA has no upland edge (or upland is <1% of perimeter). The AA is entirely surrounded by (& contiguous with) other wetlands or water	. 0	(ivr, sow, sens)
		1-25% of the AA's perimeter abuts upland (including filled areas). The rest adjoins other wellands or water that is mostly wider than the AA	A 0	
		25-50% of the AA's perimeter abuts upland. The rest adjoins other wetlands or water that is mostly wider than the AA.	0	1
		50-75% of the AA's perimeter abuts upland. The rest adjoins other wetlands or water that is mostly wider than the AA.	0	
		More than 75% of the AA's perimeter abuts upland. Any remainder adjoins other wetlands or water that is mostly wider than the AA.This will be true for most assessments done with WESP-AC.	1	
OF17	Flood Damage from Non	Within 5 km downstream or downslope of the AA (select first true choice):		In the GeoNB map viewer: click on "More" in upper right, then "Flood Information". Expand the me
	tidal Waters		0	under it by clicking on the arrow to its left and the slider to its right. Uncheck the first (Limits of Data
		Maps show Flood Zone or Flood Risk areas and there appears to be infrastructure vulnerable to river flooding not caused by tidal storm surges. Maps show Flood Zone or Flood Risk areas, but infrastructure is absent or is not vulnerable to floods from a non-tidal river. In some case:	0 s 0	box. Where available, LiDAR imagery can provide finer elevational resolution useful for flood modeling. [WSv]
		weeps uptiver dams, or other measures may partly limit damage or risk from smaller events. Maps do not show Flood Zone or Flood Risk areas for no such mapping has been done locally) and there appears to be infrastructure	0	
		vulnerable to river flooding unrelated to tidal storm surges.		
OF18	Relative Elevation in	Maps do not show Flood Zone or Flood Risk areas (or no such mapping has been done locally) and there i no infrastructure vulnerable to river flooding unrelated to lidal storm surges. In Google Earth, enable the Terrain layer (lower left menu) and open the NB. Watersheds KMZ file that accompanies this calculator. Then	1	[FA, NR, Sens, SFSv, WCv, WSv]
	Watershed	determine the AA's approximate elevation (bottom right, NOT the "eye alt"). Then move cursor around to determine the watershed's		. , , , , , , , , , , ,
		maximum and minimum elevation. Divide the AA's elevation by the (max-min).	0.25

Sampling during both low water periods and times with high runoff (storms, snowmetl) indicates no problems in either the AA or inflowing waters. Sampling during both low water periods and times with high runoff (storms, snowmetl) indicates no problems in either the AA or inflowing waters. From a topographic map and field observations, estimate the approximate boundaries of the catchment (CA) of the entire wetland of which AAA may be only a part. Then adjust those boundaries if necessary based on your field observations of the surrounding terrain, and/or using procedures described in the Manual. Divide the area of the wetland (not just the AA) by the approximate area of its catchment excluding the area of the wetland itself. When doing the calculation, if ponded water is adjacent to the wetland, include that in the wetland area.		May use existing data, or sample those waters as part of this wetland assessment. Form F (Field). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Walk for no less than 10 minutes from the wetland edge towards its core, in the part of the AA that is proposed for alteration. If no alteration is proposed, walk in a portion that appears to be most representative of the wetland overall. Walk only where it is safe and legal to do so. Conduct the assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answer these questions primarily based on your onsite observations and interpretations. Do not write in shaded parts of this data form. Answering some questions accurately may require conferring with the landowner or other knowledgable persons and/or reviewing aerial imagery. For most wetlands, completing this field data form will require 1-2 hours on a site. For a list of functions to which each question pertains, see the accompanying Interpretations form. For detailed descriptions of each WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage & Delay, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity, STR= Stressors.

#	Indicators	Condition Choices	Data	Definitions/Explanations
F1	Wetland Type	Follow the key below and mark the ONE row that best describes MOST of the vegetated part of the AA:		Ericaceous shrubs are ones in the heather family (Ericaceae). Most have leathery evergreen leaves. They include rhododendron, azalea, swamp laurel, leatherleaf, Labrador tea, and others. Most require
		A. Moss and/or lichen cover more than 25% of the ground. Often dominated by ericaceous shrubs (e.g., Labrador tea) or other acid-tolerant plants (e.g., bog cranberry, pitcher plant, sundew, orchids). Substrate is mostly undecomposed peat. Choose between A1 and A2 and mark the choice with a 1 in their adjoining column. Otherwise go to B below.		They include incoocerulum, azaka, swainp ladier, redurienar, Ladiadon tea, and diress, wost require acidic soil. Although not in the family Ericaceae, sweetgale (<i>Myrica gale</i>) should be counted also. [AM, CS, FA, FR, INV, NR, OE, PH, Sens, SFS, WBF, WBN]
		A1. Surface water is usually absent or, if present, pH is typically <4.5 and conductivity is usually <100 µS/cm (<64 ppm TDS). Trees are absent or nearly so. Sedge cover usually sparse or absent but cottongrass and/or lichen cover may be extensive, as well as cloudberry, lingonberry, sheep laurel, and a sedge (Carex rarillora). Welfand surface and surrounding landscape are seldom sloping and welfand often is domed (convex). Inlet and outlet channels are usually absent. If known, pH of peat is <4.0.	0	
		A2. Not A1. Surface water, if present, has pH typically >4.5 and conductivity is usually >100 µS/cm (>64 ppm TDS). Sedge cover is usually extensive, and/or tree and tall shrub cover is extensive. Sometimes at toe of slope or edge of water body. An exit channel is usually present. Wetter than A1 and peat depth may be shallower (<2 m).	0	
		B. Moss and/or lichen cover less than 25% of the ground. Soil is mineral or decomposed organic (muck). Choose between B1 and B2 and mark the choice with a 1 in their adjoining column:		
		B1. Trees and shrubs taller than 1 m comprise more than 25% of the vegetated cover. Surface water is mostly absent or inundates the vegetation only seasonally (e.g., vernal pools or floodplain).	0	
		B2. Not B1. Tree & tall shrubs comprise less than than 25% of the vegetated cover. Vegetation is mostly herbaceous, e.g., cattail, butrush, burreed, pond lily, horsetail. Surface water may be extensive and fluctuates seasonally, being either persistent or dying up partly or entirely.	1	
AA sh includ " adja descri	ould also include part of e the open water part ad cent " is used synonymo bed features along their	the AA should include all persistent waters in ponds smaller than 8 hectares (-283 m on a side) that are adjacent to the AA. The life water area of adjacent ponded water larger than 8 ha and adjacent rivers wider than 20 m. Specifically, the AA should lacent to wetland vegetation and equal in width to the average width of that vegetated zone. Throughout this data form, usly with abutting, adjoining, bordering, contiguous and means no upland (manmade or natural) completely separates the directly shared edge. Features joined only by a channel are not necessarily considered to be adjacent a large portion of their es do not have to be hydrologically connected in order to be considered adjacent.		
F2	Wetland Types - Adjoining or Subordinate	If the AA is smaller than 1 ha, mark all other types that occupy more than 1% of the vegetated AA. If the AA is larger than 1 ha, mark all other types which are within or adjacent to the AA and occupy more than 1 ha, as visible from the AA or as interpreted from aerial imagery. Do not mark again the type marked in F1.		1 hectare is 10,000 sq. m or about 2.5 acres. It could have dimensions of 100 m by 100 m, 1000 m by 10 m, or similar. [AM, INV, SBM, WBF]
		A1. A2.	0	
		B1.	0	
F3	Woody Height & Form	B2. Following EACH row below, indicate with a number code the percentage of the living vegetation in the AA which is occupied by that feature (6	0	Deciduous shrubs in this region usually include buttonbush, Labrador tea, bayberry (Morella),
	Diversity	if >95%, 5 if 75-95%, 4 if 50-75%, 3 if 25-50%, 2 if 5-25%, 1 if <5%, 0 if none). If the vegetated part of the AA is largely herbaceous (non-woody) vegetation, these percentages should not sum to 100%. coniferous trees (may include tamarack) taller than 3 m.	0	huckleberry, cloudberry, sweetgale, adder, willow, brich, ash, dogwood, and a few others. If you assigned a code of 3 or higher to any of the first four choices and the ground cover beneath the trees/shrubs is <25% moss, then question F1 might be "B1". [CS, INV, NR, PH, POL, SBM, Sens]
		deciduous trees taller than 3 m.	0	
		coniferous or ericaceous shrubs or trees 1-3 m tall not directly below the canopy of trees.	0	
		deciduous shrubs or trees 1-3 m tall not directly below the canopy of trees. coniferous or ericaceous shrubs <1 m tall not directly below the canopy of taller vegetation.	0	
		deciduous shrubs or trees <1 m tall (e.g., deciduous seedlings) not directly below the canopy of taller vegetation.	0	
Note :		F3 was marked 2 or greater , SKIP to F9 (N fixers).		
F4	Dominance of Most Abundant Shrub	Determine which two woody plant species comprise the greatest portion of the low (<3 m) woody cover . Then choose one: those species together comprise > 50% of such cover.	1	[PH, POL, SBM, Sens]
	Species	those species together do not comprise > 50% of such cover.	0	
F5	Woody Diameter Classes	Mark ALL the types that comprise >5% of the woody canopy cover in the AA or >5% of the wooded areas (if any) along its upland edge (perimeter). The edge should include only the trees whose canopies extend into the AA.		Estimate the diameters at chest height. If small-diameter trees are overtopped (shaded) by larger ones, visualise a "subcanopy" at the average height of the smaller-dbh trees, to serve as a basis for th
		coniferous, 1-9 cm diameter and >1 m tall.	0	minimum 5% canopy requirement in this question. The trees and shrubs need not be wetland species. [AM, CS, POL, SBM, Sens, WBN]

FieldF form - Non-tidal Page 3 of 5

37	Interspersion of	During most of the part of the growing season when water is present, the spatial pattern of emergent vegetation within the water is mostly:		[AM, FA, FR, INV, NR, OE, PH, PR, SBM, SR, WBF, WBN]
E	Emergents & Open Water	Scattered. More than 30% of such vegetation forms small islands or corridors surrounded by water.	0	
	water	Intermediate.	0	
		Clumped. More than 70% of such vegetation is in bands along the wetland perimeter or is clumped at one or a few sides of the surface water area.	0	
	Persistent Deepwater	If the deepest patch of surface water (flowing or ponded) in or directly adjacent to the AA is mostly deeper than 0.5 m for >2 weeks during the	0	
	Area Non-vegetated Aquatic	growing season, enter "1" and continue. If not, enter "0" and SKIP to F42.(Connection). During most of the growing season and in waters deeper than 0.5 m, the cover for fish, aquatic invertebrates, and/or amphibians that is		For this question, consider only the wood that is at or above the water surface. Estimates of underwater
	Cover	provided NOT by living vegetation, but by accumulations of dead wood and undercut banks is:		wood based only on observations from terrestrial viewpoints are unreliable so should not be attempted.
		Little or none. Intermediate.	0	[AM, FA, FR, INV]
		Extensive.	0	
40	Isolated Island	The AA contains (or is part of) an island or beaver lodge within a lake, pond, or river, and is isolated from the shore by water depths > 1 m on all sides during an average June. The island may be solid, or it may be a floating vegetation mat that is sufficiently large and dense to support a waterbird nest.	0	[WBN]
[Duckweed	Al some time of the year, mats of algae and/or duckweed are likely to cover >50% of the AA's otherwise-unshaded water surface, or blankel >50% of the underwater substrate. If true, enter "1" in next column. If untrue or uncertain, enter "0".	0	[EC, PR, WBF]
	Channel Connection & Outflow Duration	The most persistent surface water connection (outlet channel or pipe, ditch, or overbank water exchange) between the AA and a downslope stream network is: [Note: If the AA represents only part of a welland, answer this according to whichever is the least permanent surface connection: the one between the AA and the rest of the wetland, or the surface connection between the wetland and the downslope stream network.] Persistent (surface water flows out for >9 months/year).	0	Consider the connection regardless of whether the surface water is frozen. The "downslope stream network" could consist of ditches, rivers, ponds, or lakes which eventually connect to the ocean. If this cannot be determined while visiting the AA, consult topographic maps perhaps by viewing these online with Toporama (http://atlas.nrcan.gc.ca/loporama/en/index.html) [CS, FA, FR, NR, OE, PR, Sens, SFS SR, WCv, WS]
		Seasonal (surface water flows out for 14 days to 9 months/year, not necessarily consecutive).	0	
		Temporary (surface water flows out for <14 days, not necessarily consecutive). None but maps show a stream network downslope from the AA and within a distance that is less than the AA's length. SKIP to F47 (pH	0	
		Measurement).		
		No surface water flows out of the wetland except possibly during extreme events (<once (ph="" 10="" a="" an="" ditch,="" f47="" flows="" into="" lacks="" lake="" measurement).<="" only="" or="" or,="" outlet.="" per="" skip="" td="" that="" to="" water="" wetland,="" years).=""><td>0</td><td></td></once>	0	
43 (Outflow Confinement	During major runoff events, in the places where surface water exits the AA or connected waters nearby, the water:		"Major runoff events" would include biennial high water caused by storms and/or rapid snowmelt. [CS, NR, OE, PR, Sens, SR, STR, WS]
		Mostly passes through a pipe, culvert, narrowly breached dike, berm, beaver dam, or other partial obstruction (other than natural topography) that does not appear to drain the wetland artificially during most of the growing season.	0	
		Leaves through natural exits (channels or diffuse outflow), not mainly through artificial or temporary features. Is exported more quickly than usual due to ditches or pipes within the AA or connected to its outlet, or within 10 m of the AA's edge, which	0	
44 1	Tributary Channel	is exported more quickly than usual que to diriches or pipes winnin the AA or connected to its outnet, or within 10 m of the AAs edge, which drain the welland artificially, or water is pumped out of the AA. At least once annually, surface water from a tributary channel that is >100 m long moves into the AA. Or, surface water from a larger	U	If inlet tributaries cannot be searched for due to inaccessibility of part of the AA, follow suggestions in
	, , , , , ,	permanent water body adjacent to the AA spills into the AA. If it enters only via a pipe, that pipe must be fed by a mapped stream or lake further upslope. If no, SKIP to F47 (pH Measurement).	0	F42 above. [NRv, PH, PRv, SRv]
	I nput Water Temperature	Based on lack of shade, water source characteristics, or actual temperature measurements, the inflow is likely to be warmer than surface water in the AA during part of most years. Enter 1= yes, 0= no.	0	[WCv]
	Throughflow Resistance	During its travel through the AA at the time of peak annual flow, water arriving in channels: [select only the ONE encountered by most of the incoming water].		[FA, FR, INV, NR, OE, PR, SR, WS]
	Resistance	Does not bump into many plant stems as it travels through the AA. Nearly all the water continues to travel in unvegetated (often incised) channels that have minimal contact with wetland vegetation, or through a zone of open water such as an instream pond or lake.	0	
			_	
		Bumps into herbaceous vegetation but mostly remains in fairly straight channels. Bumps into herbaceous vegetation and mostly spreads throughout, or is in widely meandering, multi-branched, or braided channels.	0	
		Bumps into tree trunks and/or shrub stems but mostly remains in fairly straight channels.	0	
		Bumps into tree trunks and/or shrub stems and follows a fairly indirect path from entrance to exit (meandering, multi-branched, or braided).	0	
47 p	pH Measurement	The pH in most of the AA's surface water:		Preferably, measure this in larger areas of ponded surface water within the AA, or in streams that have
		Was measured, and is: [enter the reading in the column to the right.]		passed through (not along) most of the AA. Unless surface water is completely absent, do not dig holes or make depressions in peat in order to provide water for this measurement. Avoid measuring near
		Was not measured but surface water is present and is darkly tea-coloured. Or if no surface water, then mosses and plants that indicate peatland (e.g., Labrador tea) are prevalent. Enter *11. Neither of above. Enter *11.	0	roads or in puddles formed only by recent rain. [AM, FA, FR, NR, WBF, PH, PR, Sens, WBF, WBN]
	TDS and/or	The TDS (total dissolved solids) or conductivity off the AA's surface water is: (select the first true row with information):		See above for measurement guidance. [FR, INV, NRv, PH, PRv, Sens]
	Conductivity	TDS is: [Enter the reading in ppm or mg/L in the column to the right, if measured, or answer next row.]		
		Conductivity is [Enter the reading in µS/cm in the column to the right.] Was not measured, but plants that indicate saline conditions cover much of the vegetated AA. Enter *1*.	0	
10		Neither of above	1	TEA ED DIL COM C WIDE WIDN
49 E	Beaver Probability	Use of the AA by beaver during the past 5 years is (select most applicable ONE): Evident from direct observation or recesses of approach to the control of	0	[FA, FR, PH, SBM, Sens, WBF, WBN]
		Evident from direct observation or presence of gnawed limbs, dams, tracks, dens, lodges, or extensive stands of water-killed trees (snags).	0	
		Likely based on known occurrence in the region and proximity to suitable habitat, which may include: (a) a persistent freshwater wetland, pond, or lake, or a perennial low or mid-gradient (<10%) channel, and (b) a corridor or multiple stands of hardwood trees and shrubs in yegetated areas near surface water.	0	
		Unlikely because site characteristics above are deficient, and/or this is a settled area or other area where beaver are routinely removed.	- 1	
	Groundwater Strength of Evidence	Select first applicable choice:		Adhere to these criteria strictly do not use personal judgment based on fen conditions, pH, or other evidence. Consult topographic maps to detect breaks in slope described here. Rust deposits
		Springs are known to be present within the AA, or if groundwater levels have been monitored, that has demonstrated that groundwater primarily discharges to the wetland for longer periods during the year than periods when the wetland recharges the groundwater.	0	associated with groundwater seeps may be most noticeable as orange discoloration in ice formations along streams during early winter. [AM, CS, FA, FR, INV, NR, OE, PH, PRv, SFS, WC, WS]
		Most of the AA has a slope of >5%, or is very close to the base of a natural slope longer than 100 and much steeper than the slope of the AA, AND the pH of surface water, if known, is >5.5.	0	
51	Internal Gradient	Neither of above is true, although some groundwater may discharge to or flow through the AA. Or groundwater influx is unknown. The gradient along most of the flow path within the AA is:		This is not the same as the shoreline slope. It is the elevational difference between the AA's inlet and
		<2% or the AA has no surface water outlet (not even seasonally).	0	oullet, divided by the flow-distance between them and converted to percent. If available, use a clinometer to measure this. Free clinometer apps can be downloaded to smartphones. If the wetland is
		2-5%. 6-10%.	1 0	large (longer than ~1 km), this may be estimated using Google Earth to determine the minimum and
		o-10%. >10%.	0	maximum elevation within the AA, then dividing by length and multiplying by 100. [CS, NR, OE, PR, SR, WBF, WBN, WS]

Waterbird Nesting Habitat (WBN)	0.00	Lower	0.00	Lower	0.00	0.00
Songbird, Raptor, & Mammal Habitat (SBM)	5.79	Moderate	5.00	Moderate	4.80	5.00
Pollinator Habitat (POL)	6.57	Moderate	3.33	Moderate	5.29	3.33
Native Plant Habitat (PH)	6.23	Higher	5.15	Moderate	5.60	4.47
Public Use & Recognition (PU)			2.40	Moderate		2.04
Wetland Sensitivity (Sens)			4.62	Moderate		3.59
Wetland Ecological Condition (EC)			3.98	Moderate		6.53
Wetland Stressors (STR) (higher score means more stress)			3.53	Moderate		3.56
Summary Ratings for Grouped Functions:						
HYDROLOGIC Group (WS)	0.68	Lower	1.81	Lower	8.29	1.88
WATER QUALITY SUPPORT Group (max+avg/2 of SR, PR, NR, CS)	8.07	Higher	5.27	Moderate	8.50	5.41
AQUATIC SUPPORT Group (max+avg/2 of SFS, INV, OE, WC)	6.08	Higher	0.62	Lower	5.00	1.16
AQUATIC HABITAT Group (max+avg/2 of FA, FR, AM, WBF, WBN)	2.69	Moderate	1.16	Lower	3.40	1.96
TRANSITION HABITAT Group (max+avg/2 of SBM, PH, POL)	6.38	Moderate	4.83	Moderate	5.41	4.63
WETLAND CONDITION (EC)			3.98	Moderate		6.53
WETLAND RISK (average of Sensitivity & Stressors)			4.07	Moderate		3.57
WETLAND CONDITION (EC)			3.98 4.07	Moderate Moderate	s absent from t	;

NOTE: A score of 0 does not mean the function or benefit is absent from the wetland. It means only that this wetland has a capacity that is equal or less than the lowest-scoring one, for that function or benefit, from among the 98 NB calibration wetlands that were assessed previously.

Cover Page: Basic Description of Assessment	WESP-AC version 2
Site Name:	Burchill Wind Energy Project - FC-Trib1-W-03
Investigator Name:	Derrick Mitchell
Date of Field Assessment:	5 August 2020
Nearest Town:	Lorneville (west Saint John), New Brunswick
Latitude (decimal degrees):	45.190455
Longitude (decimal degrees):	-66.206848
Is a map based on a formal on-site wetland delineation available?	Yes
Approximate size of the Assessment Area (AA, in hectares):	1.16
AA as percent of entire wetland (approx.). Attach sketch map if AA is smaller than the entire contiguous wetland.	
What percent (approx.) of the wetland were you able to visit?	100
What percent (approx.) of the AA were you able to visit?	100
Were you able to ask the site owner/manager about any of the questions?	No
Indicate here if you intentionally surveyed for rare plants, calciphile plants, or rare animals	Yes
Have you attended a WESP-AC training session? If so, indicate approximate month & year	Yes, September 2016
How many wetlands have you assessed previously using WESP-AC? (approx.)	100+
Comments about the site or this WESP-AC assessment (attach extra page if desired):	

Form OF (Office). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Conduct an assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answering many of the questions below will require using these online map viewers:

Google Earth Pro: https://www.google.com/earth/download/gep/agree.html

GeoNB: http://www.snb.ca/geonb1/ and http://www.snb.ca/geonb1/e/apps/apps-E.asp

For most wetlands, completing this office data form will require 1-2 hours. For a list of functions to which each question pertains, see bracketed abbreviations in the Definitions/Explanations column. For detailed descriptions of each WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity, STR= Stressors.

_	Indicators	Condition Choices	Data	Definitions/Explanations
F1	Province	Mark the province in which the AA is located by changing the 0 in the column next to it to a *1". Mark only one.		This determines to which province's calibration wetlands the raw score of any wetland is normalise
		New Brunswick	- 1	In the function and benefits models, it also triggers the automatic exclusion of indicators for which spatial data exists in a particular province.
		Nova Scotia	0	spanial data oxists in a particular province.
		Prince Edward Island	0	1
		Newfoundland-Labrador	0	
	Ponded Area Within 1 km.	The area of surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) within 1 km is:		"Adjacent" means not separated from the AA by a wide expanse (>50 m) of upland (including roa >50 m wide). Include ponded areas likely to be hidden by wetland vegetation. If surface water
		<0.01 hectare (about 10 m x 10 m).	- 1	extends beyond 1 km, include only the part within 1 km. Do not include tidal areas. Measure the
		0.01 - 0.1 hectare.	0	from aerial imagery using Google Earth Pro (click on Ruler icon in toolbar, then Polygon in pop-up menu). With the GeoNB viewer, enable the Wetlands layer, then measure with the Draw & Measr
		0.1 - 1 hectare.	0	tool after specifying Aerial as the Basemap. However, do not rely entirely on wetland boundaries
		1 to 10 hectares.	0	shown in online wetlands layers. [PH, SBM, WBN]
		10 to 100 hectares.	0	
		>100 hectares.	0	1
	Ponded Water & Wetland Within 1 km.	The area of wetlands and surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) within 1 km is:	1	See definition of adjacent in OF2. If the AA's wetland vegetation extends beyond 1 km, include o the part within 1 km. "Ponded" means not flowing in rivers or streams. [Sens, WBF]
		<0.01 hectare (about 10 m x 10 m).	0	
		0.01 - 0.1 hectare.	0	
		0.1 - 1 hectare.	0	
		1 to 10 hectares.	0	1
		10 to 100 hectares.	0	1
		>100 hectares.	- 1	
1	Size of Largest Nearby Vegetated Tract or	The largest vegetated patch or corridor that includes the AA's vegetation plus aladjacent upland vegetation that is not lawn, row crops, heavily grazed lands, conifer plantation is:		See definition of adjacent in OF2. Use Google Earth Pro's polygon ruler (as described above). Exclude conifer plantations only if it is obvious that trees were planted in rows. [AM, PH, SBM, Se
	Corridor	<0.01 hectare (about 10 m x 10 m).	0	
		0.01 - 0.1 hectare.	0	1
		0.1 - 1 hectare.	0	1
		1 to 10 hectares.	0	1
		10 to 100 hectares.	0	1
		100 to 1000 hectares.	0	1
		>1000 hectares. [This is nearly always the answer in relatively undeveloped landscapes]	1	
5	Distance to Large	The minimum distance from the edge of the AA to the edge of the closest <i>vegetated land</i> (but excluding row crops, lawn, conifer		To measure distance, use Google Earth Pro (Ruler > Line tool). Or use Draw & Measure tool at
	Vegetated Tract	plantation) larger than 375 hectares (about 2 km on a side), is:		GeoNB. The 375-ha criterion is from the Fundy Model Forest Project. [AM, PH, POL, SBM, Sens
		450 m, and not separated from the 375-ha vegetated area by any width opaved roads, stretches of open water, row crops, bare ground, lawn, or impervious surface. Or the AA itself contains >375 ha of vegetation. [This is often the answer in relatively undeveloped landscape	1 s.]	
		<50 m, but completely separated from the 375-ha vegetated area by those features, and AA does not contain >375 ha of vegetation.	0	
		50-500 m, and not separated.	0	1
		50-500 m, but separated by those features.	0	1
		0.5 - 5 km, and not separated.	0	1
		0.5 - 5 km, but separated by those features.	0	1
		None of the above (the closest patches or corridors which are that large are >5 km away).	0	
6	Herbaceous Uniqueness	The AA's vegetation cover is > 10% herbaceous* but uplands within 5 km have <10% herbaceous cover. If so, enter "3" and continue to 0F7. If not, consider: The AA's vegetation cover is > 10% herbaceous* but uplands within 1 km have <10% herbaceous cover. If so enter "2" and continue to 0F7. If not, consider: The AA's vegetation cover is > 10% herbaceous* but uplands within 100 m of the wetland edge have <10% herbaceous cover. If so, enter "1".	2	For this question only, consider moss to be herbaceous vegetation. Determine the score by view aerial imagery in Google Earth after successively drawing or estimating the boundaries of the but of 5 km, 1 km, and 100 m radius focused on the center of the AA. Circles of specified radius can drawn in Google Earth Pro by clicking on the Ruler icon, then Circle in the pop-up menu. [AMv, F POLv, SBMv, WBFv, WBNv]
		[* NOTE: Exclude lawns, row crops, heavily grazed lands, forest, shrublands. Include moss as well as grasslike plants in this use of "herbaceous vegetation"]		
7	Woody Uniqueness		2	See above. Do not consider conifer plantations to be forest if it is obvious that trees were planted
7	Woody Uniqueness	The AA's vegetation over is >10% woody' but uplands within 5 km have <10% woody cover. If so, enter "3" and continue to OF8. If not, consider: The AA's vegetation is >10% woody' but uplands within 1 km have <10% woody cover. If so enter "2" and continue to OF8. If not,	2	See above. Do not consider conifer plantations to be forest if it is obvious that trees were planted rows. [AMv, PHv, POLv, SBMv]
7	Woody Uniqueness	"herbaceous vegetation"] The AA's vegetation cover is >10% woody" but uplands within 5 km have <10% woody cover. If so, enter "3" and continue to OF8. If not, consider:	2	
	Woody Uniqueness Local Vegetated Cover Percentage	The AA's vegetation: The AA's vegetation cover is >10% woody' but uplands within 5 km have <10% woody cover. If so, enter "3" and continue to OF8. If not, consider: The AA's vegetation is >10% woody' but uplands within 1 km have <10% woody cover. If so enter "2" and continue to OF8. If not, consider: The AA's vegetation is >10% woody' but uplands within 100 m of the wetland edge have <10% woody cover. If so, enter "1"		rows. [AMv, PHv, POLv, SBMv]
	Local Vegetated Cover	The AA's vegetation: [7] The AA's vegetation cover is >10% woody but uplands within 5 km have <10% woody cover. If so, enter "3" and continue to OF8. If not, consider: The AA's vegetation is >10% woody' but uplands within 1 km have <10% woody cover. If so enter "2" and continue to OF8. If not, consider: The AA's vegetation is >10% woody' but uplands within 100 m of the wetland edge have <10% woody cover. If so, enter "1" [" NOTE: woody cover = trees & shrubs taller than 1 m.] Draw a 5-km radius circle measured from the center of the AA. Ignoring all permanent water in the circle, the percent of the remaining are that is wooded or unmanaged herbaceous vegetation (NOT lawn, row crops, bare or heavily grazed land, clearcuts, or conifer plantations) is:		In Google Earth, draw the 5 km buffer and then estimate land cover percentages, or do GIS analy

OF11	Distance to Nearest	From the center of the AA, the distance to the nearest maintained public road (dirt or paved) is:		Determine this by viewing aerial imagery in Google Earth and measuring with the Ruler>Line tool. O
	Maintained Road	<10 m.	0	use the GeoNB's Draw Line tool. [AM, FAv, FRv, NRv, PH, PU, SBM, STR, WBN]
		10 - 25 m.	0	
		25 · 50 m.	0	
		50 - 100 m. 100 - 500 m.	0	
		>500 m.	0	
OF12	Wildlife Access	Draw a circle of radius of 5 km from the center of the AA. If mammals and amphibians can move from the center of the AA to ALL other separate wetlands and ponds located within the circle without being forced to cross pavement (any width), Jawns, bare ground, and/or marine waters, mark 1 = yes can move to all, 0 = no. Change toblank if there are no other wetlands within 5 km.	0	In NB, enable the Wetlands layer in GeoNB (despite its omissions) to show surrounding wetlands an roads, while estimating the location of the 5 km circle (or draw the 5 km circle in Google Earth Pro using the Circle tool and compare). Evaluate using Google Earth, being cautious to search for roads hidden under forest canopy. [AM, SBM, STR]
OF13	Distance to Ponded	The distance from the AA center to the closest (but separate) ponded water body visible in GoogleEarth imagery is:		In Google Earth, zoom in closely to examine the surrounding landscape for ponds, lakes, and
	Water	<50 m, and not separated by any width of paved roads, stretches of open water, row crops, lawn, bare ground, or impervious surface.	0	wetlands that appear to be permanently flooded. Enable the GeoNB viewer's Wetlands layer as wel [AM, PH, SBM, Sens, WBF, WBN]
		<50 m, but completely separated by those features.	0	
		50-500 m, and not separated. 50-500 m, but separated by those features.	0	
		0.5 - 1 km, and not separated.	0	
		0.5 - 1 km, but separated by those features.	0	
0544	D	None of the above (the closest patches or corridors that large are >1 km away).	0	
UF 14	Distance to Large Ponded Water	The distance from the AA center to the closest (tull separate)non-lidal body of water that is ponded during most of the year and islarger than 8 hectares during most of a normal year is: -100 m.	0	Determine this by viewing aerial imagery in Google Earth. [Sens, WBF, WBN]
		100 m - 1 km.	0	1
		1 -2 km.	0	
		2.5 km.	1	
		5-10 km. >10 km.	0	1
OF15	Tidal Proximity	The distance from the AA edge to the closesttidal water body (regardless of its salinity) is:	Ů	In Google Earth, measure the distance to the ocean (including Bay of Fundy) or tidal river, whicheve
		<100 m.	0	is closer. If you need to see how far upriver a river is tidal, see the KMZ file provided with this
		100 m - 1 km.	0	calculator for NB (NB Headtide). Points shown in those files are only an approximation, so local information if available may be preferable. [FA, WBF]
		1 - 5 km.	1	
		5-10 km.	0	
		10-40 km.	0	-
OF16	Upland Edge Contact	Select one:	Ů	[NR, SBM, Sens]
		The AA has no upland edge (or upland is <1% of perimeter). The AA is entirely surrounded by (& contiguous with) other wetlands or water	0	
		1-25% of the AA's perimeter abuts upland (including filled areas). The rest adjoins other wetlands or water that is mostly wider than the AA	0	
		25-50% of the AA's perimeter abuts upland. The rest adjoins other wetlands or water that is mostly wider than the AA. 50-75% of the AA's perimeter abuts upland. The rest adjoins other wetlands or water that is mostly wider than the AA.	0	
		More than 75% of the AA's perimeter abuts upland. Any remainder adjoins other wetlands or water that is mostly wider than the AA.This	1	
		will be true for most assessments done with WESP-AC.		
OF17	Flood Damage from Non- tidal Waters	Within 5 km downstream or downslope of the AA (select first true choice):		In the GeoNB map viewer: click on "More" in upper right, then "Flood Information". Expand the menu under it by clicking on the arrow to its left and the slider to its right. Uncheck the first (Limits of Data)
	tida Waters	Maps show Flood Zone or Flood Risk areas and there appears to be infrastructure vulnerable to river flooding not caused by tidal storm surges.	0	box. Where available, LiDAR imagery can provide finer elevational resolution useful for flood modeling. [WSv]
		Maps show Flood Zone or Flood Risk areas, but infrastructure is absent or is not vulnerable to floods from a non-tidal river. In some case: levees, upriver dams, or other measures may partly limit damage or risk from smaller events. Maps do not show Flood Zone or Flood Risk areas is no such mapping has been done locally), and there appears to be infrastructure	0	
		vulnerable to river flooding unrelated to tidal storm surges.	1	
OF18	Relative Elevation in	Maps do not show Flood Zone or Flood Risk areas (or no such mapping has been done locally) and there is no infrastructure vulnerable to river flooding uncleated to lidat sorm surges. In Google Earth, enable the Terrain layer (lower left menu) and open the NB_Watersheds KMZ file that accompanies this calculator. Then	'	[FA, NR, Sens, SFSv, WCv, WSv]
OF10	Water Quality Sensitive	determine the AA's approximate elevation (bottom right, NOT the "eye alt"). Then move cursor around to determine the watershed's maximum and minimum elevation. Divide the AA's elevation by the (max-min). In Google Earth, open the KMZ file NB, Watershed Protected Area which accompanies this calculator. The AA is within such an area.	0.20	If an ACCDC report is available for this AA, it also may contain such information. [NRv]
OF20	Water Quality Seristive Watershed or Area Degraded Water	In Google Carit, open the Nnz, the Nnz, which shear Protected Area which accompanies this Calculator. The Art S whith Social and at-a. Enter 1 = yes, 0 = no. Sampling indicates a problem with concentrations ofmetals, hydrocarbons, nutrients, or other substances (excluding bacteria, acidic	U	In all ACCEC reports available for this AA, it also may contain such micromation. [Intro] May use existing data, or sample those waters as part of this wetland assessment, "Harmful" should
	Upstream	water, high temperatures) being present at levels harmful to aquatic life or humans, and:		be evaluated with regard to current federal or provincial water quality standards. [AM, FA, FR, NRv, PRv, SRv, STR, WBF, WBN]
		The condition is present within the AA. The condition is present in waters within 1 km that flowinto the AA, but has not been documented in the AA itself.	0	Tray, Sav, Stray Word, Word
		The condition is present in waters within 1 km that flowinto the AA, but has not been documented in the AA itself. Sampling during both low water periods and times with high runoff (storms, snowmelt) indicates no problems in either the AA or inflowing.	0	1
		waters.		
		Data are insufficient (no or inadequate sampling within 1 km, or condition exists only at >1 km upstream)This is the situation for nearly all wetlands in this region.	1	
OF21	Degraded Water	The problem described above isdownslope from the AA, and:		May use existing data, or monitor waters as part of this wetland assessment. [NRv, PRv, SRv]
	Downstream	The condition is present within 1 km downslope and connected to the AA by a channel.	0	
		The condition is present within 5 km downslope and connected to the AA by a channel, or within 1 km but not connected to the AA by a	0	1
		channel. Sampling during both low water periods and times with high runoff (storms, snowmelt) indicates no problems in either the AA or inflowing waters.	0	
		moters. Data are insufficient (no or inadequate sampling within 1 km, or condition exists only at >1 km upstream)This is the situation for nearly all wetlands in this region.	1	
OF22	Wetland as a % of Its Contributing Area (Catchment)	From a topographic map and field observations, estimate the approximate boundaries of the catchment (CA) of the entire wetland of which the AA may be only a part. Then adjust those boundaries if necessary based on your field observations of the surrounding terrain, and/or using procedures described in the Manual. Divide the area of the wetland (not just the AA) by the approximate area of its catchment excluding the area of the wetland itself. When doing the calculation, if ponded water is adjacent to the wetland, include that in the wetland area. The result is:		Topographic maps may be viewed online at the National Atlas of Canada (Toporama): http://atlas.gc.ca/loporama/en/index.html [NR, PR, Sens, SR, WS]
		< 0.01, or catchment size unknown due to stormwater pipes that collect water from an indeterminate area. 0.01 to 0.1.	0	1
		0.1 to 1.	1	
OF5-		>1 (wetland is larger than its catchment (e.g., wetland with flat surrounding terrain and no inlet, or is entirely isolated by dikes, or is a raise bog).	0	
OF23	Unvegetated Surface in the Contributing Area	The proportion of the AA's contributing area (measured to no more than 1000 m upslope) that is comprised of buildings, roads, parking lot other pavement, exposed bedrock, landstides, and other mostly-bare surface is about: -10%.	1	[FA, INV, NRv, PRv, SRv, STR, WCv, WSv]
		10 to 25%.	0	
		10 to 23%.	U	

OF24	Transport From Upslope	A relatively large proportion of the precipitation that falls farther upslope in the CA reaches this wetland quickly as runoff (surface water), a	9	[NRv, PRv, SRv, WSv]
		indicated by the following:		
		(a) input channel is present,		
		(b) input channels have been straightened, (c) upslope wetlands have been ditched extensively,		
		(d) land cover is mostly non-forest,		
		(e) CA slopes are steep, and/or		
		(f) most CA soils are shallow (bedrock near surface) and/or have high runoff coefficients.		
		This statement is:		
		Mostly true.	0	
		Somewhat true.	0	1
		Mostly untrue.	1	
OF25	Aspect	The overland flow direction of most surface water (in streams, rivers, or runoff) that enters the AA is:		[AM, NR, SFS, WC, WS]
01 23	парсы			[AIII, III., 31.3, II.0, II.3]
		Northward (N, NE). north-facing contributing area.	0	
		Southward (S, SW). south-facing contributing area.	1	
		Other (E, SE, W, NW), or no detectable uphill slope or input channel (flat).		
OF26	Internal Flow Distance	The horizontal flow distance from the wetland's inlet to outlet is:		Identify inlets and outlets, if any, from topographic maps (use elevations to determine which are inlet
	(Path Length)	10	0	and which are outlets) and augment by field inspection. [NR, OE, PR, SR, WS]
		<10 m.	0	
		10 - 50 m.	0	4
		50 - 100 m.	0	
		100 - 1000 m.	1	
		1- 2 km.	0	
		>2 km, or wetland lacks an inlet and outlet.	0	1
OF27	Growing Degree Days	In Google Earth, open the KMZ file that accompanies this calculator, called NB-PEI_GrowingDegreeDays. Place your cursor over the AA	0	This layer was provided by Dr. Dan McKenney of the Canadian Forest Service [AM, CS, FR, INV,
	, ,	and left-click. From the pop-up, enter the GRIDCODE in the next column.	2428	NR, OE, PH, PR, Sens, SR, WBF, WCv, WS]
OF28	Fish Access or Use	According to agency biologists and/or your own observations, the AA. [Nark just the first choice that is true.]:		Regarding the last choice, if uncertain if an AA is fishless, consider the possibility its waters have be
. 20				stocked. In NB, the list of stocked waters is at:
		is known to support rearing and/or spawning by Atlantic salmon or other anadromous species or eels. In NB, consult Figure A-2 in	0	http://www2.gnb.ca/content/gnb/en/departments/erd/natural_resources/content/fish/content/Stocked
		Appendix A of the Manual. Contact local fishery biologists, review the ACCDC report, and visit these websites:		aters.html
		http://www.salmonatlas.com/atlanticsalmon/canada-east/index.1.html http://atlanticsalmonfederation.org/rivers/introduction.html		[AM, FA, FR, INV, WBF, WBN]
		Has not been documented to support Atlantic salmon rearing and/or spawning, but is connected to nearby waters likely to contain Atlantic	0	
		salmon or other anadromous species or eels and is probably accessed by those during some conditions.		
		Is probably is not accessed by any anadromous fish species but is known or likely to hav other fish at least seasonally.	0	
		Is known or likely to be fishless (e.g., too small, dry, and/or not accessible even temporarily, and not stocked).	- 1	
OF29	Species of Conservation	Within the past 10 years, in the AA (or in its adjoining waters or wetland), qualified observers have documented mark all applicable:		Request information from ACCDC and/or conduct your own survey at an appropriate season using a
	Concern			approved protocol. For birds, also check eBird.org. [AMv, EC, PHv, POLv, SBMv, Sens, WBFv,

Form F (Field). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Walk for no less than 10 minutes from the wetland edge towards its core, in the part of the AA that is proposed for alteration. If no alteration is proposed, walk in a portion that appears to be most representative of the wetland overall. Walk only where it is safe and legal to do so. Conduct the assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answer these questions primarily based on your onsite observations and interpretations. Do not write in shaded parts of this data form. Answering some questions accurately may require conferring with the landowner or other knowledgable persons and/or reviewing aerial imagery. For most wetlands, completing this field data form will require 1-2 hours on a site. For a list of functions to which each question pertains, see the accompanying Interpretations form. For detailed descriptions of each WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage & Delay, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity, STR= Stressors.

,,	to die	Condition of t	D	Definition In 1
#	Indicators	Condition Choices	Data	Definitions/Explanations
1	Wetland Type	Follow the key below and mark the ONE row that best describes MOST of the vegetated part of the AA:		Ericaceous shrubs are ones in the heather family (Ericaceae). Most have leathery evergreen leaves. They include rhododendron, azalea, swamp laurel, leatherleaf, Labrador tea, and others. Most require
		A. Moss and/or lichen cover more than 25% of the ground. Often dominated by ericaceous shrubs (e.g., Labrador tea) or other acid-tolerant plants (e.g., bog cranberry, pitcher plant, sundew, orchids). Substrate is mostly undecomposed peat. Choose between A1 and A2 and mark the choice with a 1 in their adjoining column. Otherwise go to B below.		acidic soil. Although not in the family Ericaceae, sweetgale (<i>Myrica gale</i>) should be counted also. [AM, CS, FA, FR, INV, NR, OE, PH, Sens, SFS, WBF, WBN]
		A1. Surface water is usually absent or, if present, pH is typically <4.5 and conductivity is usually <100 µS/cm (<64 ppm TDS). Trees are absent or nearly so. Sedge cover usually sparse or absent but cottongrass and/or lichen cover may be extensive, as well as cloudberry, lingonberry, sheep laurel, and a sedge (<i>Carex rariflor</i> a). Welfand surface and surrounding landscape are seldom sloping and welfand often is domed (convex). Inlet and outlet channels are usually absent. If known, pH of peat is <4.0.	0	
		A2. Not A1. Surface water, if present, has pH typically >4.5 and conductivity is usually >100 µS/cm (>64 ppm TDS). Sedge cover is usually extensive, and/or tree and fall shrub cover is extensive. Sometimes at toe of slope or edge of water body. An exit channel is usually present. Wetter than A1 and peat depth may be shallower (<2 m).	0	
		B. Moss and/or lichen cover less than 25% of the ground. Soil is mineral or decomposed organic (muck). Choose between B1 and B2 and mark the choice with a 1 in their adjoining column:		
		B1. Trees and shrubs taller than 1 m comprise more than 25% of the vegetated cover. Surface water is mostly absent or inundates the vegetation only seasonally (e.g., vernal pools or floodplain).	1	
		B2. Not B1. Tree & tall shrubs comprise less than than 25% of the vegetated cover. Vegetation is mostly herbaceous, e.g., cattail, bulrush, burreed, pond lily, horsetail. Surface water may be extensive and fluctuates seasonally, being either persistent or drying up partly or entirely.	0	
AA sh nclud ' adja lescn	ould also include part of it the open water part adj cent " is used synonymou bed features along their it	the AA should include all persistent waters in ponds smaller than 8 hectares (-283 m on a side) that are adjacent to the AA. The the water area of adjacent ponded water larger than 8 ha and adjacent rivers wider than 20 m. Specifically, the AA should [acent to wetland vegetation and equal in width to the average width of that vegetated zone. Throughout this data form, usly with abutting, adjoining, bordering, contiguous and means no upland (manmade or natural) completely separates the directly shared edge. Features joined only by a channel are not necessarily considered to be adjacent a large portion of their res do not have to be hydrologically connected in order to be considered adjacent.		
2	Wetland Types - Adjoining or Subordinate	If the AA is smaller than 1 ha, mark all other types that occupy more than 1% of the vegetated AA. If the AA is larger than 1 ha, mark all other types which are within or adjacent to the AA and occupy more than 1 ha, as visible from the AA or as interpreted from aerial imagery. Do not mark again the type marked in F1.		1 hectare is 10,000 sq. m or about 2.5 acres. It could have dimensions of 100 m by 100 m, 1000 m by 10 m, or similar. [AM, INV, SBM, WBF]
		A1. A2.	0	
		B1.	0	
2	Woody Height & Form	B2. Following EACH row below, indicate with a number code the percentage of the living vegetation in the AA which is occupied by that feature (6	0	Deciduous shrubs in this region usually include buttonbush, Labrador tea, bayberry (Morella),
3	Diversity	if >95%, 5 if 75-95%, 4 if 50-75%, 3 if 25-50%, 2 if 5-25%, 1 if <5%, 0 if none). If the vegelated part of the AA is largely herbaceous (non-woody) vegetation, these percentages should not sum to 100%.	-	Decladous structs in this region tostady include duttinitions, Labriator lea, adjecting (worked), huckleberry, cranberry, cloudberry, sweetlgale, alder, willow, birch, ash, dogwood, and a few others. If you assigned a code of 3 or higher to any of the first four choices and the ground cover beneath the trees/shrubs is <25% moss, then question F1 might be "B1". [CS, INV, NR, PH, POL, SBM, Sens]
		coniferous trees (may include tamarack) taller than 3 m. deciduous trees taller than 3 m.	5 1	
		coniferous or ericaceous shrubs or trees 1-3 m tall not directly below the canopy of trees.	1	
		deciduous shrubs or trees 1-3 m tall not directly below the canopy of trees. coniferous or ericaceous shrubs <1 m tall not directly below the canopy of taller vegetation.	2	
		deciduous shrubs or trees <1 m tall (e.g., deciduous seedlings) not directly below the canopy of taller vegetation.	2	
lote :	If none of top 4 rows in	F3 was marked 2 or greater , SKIP to F9 (N fixers).		
4	Dominance of Most Abundant Shrub	Determine which two woody plant species comprise the greatest portion of the low (<3 m) woody cover . Then choose one:		[PH, POL, SBM, Sens]
	Species	those species together comprise > 50% of such cover. those species together do not comprise > 50% of such cover.	0	
5	Woody Diameter Classes	Mark ALL the yes that comprise >5% of the woody canopy cover in the AA or >5% of the wooded areas (if any) along its upland edge (perimeter). The edge should include only the trees whose canopies extend into the AA.	Ü	Estimate the diameters at chest height. If small-diameter trees are overlopped (shaded) by larger ones, visualise a "subcanopy" at the average height of the smaller-dbh trees, to serve as a basis for t
		coniferous, 1-9 cm diameter and >1 m tall. broad-leaved deciduous 1-9 cm diameter and >1 m tall.	1	minimum 5% canopy requirement in this question. The trees and shrubs need not be wetland specie [AM, CS, POL, SBM, Sens, WBN]
		coniferous, 10-19 cm diameter.	1	
		broad-leaved deciduous 10-19 cm diameter.	1

FieldF form - Non-tidal Page 3 of 5

F37	Interspersion of	During most of the part of the growing season when water is present, the spatial pattern of emergent vegetation within the water is mostly:		[AM, FA, FR, INV, NR, OE, PH, PR, SBM, SR, WBF, WBN]
	Emergents & Open Water	Scattered. More than 30% of such vegetation forms small islands or corridors surrounded by water.	0	
	water	Intermediate.	0	
		Clumped. More than 70% of such vegetation is in bands along the wetland perimeter or is clumped at one or a few sides of the surface water area.	0	
F38	Persistent Deepwater	If the deepest paich of surface water (flowing or ponded) in or directly adjacent to the AA is mostly deeper than 0.5 m for >2 weeks during the growing season, enter *1* and continue. If not, enter *0* and SKIP to F42 (Connection).	0	
F39	Area Non-vegetated Aquatic	During most of the growing season and in waters deeper than 0.5 m, the cover for fish, aquatic invertebrates, and/or amphibians that is		For this question, consider only the wood that is at or above the water surface. Estimates of underwater
	Cover	provided NOT by living vegetation, but by accumulations of dead wood and undercut banks is:		wood based only on observations from terrestrial viewpoints are unreliable so should not be attempted. [AM, FA, FR, INV]
		Little or none. Intermediate.	0	[Pag, 17, 115, 114]
E40	In elekt of feles of	Extensive.	0	DAMAN
F40	Isolated Island	The AA contains (or is part of) an island or beaver lodge within a lake, pond, or river, and is isolated from the shore by water depths > 1 m on all sides during an average June. The island may be solid, or it may be a floating vegetation mat that is sufficiently large and dense to support a waterbird nest.	0	[WBN]
	Duckweed	At some time of the year, mats of algae and/or duckweed are likely to cover >50% of the AA's otherwise-unshaded water surface, or blanket >50% of the underwater substrate. If true, enter "1" in next column. If untrue or uncertain, enter "0".	0	[EC, PR, WBF]
F42	Channel Connection & Outflow Duration	The most persistent surface water connection (outlet channel or pipe, ditch, or overbank water exchange) between the AA and a downslope stream network is: [Note: If the AA represents only part of a welland, answer this according to whichever is the least permanent surface connection: the one between the AA and the rest of the wetland, or the surface connection between the wetland and the downslope stream network.] Persistent (surface water flows out for >9 months/year).	0	Consider the connection regardless of whether the surface water is frozen. The "downslope stream network" could consist of ditches, rivers, ponds, or lakes which eventually connect to the ocean. If this cannot be determined while visiting the AA, consult topographic maps perhaps by viewing these online with Toporama (http://atlas.nrcan.gc.ca/toporama/en/index.html) [CS, FA, FR, NR, OE, PR, Sens, SFS SR, WCv, WS]
		Seasonal (surface water flows out for 14 days to 9 months/year, not necessarily consecutive).	1	
		Temporary (surface water flows out for <14 days, not necessarily consecutive). None but maps show a stream network downslope from the AA and within a distance that is less than the AA's length. SKIP to F47 (pH	0	
		Measurement).		
		No surface water flows out of the wetland except possibly during extreme events (<once (ph="" 10="" a="" an="" ditch,="" f47="" flows="" into="" lacks="" lake="" measurement).<="" only="" or="" or,="" outlet.="" per="" skip="" td="" that="" to="" water="" wetland,="" years).=""><td>0</td><td></td></once>	0	
F43	Outflow Confinement	During major runoff events, in the places where surface water exits the AA or connected waters nearby, the water:	Ŷ	"Major runoff events" would include biennial high water caused by storms and/or rapid snowmelt. [CS, NR, OE, PR, Sens, SR, STR, WS]
		Mostly passes through a pipe, culvert, narrowly breached dike, berm, beaver dam, or other partial obstruction (other than natural topography) that does not appear to drain the wetland artificially during most of the growing season.	0	
		Leaves through natural exits (channels or diffuse outflow), not mainly through artificial or temporary features. Is exported more quickly than usual due to ditches or pipes within the AA or connected to its outlet, or within 10 m of the AA's edge, which	0	
F44		drain the wetland artificially, or water is pumped out of the AA.	Ü	
F44	Tributary Channel	At least once annually, surface water from a tributary channel that is >100 m long moves into the AA. Or, surface water from a larger permanent water body adjacent to the AA spills into the AA. If it enters only via a pipe, that pipe must be fed by a mapped stream or lake further upslope. If no, SKIP to F47 (pH Measurement).	0	If inlet tributaries cannot be searched for due to inaccessibility of part of the AA, follow suggestions in F42 above. [NRv, PH, PRv, SRv]
F45	Input Water Temperature	Based on lack of shade, water source characteristics, or actual temperature measurements, the inflow is likely to be warmer than surface water in the AA during part of most years. Enter 1= yes, 0= no.	0	[WCv]
F46	Throughflow	During its travel through the AA at the time of peak annual flow, water arriving in channels: [select only the ONE encountered by most of the incoming water].		[FA, FR, INV, NR, OE, PR, SR, WS]
	Resistance	Does not bump into many plant stems as it travels through the AA. Nearly all the water continues to travel in unvegetated (often incised) channels that have minimal contact with wetland vegetation, or through a zone of open water such as an instream pond or lake.	0	
			_	
		Bumps into herbaceous vegetation but mostly remains in fairly straight channels. Bumps into herbaceous vegetation and mostly spreads throughout, or is in widely meandering, multi-branched, or braided channels.	0	
		Bumps into tree trunks and/or shrub stems but mostly remains in fairly straight channels.	0	
		Bumps into tree trunks and/or shrub stems and follows a fairly indirect path from entrance to exit (meandering, multi-branched, or braided).	0	
F47	pH Measurement	The pH in most of the AA's surface water:		Preferably, measure this in larger areas of ponded surface water within the AA, or in streams that have
		Was measured, and is: [enter the reading in the column to the right.]		passed through (not along) most of the AA. Unless surface water is completely absent, do not dig holes or make depressions in peat in order to provide water for this measurement. Avoid measuring near
		Was not measured but surface water is present and is darkly tea-coloured. Or if no surface water, then mosses and plants that indicate pealland (e.g., Labrador tea) are prevalent. Enter *11. Neither of above. Enter *11.	0	roads or in puddles formed only by recent rain. [AM, FA, FR, NR, WBF, PH, PR, Sens, WBF, WBN]
F48	TDS and/or	The TDS (total dissolved solids) or conductivity off the AA's surface water is: (select the first true row with information):		See above for measurement guidance. [FR, INV, NRv, PH, PRv, Sens]
	Conductivity	TDS is: [Enter the reading in ppm or mg/L in the column to the right, if measured, or answer next row.]		
		Conductivity is [Enter the reading in µS/cm in the column to the right.] Was not measured, but plants that indicate saline conditions cover much of the vegetated AA. Enter *1*.	0	
		Neither of above	1	
F49	Beaver Probability	Use of the AA by beaver during the past 5 years is (select most applicable ONE):	0	[FA, FR, PH, SBM, Sens, WBF, WBN]
		Evident from direct observation or presence of gnawed limbs, dams, tracks, dens, lodges, or extensive stands of water-killed trees (snags).	0	
		Likely based on known occurrence in the region and proximity to suitable habitat, which may include: (a) a persistent freshwater wetland, pond, or lake, or a perennial low or mid-gradient (<10%) channel, and (b) a corridor or multiple stands of hardwood trees and shrubs in vegetated areas near surface water.	0	
FEO	Croundy-t C:	Unlikely because site characteristics above are deficient, and/or this is a settled area or other area where beaver are routinely removed.	1	Adhere to there exists existing strictly do not we record induced to the control of the control
F50	Groundwater Strength of Evidence	Select first applicable choice: Springs are known to be present within the AA, or if groundwater levels have been monitored, that has demonstrated that groundwater primarily discharges to the wetland for longer periods during the year than periods when the wetland recharges the groundwater.	0	Adhere to these criteria strictly do not use personal judgment based on fen conditions, pH, or other evidence. Consult loggraphic maps to detect breaks in slope described here. Rust deposits associated with groundwater seeps may be most noticeable as orange discoloration in ice formations along streams during early winter. [AM, CS, FA, FR, INV, NR, CB, PH, PRV, SFS, WC, WS]
		Most of the AA has a slope of >5%, or is very close to the base of a natural slope longer than 100 and much steeper than the slope of the AA, AND the pH of surface water, if known, is >5.5.	0	
FE1	Internal Cradinat	Neither of above is true, although some groundwater may discharge to or flow through the AA. Or groundwater influx is unknown.	1	This is not the come as the charaline clane. It is the about 125
F51	Internal Gradient	The gradient along most of the flow path within the AA is: < or the AA has no surface water outlet (not even seasonally).	1	This is not the same as the shoreline slope. It is the elevational difference between the AA's inlet and outlet, divided by the flow-distance between them and converted to percent. If available, use a
		4. Or the AA has no surface water outlet (not even seasonally). 2-5%.	0	clinometer to measure this. Free clinometer apps can be downloaded to smartphones. If the wetland is large (longer than -1 km), this may be estimated using Google Earth to determine the minimum and
		6-10%. >10%.	0	maximum elevation within the AA, then dividing by length and multiplying by 100. [CS, NR, OE, PR, SR, WBF, WBN, WS]
Note fo	or the next three quest	>10%. ions: If the AA lacks an upland edge, evaluate based on the AA's entire perimeter, and moving outward into whatever areas are	0	ן אינון אינון, אינון
adjacei	nt. In many situations, th	nese questions are best answered by measuring from aerial images.		TAM FA FD INV NDv DH DOL DDv CDM Cone CDv CTD M/DMI
F52	Vegetated Buffer as % of Perimeter	Within a zone extending 30 m laterally from the AA's edge with upland and/or other wetlands, the percentage that contains perennial vegetation cover (except lawns, row crops, heavily grazed land, conifer plantations) is:		[AM, FA, FR, INV, NRv, PH, POL, PRv, SBM, Sens, SRv, STR, WBN]
		<5%.	0	
		5 to 30%. 30 to 60%.	0

NOTE: A score of 0 does not mean the function or benefit is absent from the wetland. It means only that this wetland has a capacity that is equal or less than the lowest-scoring one, for that function or benefit, from among the 98 NB calibration wetlands that were assessed previously.

Cover Page: Basic Description of Assessment	WESP-AC version 2
Site Name:	Burchill Wind Energy Project - MCB2-W-03
Investigator Name:	Derrick Mitchell
Date of Field Assessment:	10 September 2020
Nearest Town:	Lorneville (west Saint John), New Brunswick
Latitude (decimal degrees):	45.161926
Longitude (decimal degrees):	-66.191334
Is a map based on a formal on-site wetland delineation available?	Yes
Approximate size of the Assessment Area (AA, in hectares):	0.67
AA as percent of entire wetland (approx.). Attach sketch map if AA is smaller than the entire contiguous wetland.	
What percent (approx.) of the wetland were you able to visit?	100
What percent (approx.) of the AA were you able to visit?	
Were you able to ask the site owner/manager about any of the questions?	
Indicate here if you intentionally surveyed for rare plants, calciphile plants, or rare animals	
Have you attended a WESP-AC training session? If so, indicate approximate month & year	
How many wetlands have you assessed previously using WESP-AC? (approx.)	100+
Comments about the site or this WESP-AC assessment (attach extra page if desired):	

Form OF (Office). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Conduct an assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answering many of the questions below will require using these online map viewers:

Google Earth Pro: https://www.google.com/earth/download/gep/agree.html

GeoNB: http://www.snb.ca/geonb1/ and http://www.snb.ca/geonb1/e/apps/apps-E.asp

For most wetlands, completing this office data form will require 1-2 hours. For a list of functions to which each question pertains, see bracketed abbreviations in the Definitions/Explanations column. For detailed descriptions of each WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, PO= Pollinator Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity, STR= Stressors.

F1	Indicators	Condition Choices	Data	Definitions/Explanations
	Province	Mark the province in which the AA is located by changing the 0 in the column next to it to a *1". Mark only one.		This determines to which province's calibration wetlands the raw score of any wetland is normalise
		New Brunswick	1	In the function and benefits models, it also triggers the automatic exclusion of indicators for which spatial data exists in a particular province.
		Nova Scotia	0	spatial data exists in a particular province.
		Prince Edward Island	0	
		Newfoundland-Labrador	0	
2	Ponded Area Within 1 km.	The area of surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) within 1 km is:		"Adjacent" means not separated from the AA by a wide expanse (>50 m) of upland (including rox >50 m wide). Include ponded areas likely to be hidden by wetland vegetation. If surface water
		<0.01 hectare (about 10 m x 10 m).	0	extends beyond 1 km, include only the part within 1 km. Do not include tidal areas. Measure the
		0.01 - 0.1 hectare.	0	from aerial imagery using Google Earth Pro (click on Ruler icon in toolbar, then Polygon in pop-up
		0.1 - 1 hectare.	0	menu). With the GeoNB viewer, enable the Wetlands layer, then measure with the Draw & Meass tool after specifying Aerial as the Basemap. However, do not rely entirely on wetland boundaries
		1 to 10 hectares.	1	shown in online wetlands layers. [PH, SBM, WBN]
		10 to 100 hectares.	0	, , , , , , , , , , , , , , , , , , ,
		>100 hectares.	0	
3	Ponded Water & Wetland Within 1 km.	The area of wetlands and surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) within 1 km is:	1	See definition of adjacent in OF2. If the AA's wetland vegetation extends beyond 1 km, include o the part within 1 km. "Ponded" means not flowing in rivers or streams. [Sens, WBF]
		<0.01 hectare (about 10 m x 10 m).	0	
		0.01 - 0.1 hectare.	0	
		0.1 - 1 hectare.	0	
		1 to 10 hectares.	1	
		10 to 100 hectares.	0	
		>100 hectares.	0	
4	Size of Largest Nearby Vegetated Tract or	The largest vegetated patch or corridor that includes the AA's vegetation plus aladjacent upland vegetation that is not lawn, row crops, neavily grazed lands, conifer plantation is:		See definition of adjacent in OF2. Use Google Earth Pro's polygon ruler (as described above). Exclude conifer plantations only if it is obvious that trees were planted in rows. [AM, PH, SBM, Se
	Corridor	<0.01 hectare (about 10 m x 10 m).	0	
		0.01 - 0.1 hectare.	0	
		0.1 - 1 hectare.	0	
		1 to 10 hectares.	0	
		10 to 100 hectares.	0	
		100 to 1000 hectares.	0	
		>1000 hectares. [This is nearly always the answer in relatively undeveloped landscapes]	1	
5	Distance to Large Vegetated Tract	The minimum distance from theedge of the AA to the edge of the closest vegetated land (but excluding row crops, lawn, conifer plantation) larger than 375 hectares (about 2 km on a side), is:		To measure distance, use Google Earth Pro (Ruler > Line tool). Or use Draw & Measure tool at GeoNB. The 375-ha criterion is from the Fundy Model Forest Project. [AM, PH, POL, SBM, Sen:
		<50 m, and not separated from the 375-ha vegetated area by any width opaved roads, stretches of open water, row crops, bare ground, lawn, or impervious surface. Or the AA itself contains >375 ha of vegetation. [This is often the answer in relatively undeveloped landscape	0 s.]	
		<50 m, but completely separated from the 375-ha vegetated area by those features, and AA does not contain >375 ha of vegetation.	0	
		50-500 m, and not separated.	0	
		50-500 m, but separated by those features.	1	
		0.5 - 5 km, and not separated.	0	
		0.5 - 5 km, but separated by those features.	0	
		None of the above (the closest patches or corridors which are that large are >5 km away).	0	
6	Herbaceous Uniqueness	The AA's vegetation cover is >10% herbaceous* but uplands within 5 km have <10% herbaceous cover. If so, enter "3" and continue to OF7. If not, consider: The AA's vegetation cover is >10% herbaceous* but uplands within 1 km have <10% herbaceous cover. If so enter "2" and continue to OF7. If not, consider: The AA's vegetation cover is >10% herbaceous* but uplands within 100 m of the wetland edge have <10% herbaceous cover. If so, enter "1". "NOTE: Exclude lawns, row crops, heavily grazed lands, forest, shrublands. Include moss as well as grasslike plants in this use of "herbaceous vegetation"]	1	For this question only, consider moss to be herbaceous vegetation. Determine the score by view areal imagery in Google Earth after successively drawing or estimating the boundaries of the but of 5 km, 1 km, and 100 m radius focused on the center of the AA. Circles of specified radius can drawn in Google Earth Pro by clicking on the Ruler icon, then Circle in the pop-up menu. [AMv, F POLv, SBMv, WBFv, WBNv]
•	Woody Uniqueness	The AA's vegetation cover is >10% woody* but uplands within 5 km have <10% woody cover. If so, enter "3" and continue to OF8. If not,	1	See above. Do not consider conifer plantations to be forest if it is obvious that trees were planted
7		consider: The AA's vegetation is >10% woody" but uplands within 1 km have <10% woody cover. If so enter "2" and continue to OF8. If not, consider:		rows. [AMv, PHv, POLv, SBMv]
7				
7		The AA's vegetation is >10% woody" but uplands within 100 m of the wetland edge have <10% woody cover. If so, enter "1" [" NOTE: woody cover = trees & shrubs taller than 1 m.]		
	Local Vegetated Cover Percentage			In Google Earth, draw the 5 km buffer and then estimate land cover percentages, or do GIS analy of an appropriate land cover layer. [AM, PH, POL, SBM, Sens]
		[* NOTE: woody cover = trees & shrubs taller than 1 m.] Draw a 5-km radius circle measured from the center of the AA. Ignoring all permanent water in the circle, the percent of the remaining are		
		NOTE: woody cover = trees & shrubs taller than 1 m.] Draw a 5-km radius circle measured from the center of the AA. 0545	Tidal Davida "	>10 km.	0	Cook Falls and the distance to the cook of
JF 15	Tidal Proximity	The distance from the AA edge to the closesttidal water body (regardless of its salinity) is:		In Google Earth, measure the distance to the ocean (including Bay of Fundy) or tidal river, whicheve is closer. If you need to see how far upriver a river is tidal, see the KMZ file provided with this
		<100 m.	0	calculator for NB (NB Headtide). Points shown in those files are only an approximation, so local
		100 m - 1 km. 1 - 5 km.	0	information if available may be preferable. [FA, WBF]
		5-10 km.	0	1
		10-40 km.	0	
		>40 km.	0	
OF16	Upland Edge Contact	Select one:		[NR, SBM, Sens]
		The AA has no upland edge (or upland is <1% of perimeter). The AA is entirely surrounded by (& contiguous with) other wetlands or water	0	
		1.25% of the AA's perimeter abuts upland (including filled areas). The rest adjoins other wetlands or water that is mostly wider than the AA 25-50% of the AA's perimeter abuts upland. The rest adjoins other wetlands or water that is mostly wider than the AA.	0	
		50-75% of the AA's perimeter abuts upland. The rest adjoins other wetlands or water that is mostly wider than the AA.	0	
		More than 75% of the AA's perimeter abuts upland. Any remainder adjoins other wetlands or water that is mostly wider than the AA.This	1	
0517	Claud Danson from Nam	will be true for most assessments done with WESP-AC.		In the Coalification of the State of the Sta
OF I /	tidal Waters	Within 5 km downstream or downslope of the AA (select first true choice):		In the GeoNB map viewer: click on "More" in upper right, then "Flood Information". Expand the mer under it by clicking on the arrow to its left and the slider to its right. Uncheck the first (Limits of Data
		Maps show Flood Zone or Flood Risk areas and there appears to be infrastructure vulnerable to river flooding not caused by tidal storm surges. Maps show Flood Zone or Flood Risk areas, but infrastructure is absent or is not vulnerable to floods from a non-lidal river. In some cases	0	box. Where available, LiDAR imagery can provide finer elevational resolution useful for flood modeling. [WSv]
		evees, upriver dams, or other measures may partly limit damage or risk from smaller events. Maps do not show Flood Zone or Flood Risk areas for no such mapping has been done locally) and there appears to be infrastructure	0	
		vulnerable to river flooding unrelated to tidal storm surges. Maps do not show Flood Zone or Flood Risk areas (or no such mapping has been done locally) and there i no infrastructure vulnerable	1	
OF18	Relative Elevation in Watershed	o river flooding unrelated to tidal storm surges. In Google Earth, enable the Terrain layer (lower left menu) and open the NB_Watersheds KMZ file that accompanies this calculator. Then determine the AXS approximate elevation (bottom right, NOT the "eye alt"). Then move cursor around to determine the watershed's	0.35	[FA, NR, Sens, SFSv, WCv, WSv]
OF19	Water Quality Sensitive	maximum and minimum elevation. Divide the AA's elevation by the (max-min). In Google Earth, open the KMZ file NB_Watershed Protected Area which accompanies this calculator. The AA is within such an area.	0.33	If an ACCDC report is available for this AA, it also may contain such information. [NRv]
	Watershed or Area	Enter 1= yes, 0= no.		
OF20	Degraded Water Upstream	Sampling Indicates a problem with concentrations ofmetals, hydrocarbons, nutrients, or other substances (excluding bacteria, acidic water, high temperatures) being present at levels harmful to aquatic life or humans, and: The appelling is present within the A.A.	0	May use existing data, or sample those waters as part of this wetland assessment. "Harmful" shoul be evaluated with regard to current federal or provincial water quality standards. [AM, FA, FR, NRv PRv, SRv, STR, WBF, WBN]
		The condition is present within the AA. The condition is present in waters within 1 km that flowinto the AA, but has not been documented in the AA itself.	0	1
		Sampling during both low water periods and times with high runoff (storms, snowmelt) indicates no problems in either the AA or inflowing waters.	0	
		Data are insufficient (no or inadequate sampling within 1 km, or condition exists only at >1 km upstream)This is the situation for nearly all wetlands in this region.	1	
OF21	Degraded Water	The problem described above is downslope from the AA, and:		May use existing data, or monitor waters as part of this wetland assessment. [NRv, PRv, SRv]
	Downstream	The condition is present within 1 km downslope and connected to the AA by a channel.	0	1
		The condition is present within 5 km downslope and connected to the AA by a channel, or within 1 km but not connected to the AA by a channel.	0	
		Sampling during both low water periods and times with high runoff (storms, snowmelt) indicates no problems in either the AA or inflowing waters. Data are insufficient (no or inadequate sampling within 1 km, or condition exists only at >1 km upstream)This is the situation for nearly	0	
		all wetlands in this region.		
OF22	Wetland as a % of Its Contributing Area (Catchment)	From a topographic map and field observations, estimate the approximate boundaries of the catchment (CA) of the entire wetland of which AM may be only a part. Then adjust those boundaries if necessary based on your field observations of the surrounding and/or to using procedures described in the Manual. Divide the area of the wetland (not just the AA) by the approximate area of its catchment excluding the area of the wetland itself. When doing the calculation, if ponded water is adjacent to the wetland, include that in the wetland area. The result is:		Topographic maps may be viewed online at the National Atlas of Canada (Toporama): http://atlas.gc.ca/loporama/en/index.html [NR, PR, Sens, SR, WS]
		< 0.01, or catchment size unknown due to stormwater pipes that collect water from an indeterminate area. 0.01 to 0.1.	0	1
		0.1 to 1.	1	
OF22	Unwagatatad Curface In	11 (welland is larger than its catchment (e.g., welland with flat surrounding terrain and no inlet, or is entirely isolated by dikes, or is a raisee loog). 10 properties of the AA's contribution area (properties) to personal than 1,000 properties of the AA's contribution area (properties) to personal than 1,000 properties of the AA's contribution area (properties).	0	ICA IMV NDv DDv SDv STD WGv WSvi
	Unvegetated Surface in	The proportion of the AA's contributing area (measured to no more than 1000 m upslope) that is comprised of buildings, roads, parking lots other pavement, exposed bedrock, landslides, and other mostly-bare surface is about:		[FA, INV, NRv, PRv, SRv, STR, WCv, WSv]
UF23	the Contributing Area	<10%.	0	
UF23	the Contributing Area	<10%. 10 to 25%.	0	

DF24				
	Transport From Upslope	A relatively large proportion of the precipitation that falls farther upslope in the CA reaches this wetland quickly as runoff (surface water), as		[NRv, PRv, SRv, WSv]
		indicated by the following:		
		(a) input channel is present,		
		(b) input channels have been straightened,		
		(c) upslope wetlands have been ditched extensively,		
		(d) land cover is mostly non-forest, (e) CA slopes are steep, and/or		
		(f) most CA soils are shallow (bedrock near surface) and/or have high runoff coefficients.		
		This statement is:		
		The Salestian D.		
		Mostly true.	0	
		Somewhat true.	1	
		Mostly untrue.	0	
DF25	Aspect	The overland flow direction of most surface water (in streams, rivers, or runoff) that enters the AA is:		[AM, NR, SFS, WC, WS]
		Northward (N, NE). north-facing contributing area.	0	
		Southward (S, SW). south-facing contributing area.	1	
		Other (E, SE, W, NW), or no detectable uphill slope or input channel (flat).	'	
_				
)F26	Internal Flow Distance (Path Length)	The horizontal flow distance from the wetland's inlet to outlet is:		Identify inlets and outlets, if any, from topographic maps (use elevations to determine which are inle
	(Pain Lengin)	<10 m.	0	and which are outlets) and augment by field inspection. [NR, OE, PR, SR, WS]
		10 - 50 m.	0	
		50 - 100 m.	0	
		50 - 100 m. 100 - 1000 m.	1	
		1- 2 km.	0	
		>2 km, or wetland lacks an inlet and outlet.	0	
DF27	Growing Degree Days	In Google Earth, open the KMZ file that accompanies this calculator, called NB-PEI_GrowingDegreeDays. Place your cursor over the AA and left-click. From the pop-up, enter the GRIDCODE in the next column.	2428	This layer was provided by Dr. Dan McKenney of the Canadian Forest Service [AM, CS, FR, INV, NR, OE, PH, PR, Sens, SR, WBF, WCv, WS]
OF28	Fish Access or Use	According to agency biologists and/or your own observations, the AA. [Nark just the first choice that is true.]:		Regarding the last choice, if uncertain if an AA is fishless, consider the possibility its waters have be stocked. In NB, the list of stocked waters is at:
		Is known to support rearing and/or spawning by Atlantic salmon or other anadromous species or eels. In NB, consult Figure A-2 in	0	http://www2.gnb.ca/content/gnb/en/departments/erd/natural_resources/content/fish/content/Stocked
		Appendix A of the Manual. Contact local fishery biologists, review the ACCDC report, and visit these websites:		aters.html
		http://www.salmonatlas.com/atlanticsalmon/canada-east/index.1.html http://atlanticsalmonfederation.org/rivers/introduction.html		[AM, FA, FR, INV, WBF, WBN]
		Has not been documented to support Atlantic salmon rearing and/or spawning, but is connected to nearby waters likely to contain Atlantic	0	
		salmon or other anadromous species or eels and is probably accessed by those during some conditions.		
		Is probably is not accessed by any anadromous fish species but is known or likely to havether fish at least seasonally.	0	
		Is known or likely to be fishless (e.g., too small, dry, and/or not accessible even temporarily, and not stocked).	1	
DF29	Species of Conservation	Within the past 10 years, in the AA (or in its adjoining waters or wetland), qualified observers have documented mark all applicable:		Request information from ACCDC and/or conduct your own survey at an appropriate season using a
	Concern			approved protocol. For birds, also check eBird.org. [AMv, EC, PHv, POLv, SBMv, Sens, WBFv,

Date: 10 September 2020 Site Identifier: MCB2-W-03 Investigator: Derrick Mitcl

Form F (Field). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Walk for no less than 10 minutes from the wetland edge towards its core, in the part of the AA that is proposed for alteration. If no alteration is proposed, walk in a portion that appears to be most representative of the wetland overall. Walk only where it is safe and legal to do so. Conduct the assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answer these questions primarily based on your onsite observations and interpretations. Do not write in shaded parts of this data form. Answering some questions accurately may require conferring with the landowner or other knowledgable persons and/or reviewing aerial imagery. For most wetlands, completing this field data form will require 1-2 hours on a site. For a list of functions to which each question pertains, see the accompanying Interpretations form. For detailed descriptions of each WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage & Delay, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity, STR= Stressors.

	to disease on	Condition Chaires	D-4-	Definition / Fundament
#	Indicators	Condition Choices	Data	Definitions/Explanations
-1	Wetland Type	Follow the key below and mark the ONE row that best describes MOST of the vegetated part of the AA:		Ericaceous shrubs are ones in the heather family (Ericaceae). Most have leathery evergreen leaves. They include rhododendron, azalea, swamp laurel, leatherleaf, Labrador tea, and others. Most require
		A. Moss and/or lichen cover more than 25% of the ground. Often dominated by ericaceous shrubs (e.g., Labrador tea) or other acid-tolerant plants (e.g., b.og cranberry, pitcher plant, surdew, orchicls). Substrate is mostly undecomposed peat. Choose between A1 and A2 and mark the choice with a 1 in their adjoining column. Otherwise go to B below.		acidic soil. Although not in the family Ericaceae, sweetgale (Myrica gale) should be counted also. [AM, CS, FA, FR, INV, NR, OE, PH, Sens, SFS, WBF, WBN]
		A1. Surface water is usually absent or, if present, pH is typically <4.5 and conductivity is usually <100 µS/cm (<64 ppm TDS). Trees are absent or nearly so. Sedge cover usually sparse or absent but cottongrass and/or lichen cover may be extensive, as well as cloudberry, lingonberry, sheep laurel, and a sedge (Carex rariflora). Welfand surface and surrounding landscape are seldom sloping and welfand often is domed (convex). Inlet and outlet channels are usually absent. If known, pH of peat is <4.0.	0	
		A2. Not A1. Surface water, if present, has pH typically >4.5 and conductivity is usually >100 µS/cm (>64 ppm TDS). Sedge cover is usually extensive, and/or tree and tall shrub cover is extensive. Sometimes at toe of slope or edge of water body. An exit channel is usually present. Wetter than A1 and peat depth may be shallower (<2 m).	0	
		B. Moss and/or lichen cover less than 25% of the ground. Soil is mineral or decomposed organic (muck). Choose between B1 and B2 and mark the choice with a 1 in their adjoining column:		
		B1. Trees and shrubs taller than 1 m comprise more than 25% of the vegetated cover. Surface water is mostly absent or inundates the vegetation only seasonally (e.g., vernal pools or floodplain).	0	
		B2. Not B1. Tree & tall shrubs comprise less than than 25% of the vegetated cover. Vegetation is mostly herbaceous, e.g., cattail, bulrush, burreed, pond lily, horsetail. Surface water may be extensive and fluctuates seasonally, being either persistent or drying up partly or entirely.	1	
		the AA should include all persistent waters in ponds smaller than 8 hectares (~283 m on a side) that are adjacent to the AA. The		
includ " adja descn	e the open water part adj cent " is used synonymo bed features along their i	the water area of adjacent ponded water larger than 8 ha and adjacent rivers wider than 20 m. Specifically, the AA should jacent to wetland vegetation and equal in width to the average width of that vegetated zone. Throughout this data form, usly with abutting, adjoining, bordering, contiguous and means no upland (manmade or natural) completely separates the directly shared edge. Features joined only by a channel are not necessarily considered to be adjacent a large portion of their res do not have to be hydrologically connected in order to be considered adjacent.		
2	Wetland Types - Adjoining or Subordinate	If the AA is smaller than 1 ha, mark all other types that occupy more than 1% of the vegetated AA. If the AA is larger than 1 ha, mark all other types which are within or adjacent to the AA and occupy more than 1 ha, as visible from the AA or as interpreted from aerial imagery. Do not mark again the type marked in F1.		1 hectare is 10,000 sq. m or about 2.5 acres. It could have dimensions of 100 m by 100 m, 1000 m by 10 m, or similar. [AM, INV, SBM, WBF]
		A1.	0	
		A2. B1.	0	
		B2.	0	
3	Woody Height & Form Diversity	Following EACH row below, indicate with a number code the percentage of the living vegetation in the AA which is occupied by that feature (6 if >95%, 5 if 75-95%, 4 if 50-75%, 3 if 25-50%, 2 if 5-25%, 1 if <5%, 0 if none). If the vegetated part of the AA is largely herbaceous (non-woody) vegetation, these percentages should not sum to 100%.		Deciduous shrubs in this region usually include buttonbush, Labrador tea, bayberry (Morella), huckleberry, cranberry, cloudberry, sweetgale, alder, willow, birch, ash, dogwood, and a few others. If you assigned a code of 3 or higher to any of the first four choices and the ground cover beneath the trees/shrubs is <25% moss, then question FT might be "B1". [CS, INV, NR, PH, POL, SBM, Sens]
		coniferous trees (may include tamarack) taller than 3 m. deciduous trees taller than 3 m.	0	accessing to the second
		coniferous or ericaceous shrubs or trees 1-3 m tall not directly below the canopy of trees.	0	
		deciduous shrubs or trees 1-3 m tall not directly below the canopy of trees.	5	
		coniferous or ericaceous shrubs <1 m tall not directly below the canopy of taller vegetation. deciduous shrubs or trees <1 m tall (e.g., deciduous seedlings) not directly below the canopy of taller vegetation.	0	
<u>Note</u> :		F3 was marked 2 or greater , SKIP to F9 (N fixers).		
4	Dominance of Most Abundant Shrub	Determine which two woody plant species comprise the greatest portion of the low (<3 m) woody cover . Then choose one:		[PH, POL, SBM, Sens]
	Species	those species together comprise > 50% of such cover. those species together do not comprise > 50% of such cover.	0	
5	Woody Diameter Classes	Mark ALL the types that comprise >5% of the woody canopy cover in the AA or >5% of the wooded areas (if any) along its upland edge (perimeter). The edge should include only the trees whose canopies extend into the AA.	Ü	Estimate the diameters at chest height. If small-diameter trees are overtopped (shaded) by larger ones, visualise a "subcanopy" at the average height of the smaller-dbh trees, to serve as a basis for th
		coniferous, 1-9 cm diameter and >1 m tall.	0	minimum 5% canopy requirement in this question. The trees and shrubs need not be wetland species. [AM, CS, POL, SBM, Sens, WBN]
		broad-leaved deciduous 1-9 cm diameter and >1 m tall. coniferous, 10-19 cm diameter.	0	[Mill, CS, FOE, Sbill, Sells, Wbill]
		broad-leaved deciduous 10-19 cm diameter.	1	
		coniferous, 20-40 cm diameter.	0	
		broad-leaved deciduous 20-40 cm diameter. coniferous, >40 cm diameter.	0	
		broad-leaved deciduous >40 cm diameter.	0	
	Height Class	Follow the key below and mark the ONE row that best describes MOST of the AA:		[AM, INV, NR, PH, SBM, Sens]
6	Interspersion	A. Neither the vegetation taller than 1 m nor the vegetation shorter than that comprise >70% of the vegetated part of the AA. They each		
6		comprise 30-70%. Choose between A1 and A2 and mark the choice with a 1 in the adjoining column. Otherwise go to B below.		
6		A1. The two height classes are mostly scattered and intermixed throughout the AA.	0	
6		, , ,	0	
6		A1. The two height classes are mostly scattered and intermixed throughout the AA. A2. Not A1. The two height classes are mostly in separate zones or bands, or in proportionately large clumps. B. Either the vegetation shorter than 1 m comprises > 70% of the vegetated part of the AA, or the vegetation taller than that does. One size class might even be totally absent. Choose between B1 and B2 and mark the choice with a 1 in the adjoining column: B1. The less prevalent height class is mostly scattered and intermixed within the prevalent one. B2. Not B1. The less prevalent height class is mostly located apart from the prevalent one, in separate zones or clumps, or is completely		
-7	Large Snags (Dead	A1. The two height classes are mostly scattered and intermixed throughout the AA. A2. Not A1. The two height classes are mostly in separate zones or bands, or in proportionately large clumps. B. Either the vegetation shorter than 1 m comprises >70% of the vegetated part of the AA, or the vegetation taller than that does. One size class might even be totally absent. Choose between B1 and B2 and mark the choice with a 1 in the adjoining column: B1. The less prevalent height class is mostly scattered and intermixed within the prevalent one.	0	
7	Large Snags (Dead Standing Trees)	A1. The two height classes are mostly scattered and intermixed throughout the AA. A2. Not A1. The two height classes are mostly in separate zones or bands, or in proportionately large clumps. B. Either the vegetation shorter than 1 m comprises >70% of the vegetated part of the AA, or the vegetation taller than that does. One size class might even be totally absent. Choose between B1 and B2 and mark the choice with a 1 in the adjoining column: B1. The less prevalent height class is mostly scattered and intermixed within the prevalent one. B2. Not B1. The less prevalent height class is mostly located apart from the prevalent one, in separate zones or clumps, or is completely absent. The number of large snags (diameter >20 cm) in the AA plus adjacent upland area within 10 m of the wetland edge is: None, or fewer than 8/ hectare which exceed this diameter.	0 1 0	Snags are dead standing trees that often (not always) lack bark and foliage. Include only ones that are at least 2 m tall. [POL, SBM, WBN]
77		A1. The two height classes are mostly scattered and intermixed throughout the AA. A2. Not A1. The two height classes are mostly in separate zones or bands, or in proportionately large clumps. B. Either the vegetation shorter than 1 m comprises >70% of the vegetated part of the AA, or the vegetation taller than that does. One size class might even be totally absent. Choose between B1 and B2 and mark the choice with a 1 in the adjoining column: B1. The less prevalent height class is mostly scattered and intermixed within the prevalent one. B2. Not B1. The less prevalent height class is mostly located apart from the prevalent one, in separate zones or clumps, or is completely absent. FieldF form - Non-tidal Page 3 of 5

F37	Interspersion of	During most of the part of the growing season when water is present, the spatial pattern of emergent vegetation within the water is mostly:		[AM, FA, FR, INV, NR, OE, PH, PR, SBM, SR, WBF, WBN]
	Emergents & Open Water	Scattered. More than 30% of such vegetation forms small islands or corridors surrounded by water.	0	
	water	Intermediate.	0	
		Clumped. More than 70% of such vegetation is in bands along the wetland perimeter or is clumped at one or a few sides of the surface water area.	0	
F38	Persistent Deepwater	If the deepest patch of surface water (flowing or ponded) in or directly adjacent to the AA is mostly deeper than 0.5 m for >2 weeks during the	0	
F39	Area Non-vegetated Aquatic	growing season, enter "1" and continue. If not, enter "0" and SKIP to F42 (Connection). During most of the growing season and in waters deeper than 0.5 m, the cover for fish, aquatic invertebrates, and/or amphibians that is		For this question, consider only the wood that is at or above the water surface. Estimates of underwater
137	Cover	provided NOT by living vegetation, but by accumulations of dead wood and undercut banks is:		wood based only on observations from terrestrial viewpoints are unreliable so should not be attempted.
		Little or none. Intermediate.	0	[AM, FA, FR, INV]
		Extensive.	0	
F40	Isolated Island	The AA contains (or is part of) an island or beaver lodge within a lake, pond, or river, and is isolated from the shore by water depths >1 m on all sides during an average June. The island may be solid, or it may be a floating vegetation mat that is sufficiently large and dense to support a waterbird nest.	0	[WBN]
	Duckweed	Al some time of the year, mats of algae and/or duckweed are likely to cover >50% of the AA's otherwise-unshaded water surface, or blanket >50% of the underwater substrate. If true, enter "1" in next column. If untrue or uncertain, enter "0".	0	[EC, PR, WBF]
F42	Channel Connection & Outflow Duration	The most persistent surface water connection (outlet channel or pipe, dilct, or overbank water exchange) between the AA and a downslope stream network is: [Note: If the AA represents only part of a wetland, answer this according to whichever is the least permanent surface connection: the one between the AA and the rest of the wetland, or the surface connection between the wetland and the downslope stream network.] Persistent (surface water flows out for >9 months/year).	0	Consider the connection regardless of whether the surface water is frozen. The "downslope stream network" could consist of ditches, rivers, ponds, or lakes which eventually connect to the ocean. If this cannot be determined while visiting the AA, consult topographic maps perhaps by viewing these online with Toporama (http://atlas.nrcan.gc.ca/toporama/en/index.html) [CS, FA, FR, NR, OE, PR, Sens, SFS SR, WCV, WS]
		Seasonal (surface water flows out for 14 days to 9 months/year, not necessarily consecutive).	1	
		Temporary (surface water flows out for <14 days, not necessarily consecutive). None but maps show a stream network downslope from the AA and within a distance that is less than the AA's length. SKIP to F47 (pH	0	
		Measurement).		
		No surface water flows out of the welland except possibly during extreme events (<once (ph="" 10="" a="" an="" ditch,="" f47="" flows="" into="" lacks="" lake="" measurement).<="" only="" or="" or,="" outlet.="" per="" skip="" td="" that="" to="" water="" welland,="" years).=""><td>0</td><td></td></once>	0	
F43	Outflow Confinement	During major runoff events, in the places where surface water exits the AA or connected waters nearby, the water:		"Major runoff events" would include biennial high water caused by storms and/or rapid snowmelt. [CS, NR, OE, PR, Sens, SR, STR, WS]
		Mostly passes through a pipe, culvert, narrowly breached dike, berm, beaver dam, or other partial obstruction (other than natural topography) that does not appear to drain the wetland artificially during most of the growing season.	1	
		Leaves through natural exits (channels or diffuse outflow), not mainly through artificial or temporary features. Is exported more quickly than usual due to ditches or pipes within the AA or connected to its outlet, or within 10 m of the AA's edge, which	0	
544		drain the wetland artificially, or water is pumped out of the AA.	U	
F44	Tributary Channel	At least once annually, surface water from a tributary channel that is >100 m long moves into the AA. Or, surface water from a larger permanent water body adjacent to the AA spills into the AA. If it enters only via a pipe, that pipe must be fed by a mapped stream or lake further upslope. If no, SKIP to F47 (pH Measurement).	0	If inlet tributaries cannot be searched for due to inaccessibility of part of the AA, follow suggestions in F42 above. [NRv, PH, PRv, SRv]
F45	Input Water Temperature	Based on lack of shade, water source characteristics, or actual temperature measurements, the inflow is likely to be warmer than surface water in the AA during part of most years. Enter 1= yes, 0= no.	1	[WCv]
F46	Throughflow	During its travel through the AA at the time of peak annual flow, water arriving in channels: [select only the ONE encountered by most of the incoming water].		[FA, FR, INV, NR, OE, PR, SR, WS]
	Resistance	Does not bump into many plant stems as it travels through the AA. Nearly all the water continues to travel in unvegetated (often incised)	0	
		channels that have minimal contact with wetland vegetation, or through a zone of open water such as an instream pond or lake.		
		Bumps into herbaceous vegetation but mostly remains in fairly straight channels.	1	
		Bumps into herbaceous vegetation and mostly spreads throughout, or is in widely meandering, multi-branched, or braided channels.	0	
		Bumps into tree trunks and/or shrub stems but mostly remains in fairty straight channels. Bumps into tree trunks and/or shrub stems and follows a fairty indirect path from entrance to exit (meandering, multi-branched, or braided).	0	
F47	pH Measurement	The pH in most of the AA's surface water:		Preferably, measure this in larger areas of ponded surface water within the AA, or in streams that have passed through (not along) most of the AA. Unless surface water is completely absent, do not dig holes
		Was measured, and is: [enter the reading in the column to the right.] Was not measured but surface water is present and is darkly tea-coloured. Or if no surface water, then mosses and plants that indicate	0	or make depressions in peat in order to provide water for this measurement. Avoid measuring near
		peatland (e.g., Labrador tea) are prevalent. Enter "1".	0	roads or in puddles formed only by recent rain. [AM, FA, FR, NR, WBF, PH, PR, Sens, WBF, WBN]
F48	TDS and/or	Neither of above. Enter "1". The TDS (total dissolved solids) or conductivity off the AA's surface water is: (select the first true row with information):		See above for measurement guidance. [FR, INV, NRv, PH, PRv, Sens]
	Conductivity	TDS is: [Enter the reading in ppm or mg/L in the column to the right, if measured, or answer next row.]		
		Conductivity is [Enter the reading in µS/cm in the column to the right.]		
		Was not measured, but plants that indicate saline conditions cover much of the vegetated AA. Enter *1". Neither of above	0	
F49	Beaver Probability	Use of the AA by beaver during the past 5 years is (select most applicable ONE):		[FA, FR, PH, SBM, Sens, WBF, WBN]
		Evident from direct observation or presence of gnawed limbs, dams, tracks, dens, lodges, or extensive stands of water-killed trees (snags).	0	
		Likely based on known occurrence in the region and proximity to suitable habitat, which may include: (a) a persistent freshwater wetland, pond, or lake, or a perennial low or mid-gradient (<10%) channel, and (b) a corridor or multiple stands of hardwood trees and shrubs in vegetated areas near surface water.	0	
55.	0 1 : 1	Unlikely because site characteristics above are deficient, and/or this is a settled area or other area where beaver are routinely removed.	1	
F50	Groundwater Strength of Evidence	Select first applicable choice: Springs are known to be present within the AA, or if groundwater levels have been monitored, that has demonstrated that groundwater primarily discharges to the wetland for longer periods during the year than periods when the wetland recharges the groundwater.	0	Adhere to these criteria strictly – do not use personal judgment based on fen conditions, pH, or other evidence. Consult topographic maps to detect breaks in slope described here. Rust deposits associated with groundwater seeps may be most noticeable as orange discoloration in ice formations abong streams during each writer. IAM CS EA EP INV NP OF PH DPV SES WIC WSI.
		Most of the AA has a slope of -5%, or is very close to the base of a natural slope longer than 100 and much steeper than the slope of the AA, AND the pH of surface water, if known, is -5.5.	0	along streams during early winter. [AM, CS, FA, FR, INV, NR, OE, PH, PRv, SFS, WC, WS]
		Neither of above is true, although some groundwater may discharge to or flow through the AA. Or groundwater influx is unknown.	1	
F51	Internal Gradient	The gradient along most of the flow path within the AA is:		This is not the same as the shoreline slope. It is the elevational difference between the AA's inlet and outlet, divided by the flow-distance between them and converted to percent. If available, use a
		<2% or the AA has no surface water outlet (not even seasonally). 2-5%.	0	clinometer to measure this. Free clinometer apps can be downloaded to smartphones. If the wetland is large (longer than –1 km), this may be estimated using Google Earth to determine the minimum and
		6-10%.	0	maximum elevation within the AA, then dividing by length and multiplying by 100. [CS, NR, OE, PR,
Note for	or the next three quest	>10%. ions: If the AA lacks an upland edge, evaluate based on the AA's entire perimeter, and moving outward into whatever areas are	0	SR, WBF, WBN, WS]
adjacei	nt. In many situations, th	nese questions are best answered by measuring from aerial images.		TAM ES ED INVAID. DU DOL DO COM C. CO. CO. CO.
F52	Vegetated Buffer as % of Perimeter	Within a zone extending 30 m laterally from the AA's edge with upland and/or other wetlands, the percentage that contains perennial vegetation cover (except lawns, row crops, heavily grazed land, conifer plantations) is:		[AM, FA, FR, INV, NRv, PH, POL, PRv, SBM, Sens, SRv, STR, WBN]
		<5%.	0	
		5 to 30%. 30 to 60%.	0	
		60 to 90%.	0	
		>90%, or all the area within 30 m of the AA edge is other wetlands. SKIP to F55.

Pollinator Habitat (POL)	7.32	Moderate	3.33	Moderate	5.90	3.33
Native Plant Habitat (PH)	5.17	Moderate	5.38	Moderate	5.17	4.67
Public Use & Recognition (PU)			3.02	Moderate		2.48
Wetland Sensitivity (Sens)			2.04	Lower		2.81
Wetland Ecological Condition (EC)			3.01	Lower		5.97
Wetland Stressors (STR) (higher score means more stress)			5.07	Higher		4.12
Summary Ratings for Grouped Functions:						
HYDROLOGIC Group (WS)	1.09	Lower	3.95	Moderate	5.14	4.00
WATER QUALITY SUPPORT Group (max+avg/2 of SR, PR, NR, CS)	5.03	Moderate	7.19	Moderate	6.92	7.09
AQUATIC SUPPORT Group (max+avg/2 of SFS, INV, OE, WC)	5.03	Moderate	0.63	Lower	4.58	1.17
AQUATIC HABITAT Group (max+avg/2 of FA, FR, AM, WBF, WBN)	2.78	Moderate	0.60	Lower	3.45	1.62
TRANSITION HABITAT Group (max+avg/2 of SBM, PH, POL)	6.70	Moderate	4.70	Moderate	5.59	4.22
WETLAND CONDITION (EC)			3.01	Lower		5.97
WETLAND RISK (average of Sensitivity & Stressors)			3.55	Moderate		3.47
	NOTE: A coor	o of O door not	maan tha funa	tion or bonofit i	e abcont from t	an wotland It

NOTE: A score of 0 does not mean the function or benefit is absent from the wetland. It means only that this wetland has a capacity that is equal or less than the lowest-scoring one, for that function or benefit, from among the 98 NB calibration wetlands that were assessed previously.

Cover Page: Basic Description of Assessment	WESP-AC version 2
Site Name:	Burchill Wind Energy Project - MC-W-02
Investigator Name:	Derrick Mitchell
Date of Field Assessment:	5 August 2020
Nearest Town:	Lorneville (west Saint John), New Brunswick
Latitude (decimal degrees):	45.181689
Longitude (decimal degrees):	-66.187034
Is a map based on a formal on-site wetland delineation available?	Yes
Approximate size of the Assessment Area (AA, in hectares):	2.39
AA as percent of entire wetland (approx.). Attach sketch map if AA is smaller than the entire contiguous wetland.	
What percent (approx.) of the wetland were you able to visit?	100
What percent (approx.) of the AA were you able to visit?	100
Were you able to ask the site owner/manager about any of the questions?	No
Indicate here if you intentionally surveyed for rare plants, calciphile plants, or rare animals	Yes
Have you attended a WESP-AC training session? If so, indicate approximate month & year	Yes, September 2016
How many wetlands have you assessed previously using WESP-AC? (approx.)	100+
Comments about the site or this WESP-AC assessment (attach extra page if desired):	

Form OF (Office). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Conduct an assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answering many of the questions below will equire using these online map viewers:

Google Earth Pro: https://www.google.com/earth/download/gep/agree.html

GeoNB: http://www.snb.ca/geonb1/ and http://www.snb.ca/geonb1/e/apps/apps-E.asp

Geons: http://www.snb.ca/geonol/ and http://www.snb.ca/geonol/e/apps/apps/apps-e.asp
For most wetlands, completing this office data form will require 1-2 hours. For a list of functions to which each question pertains, see bracketed abbreviations in the Definitions/Explanations column. For detailed descriptions of each
WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus
Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding
Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity, STR= Stressors.

#	Indicators	Condition Choices	Data	Definitions/Explanations
OF1	Province	Mark the province in which the AA is located by changing the 0 in the column next to it to a *1". Mark only one.		This determines to which province's calibration wetlands the raw score of any wetland is normalised. In the function and benefits models, it also triggers the automatic exclusion of indicators for which no
		New Brunswick	1	spatial data exists in a particular province.
		Nova Scotia	0	
		Prince Edward Island	0	
		Newfoundland-Labrador (2)	0	
DF2	Ponded Area Within 1 km.	The area of surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) within 1 km is:		"Adjacent" means not separated from the AA by a wide expanse (>50 m) of upland (including roads >50 m wide). Include ponded areas likely to be hidden by wetland vegetation. If surface water
		<0.01 hectare (about 10 m x 10 m).	0	extends beyond 1 km, include only the part within 1 km. Do not include tidal areas. Measure the ar from aerial imagery using Google Earth Pro (click on Ruler icon in toolbar, then Polygon in pop-up
		0.01 - 0.1 hectare.	0	menu). With the GeoNB viewer, enable the Wetlands layer, then measure with the Draw & Measure
		0.1 - 1 hectare.	0	tool after specifying Aerial as the Basemap. However, do not rely entirely on wetland boundaries
		1 to 10 hectares.	1	shown in online wetlands layers. [PH, SBM, WBN]
		10 to 100 hectares.	0	
DF3	Ponded Water &	100 hectares. The area of wetlands and surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) within		See definition of adjacent in OF2. If the AA's wetland vegetation extends beyond 1 km, include only
JI 3	Wetland Within 1 km.	1 km is:		the part within 1 km. "Ponded" means not flowing in rivers or streams. [Sens, WBF]
		<0.01 hectare (about 10 m x 10 m).	0	
		0.01 - 0.1 hectare.	0	
		0.1 - 1 hectare.	0	4
		1 to 10 hectares.	0	4
		10 to 100 hectares. >100 hectares.	0	
)F4	Size of Largest Nearby	> 100 nectares. The largest vegetated patch or corridor that includes the AA's vegetation plus aladjacent upland vegetation that is not lawn, row crops,		See definition of adjacent in OF2. Use Google Earth Pro's polygon ruler (as described above).
	Vegetated Tract or Corridor	heavily grazed lands, conifer plantation is:		Exclude conifer plantations only if it is obvious that trees were planted in rows. [AM, PH, SBM, Sens]
	Comuci	<0.01 hectare (about 10 m x 10 m).	0	
		0.01 - 0.1 hectare.	0	
		0.1 - 1 hectare.	0	4
		1 to 10 hectares. 10 to 100 hectares.	0	4
		100 to 1000 hectares. 100 to 1000 hectares.	0	1
		>1000 hectares. [This is nearly always the answer in relatively undeveloped landscapes]	1	
DF5	Distance to Large Vegetated Tract	Proto in locators, Trans to meanly aways are answer in returning underenoper amuscapes; The minimum distance from theedge of the AA to the edge of the closest vegetated land (but excluding row crops, lawn, conifer plantation) larger than 375 hectares (about 2 km on a side), is:		To measure distance, use Google Earth Pro (Ruler > Line tool). Or use Draw & Measure tool at GeoNB. The 375-ha criterion is from the Fundy Model Forest Project. [AM, PH, POL, SBM, Sens]
	3	450 m, and not separated from the 375-ha vegetated area by any width olpaved roads, stretches of open water, row crops, bare ground, awn, or impervious surface. Or the AA itself contains >375 ha of vegetation. [This is often the answer in relatively undeveloped landscaps.]	1 es.]	
		<50 m, but completely separated from the 375-ha vegetated area by those features, and AA does not contain >375 ha of vegetation.	0	
		50-500 m, and not separated.	0	
		50-500 m, but separated by those features.	0	
		0.5 - 5 km, and not separated.	0	
		0.5 - 5 km, but separated by those features.	0	-
05/		None of the above (the closest patches or corridors which are that large are >5 km away).	0	
DF6	Herbaceous Uniqueness	The AA's vegetation cover is > 10% herbaceous* but uplands within 5 km have <10% herbaceous cover. If so, enter "3" and continue to 0F7. If not, consider: The AA's vegetation cover is >10% herbaceous* but uplands within 1 km have <10% herbaceous cover. If so enter "2" and continue to 0F7. If not, consider: The AA's vegetation cover is >10% herbaceous* but uplands within 100 m of the wetland edge have <10% herbaceous cover. If so, enter "1".	7	For this question only, consider moss to be herbaceous vegetation. Determine the score by viewing aerial imagery in Google Earth after successively drawing or estimating the boundaries of the buffers of 5 km, 1 km, and 100 m radius focused on the center of the AA. Circles of specified radius can be drawn in Google Earth Pro by clicking on the Ruler icon, then Circle in the pop-up menu. [AMv, PHv POLv, SBMv, WBFv, WBNv]
		[* NOTE: Exclude lawns, row crops, heavily grazed lands, forest, shrublands. Include moss as well as grasslike plants in this use of "herbaceous vegetation"]		
DF7	Woody Uniqueness	The AA's vegetation cover is >10% woody' but uplands within 5 km have <10% woody cover. If so, enter "3" and continue to OF8. If not, consider: The AA's vegetation is >10% woody' but uplands within 1 km have <10% woody cover. If so enter "2" and continue to OF8. If not, consider:	2	See above. Do not consider conifer plantations to be forest if it is obvious that trees were planted in rows. [AMv, PHv, POLv, SBMv]
		The AA's vegetation is >10% woody' but uplands within 100 m of the wetland edge have <10% woody cover. If so, enter "1" [" NOTE: woody cover = trees & shrubs taller than 1 m.]		
OF8	Local Vegetated Cover Percentage	Draw a 5-km radius circle measured from the center of the AA. Ignoring all permanent water in the circle, the percent of the remaining an that is wooded or unmanaged herbaceous vegetation (NOT lawn, row crops, bare or heavily grazed land, clearcuts, or conifer plantations is:		In Google Earth, draw the 5 km buffer and then estimate land cover percentages, or do GIS analysis of an appropriate land cover layer. [AM, PH, POL, SBM, Sens]
		<5% of the land.	0	1
		5 to 20% of the land.	0	
		20 to 60% of the land.	0	1
		60 to 90% of the land.	0	
)FC	Tuno of Land Course	>90% of the land. SKIP to OF10.		[AM CDM]
OF9	Type of Land Cover Alteration	Within the 5-km radius circle, and ignoring all permanent water, the land area that is bare or non-perennial cover is mostly:		[AM, SBM]
	, moration	Impervious surface, e.g., paved road, parking lot, building, exposed rock.	0]
		Bare pervious surface, e.g., lawn, recent (<5 yrs ago) clearcut, dirt or gravel road, cropland, landslide, conifer plantation.	0	
	Distance by Road to	Measured along the maintained road nearest the AA, the distance to the nearestpopulation center is:		"Population center" means a settled area with more than about 5 regularly- inhabited structures per
JF10	Nearest Population	<100 m.	0	square kilometer. In Google Earth, click on the Ruler icon, then Path, and draw and measure the route. Or use the GeoNB's Draw & Measure tool> Freehand Line to draw and measure the route to
JF10	Center			aroute. Or use the george's praw a measure tour? Freehally Line to gray and niedsure the route to
JF10	Center	100 - 500 m.	0	Settlements (click on Place Names in menu) or other areas not close to manned settlements but
JF10	Center	100 - 500 m. 0.5- 1 km.	0	Settlements (click on Place Names in menu) or other areas not close to mapped settlements but which meet the criteria.[FAv, FRv, NRv, PH, PU, SBM, WBFv]
JF10	Center			

OF11	Distance to Nearest	From the center of the AA, the distance to the nearest maintained public road (dirt or paved) is:		Determine this by viewing aerial imagery in Google Earth and measuring with the Ruler>Line tool.
	Maintained Road	<10 m.	0	use the GeoNB's Draw Line tool. [AM, FAv, FRv, NRv, PH, PU, SBM, STR, WBN]
		10 - 25 m.	0	
		25 - 50 m.	0	
		50 - 100 m. 100 - 500 m.	0	
		>500 m.	0	
OF12	Wildlife Access	Draw a circle of radius of 5 km from the center of the AA. If mammals and amphibians can move from the center of the AA to ALL other separate wetlands and ponds located within the circle without being forced to cross pavement (any width), lawns, bare ground, and/or marine waters, mark 1 = yes can move to all, 0 = no. Change toblank if there are no other wetlands within 5 km.	0	In NB, enable the Wetlands layer in GeoNB (despite its omissions) to show surrounding wetlands a roads, while estimating the location of the 5 km circle (or draw the 5 km circle in Google Earth Pro using the Circle tool and compare). Evaluate using Google Earth, being cautious to search for roads hidden under forest canopy. [AM, SBM, STR]
OF13	Distance to Ponded	The distance from the AA center to the closest (but separate) ponded water body visible in GoogleEarth imagery is:		In Google Earth, zoom in closely to examine the surrounding landscape for ponds, lakes, and
01 13	Water	450 m, and not separated by any width of paved roads, stretches of open water, row crops, lawn, bare ground, or impervious surface.	0	wellands that appear to be permanently flooded. Enable the GeoNB viewer's Wellands layer as we [AM, PH, SBM, Sens, WBF, WBN]
		<50 m, but completely separated by those features.	0	
		50-500 m, and not separated.	0	
		50-500 m, but separated by those features. 0.5 - 1 km. and not separated.	0	
		0.5 - 1 km, but separated by those features.	0	
		None of the above (the closest patches or corridors that large are >1 km away).	0	1
OF14	Distance to Large Ponded Water	The distance from the AA center to the closest (but separate)non-tidal body of water that is ponded during most of the year and islarger than 8 hectares during most of a normal year is:		Determine this by viewing aerial imagery in Google Earth. [Sens, WBF, WBN]
		<100 m.	0	
		100 m - 1 km. 1 - 2 km.	0	-
		2-5 km.	1	
		5-10 km.	0	1
		>10 km.	0	
OF15	Tidal Proximity	The distance from the AA edge to the closesttidal water body (regardless of its salinity) is:		in Google Earth, measure the distance to the ocean (including Bay of Fundy) or tidal river, whicheve is closer. If you need to see how far upriver a river is tidal, see the KMZ file provided with this
		<100 m.	0	closer. If you need to see now far upriver a river is tidal, see the kinz life provided with this calculator for NB (NB Headtide). Points shown in those files are only an approximation, so local
		100 m - 1 km.	0	information if available may be preferable. [FA, WBF]
		1 - 5 km. 5-10 km.	0	
		10-40 km.	0	1
		>40 km.	0	1
OF16	Upland Edge Contact	Select one:		[NR, SBM, Sens]
		The AA has no upland edge (or upland is <1% of perimeter). The AA is entirely surrounded by (& contiguous with) other wetlands or water	. 0	
		1-25% of the AA's perimeter abuts upland (including filled areas). The rest adjoins other wetlands or water that is mostly wider than the AA	0	
		25-50% of the AA's perimeter abuts upland. The rest adjoins other wetlands or water that is mostly wider than the AA. 50-75% of the AA's perimeter abuts upland. The rest adjoins other wetlands or water that is mostly wider than the AA.	0	
		More than 75% of the AA's perimeter abuts upland. Any remainder adjoins other wetlands or water that is mostly wider than the AA. This	1	
		will be true for most assessments done with WESP-AC.		
OF17		Within 5 km downstream or downslope of the AA (select first true choice):		In the GeoNB map viewer: click on "More" in upper right, then "Flood Information". Expand the mer
	tidal Waters	Maps show Flood Zone or Flood Risk areas and there appears to be infrastructure vulnerable to river flooding not caused by tidal storm surges.	0	under it by clicking on the arrow to its left and the slider to its right. Uncheck the first (Limits of Data box. Where available, LiDAR imagery can provide finer elevational resolution useful for flood modeling, [WSv]
		Maps show Flood Zone or Flood Risk areas, but infrastructure is absent or is not vulnerable to floods from a non-lidal river. In some cases levees, upriver dams, or other measures may partly limit damage or risk from smaller events. Maps do not show Flood Zone or Flood Risk areas for no such mapping has been done locally) and there appears to be infrastructure	0	
		vulnerable to river flooding unrelated to tidal storm surges. Maps do not show Flood Zone or Flood Risk areas (or no such mapping has been done locally) and there ino infrastructure vulnerable	1	
OF18	Relative Elevation in Watershed	lo river flooding unrelated to lidal storm surges. In Google Earth, enable the Terrain layer (lower left menu) and open the NB_Watersheds KMZ file that accompanies this calculator. Then determine the AAS approximate elevation (bottom right, NOT the "eye att"). Then move cursor around to determine the watershed's	0.15	[FA, NR, Sens, SFSv, WCv, WSv]
OF19	Water Quality Sensitive	maximum and minimum elevation. Divide the AA's elevation by the (max-min). In Google Earth, open the KMZ file NB_Watershed Protected Area which accompanies this calculator. The AA is within such an area.	0	If an ACCDC report is available for this AA, it also may contain such information. [NRv]
OF20	Watershed or Area Degraded Water	Enter 1= yes, 0= no. Sampling indicates a problem with concentrations of metals, hydrocarbons, nutrients, or other substances (excluding bacteria, acidic		May use existing data, or sample those waters as part of this wetland assessment. "Harmful" should
UF2U	Upstream	water, high temperatures) being present at levels harmful to aquatic life or humans, and:	0	way use existing data, or sample index waters as part or this wettain assessment. Faithful should be evaluated with regard to current federal or provincial water quality standards. [AM, FA, FR, NRv PRv, SRv, STR, WBF, WBN]
		The condition is present within the AA. The condition is present in waters within 1 km that flowinto the AA, but has not been documented in the AA itself.	0	1
		Sampling during both low water periods and times with high runoff (storms, snowmelt) indicates no problems in either the AA or inflowing waters.	0	
		Data are insufficient (no or inadequate sampling within 1 km, or condition exists only at >1 km upstream)This is the situation for nearly all wetlands in this region.	1	
OF21	Degraded Water Downstream	The problem described above is downslope from the AA, and:		May use existing data, or monitor waters as part of this wetland assessment. [NRv, PRv, SRv]
	Downstiediil	The condition is present within 1 km downslope and connected to the AA by a channel.	0	
		The condition is present within 5 km downslope and connected to the AA by a channel, or within 1 km but not connected to the AA by a channel. Sampling during both low water periods and times with high runoff (storms, snowmelt) indicates no problems in either the AA or inflowing	0	
		waters. Data are insufficient (no or inadequate sampling within 1 km, or condition exists only at >1 km upstream)This is the situation for nearly	1	
0555		all wetlands in this region.		
OF22	Wetland as a % of Its Contributing Area (Catchment)	From a topographic map and field observations, estimate the approximate boundaries of the catchment (CA) of the entire wetland of which Am may be only a part. Then adjust those boundaries if necessary based on your field observations of the surrounding and/or busing procedures described in the Manual. Divide the area of the wetland (not just the AA) by the approximate area of its catchment excluding the area of the wetland itself. When doing the calculation, if ponded water is adjacent to the wetland, include that in the wetland area. The result is:		Topographic maps may be viewed online at the National Atlas of Canada (Toporama): http://atlas.gc.ca/loporama/en/index.html [NR, PR, Sens, SR, WS]
		< 0.01, or calchment size unknown due to stormwater pipes that collect water from an indeterminate area. 0.01 to 0.1.	0	
		0.1 to 1.	1	
		>1 (wetland is larger than its catchment (e.g., wetland with flat surrounding terrain and no inlet, or is entirely isolated by dikes, or is a raised body. The proportion of the AA's contributing area (measured to no more than 1000 m upslope) that is comprised of buildings, roads, parking lots	0	[FA, INV, NRv, PRv, SRv, STR, WCv, WSv]

--	------------------------------

Form F (Field). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Walk for no less than 10 minutes from the wetland edge towards its core, in the part of the AA that is proposed for alteration. If no alteration is proposed, walk in a portion that appears to be most representative of the wetland overall. Walk only where it is safe and legal to do so. Conduct the assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answer these questions primarily based on your onsite observations and interpretations. Do not write in shaded parts of this data form. Answering some questions accurately may require conferring with the landowner or other knowledgable persons and/or reviewing aerial imagery. For most wetlands, completing this field data form will require 1-2 hours on a site. For a list of functions to which each question pertains, see the accompanying Interpretations form. For detailed descriptions of each WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage & Delay, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity, STR= Stressors.

1	Wetland Type	Follow the key below and mark the ONE row that best describes MOST of the vegetated part of the AA:		Ericaceous shrubs are ones in the heather family (Ericaceae). Most have leathery evergreen leaves They include rhododendron, azalea, swamp laurel, leatherleaf, Labrador tea, and others. Most require acidic soil. Although not in the family Ericaceae, sweetgale (<i>Myrica gale</i>) should be counted also. [AM, CS, FA, FR, INV, NR, OE, PH, Sens, SFS, WBF, WBN]
		A. Moss and/or lichen cover more than 25% of the ground. Often dominated by ericaceous shrubs (e.g., Labrador tea) or other acid-tolerant plants (e.g., bog cranberry, pitcher plant, sundew, orchids). Substrate is mostly undecomposed peat. Choose between A1 and A2 and mark the choice with a 1 in their adjoining column. Otherwise go to B below.		
		A1. Surface water is usually absent or, if present, pH is typically <4.5 and conductivity is usually <100 µS/cm (<64 ppm TDS). Trees are absent or nearly so. Sedge cover usually sparse or absent but cottongrass and/or lichen cover may be extensive, as well as cloudberry, lingonberry, sheep laurel, and a sedge (Carex rarillora). Welfand surface and surrounding landscape are seldom sloping and welfand often is domed (convex). Inlet and outlet channels are usually absent. If known, pH of peat is <4.0.	0	
		A2. Not A1. Surface water, if present, has pH typically >4.5 and conductivity is usually >100 µS/cm (>64 ppm TDS). Sedge cover is usually extensive, and/or tree and fall shrub cover is extensive. Sometimes at toe of slope or edge of water body. An exit channel is usually present. Wetter than A1 and peat depth may be shallower (<2 m).	0	
		B. Moss and/or lichen cover less than 25% of the ground. Soil is mineral or decomposed organic (muck). Choose between B1 and B2 and mark the choice with a 1 in their adjoining column:		
		B1. Trees and shrubs taller than 1 m comprise more than 25% of the vegetated cover. Surface water is mostly absent or inundates the vegetation only seasonally (e.g., vernal pools or floodplain).	1	
		B2. Not B1. Tree & tall shrubs comprise less than than 25% of the vegetated cover. Vegetation is mostly herbaceous, e.g., cattail, bulrush, burreed, pond lily, horsetail. Surface water may be extensive and fluctuates seasonally, being either persistent or drying up partly or entirely.	0	
NA sh nclud adja lescn	ould also include part of a le the open water part adj cent " is used synonymo libed features along their a	the AA should include all persistent waters in ponds smaller than 8 hectares (-283 m on a side) that are adjacent to the AA. The the water area of adjacent ponded water larger than 8 ha and adjacent rivers wider than 20 m. Specifically, the AA should jacent to wetland vegetation and equal in width to the average width of that vegetated zone. Throughout this data form, usly with abutting, adjoining, bordering, contiguous and means no upland (manmade or natural) completely separates the directly shared edge. Features joined only by a channel are not necessarily considered to be adjacent a large portion of their res do not have to be hydrologically connected in order to be considered adjacent.		
2	Wetland Types - Adjoining or Subordinate	If the AA is smaller than 1 ha, mark all other types that occupy more than 1% of the vegelated AA. If the AA is larger than 1 ha, mark all other types which are within or adjacent to the AA and occupy more than 1 ha, as visible from the AA or as interpreted from aerial imagery. Do not mark again the type marked in F1.		1 hectare is 10,000 sq. m or about 2.5 acres. It could have dimensions of 100 m by 100 m, 1000 m by 10 m, or similar. [AM, INV, SBM, WBF]
		A1. A2.	0	
		B1.	0	
2	Woody Height & Form	B2. Following EACH row below, indicate with a number code the percentage of the living vegetation in the AA which is occupied by that feature (6	0	Deciduous shrubs in this region usually include buttonbush, Labrador tea, bayberry (Morella),
3	Diversity	if >95%, 5 if 75-95%, 4 if 50-75%, 3 if 25-50%, 2 if 5-25%, 1 if <5%, 0 if none). If the vegetated part of the AA is largely herbaceous (non-woody) vegetation, these percentages should not sum to 100%.	-	becludous sinus in linis region usuary include trainingship, Laurious et a Judycery (information), huckleberry, carbatery, doubdery, sweetgale, alder, willow, birch, ash, dogwood, and a few others. If you assigned a code of 3 or higher to any of the first four choices and the ground cover beneath the trees/shrubs is <25% moss, then question F1 might be "B1". [CS, INV, NR, PH, POL, SBM, Sens]
		coniferous trees (may include tamarack) taller than 3 m. deciduous trees taller than 3 m.	5 1	
		coniferous or ericaceous shrubs or trees 1-3 m tall not directly below the canopy of trees.	2	
		deciduous shrubs or trees 1-3 m tall not directly below the canopy of trees. coniferous or ericaceous shrubs <1 m tall not directly below the canopy of taller vegetation.	2	
		deciduous shrubs or trees <1 m tall (e.g., deciduous seedlings) not directly below the canopy of taller vegetation.	2	
lote :	If none of top 4 rows in	F3 was marked 2 or greater , SKIP to F9 (N fixers).		
4	Dominance of Most Abundant Shrub	Determine which two woody plant species comprise the greatest portion of the low (<3 m) woody cover . Then choose one:		[PH, POL, SBM, Sens]
	Species	those species together comprise > 50% of such cover. those species together do not comprise > 50% of such cover.	0	
5	Woody Diameter Classes	Index species together on no comprise > 30% or sour over: Mark ALL the types that comprise >5% of the woody canopy cover in the AA or >5% of the wooded areas (if any) along its upland edge (perimeter). The edge should include only the trees whose canopies extend into the AA.		Estimate the diameters at chest height. If small-diameter trees are overtopped (shaded) by larger ones, visualise a "subcanopy" at the average height of the smaller-dbh trees, to serve as a basis for th minimum 5% canopy requirement in this question. The trees and shrubs need not be wetland species [AM, CS, POL, SBM, Sens, WBN]
		coniferous, 1-9 cm diameter and >1 m tall.	1	
		broad-leaved deciduous 1-9 cm diameter and >1 m tall. coniferous, 10-19 cm diameter.	1	
		broad-leaved deciduous 10-19 cm diameter.	1	
		coniferous, 20-40 cm diameter. broad-leaved deciduous 20-40 cm diameter.	1	
		proad-leaved deciduous 20-40 cm diameter. coniferous, >40 cm diameter.	1	
		broad-leaved deciduous >40 cm diameter.	0	
6	Height Class Interspersion	Follow the key below and mark the ONE row that best describes MOST of the AA: A. Neither the vegetation taller than 1 m nor the vegetation shorter than that comprise >70% of the vegetated part of the AA. They each comprise 30-70%. Choose between A1 and A2 and mark the choice with a 1 in the adjoining column. Otherwise go to B below.		[AM, INV, NR, PH, SBM, Sens]
		A1. The two height classes are mostly scattered and intermixed throughout the AA.	1	
		A2. Not A1. The two height classes are mostly in separate zones or bands, or in proportionately large clumps.	0	
		D F31 d		
		B. Either the vegetation shorter than 1 m comprises >70% of the vegetated part of the AA, or the vegetation taller than that does. One size class might even be totally absent. Choose between B1 and 62 and mark the choice with a 1 in the adjoining column: 11 The lose provided height face is morettle excitored and identificial within the consideration.	C

If true enter "1" and continue, If false, enter "0" and SKIP to F41 (Floating Algae & Duckweed). In ducks-eye aerial view, the percentage of the ponded water that is open (lacking emergent vegetation during most of the growing season, and unhidden by a forest or shrub canopy) is: None, or -1% of the AA and largest pool occupies <0.01 hectares. Enter "1" and SKIP to F41 (Floating Algae & Duckweed). 1-4% of the ponded water. Enter "1" and SKIP to F41 (Floating Algae & Duckweed). 5-30% of the ponded water. 30-70% of the ponded water. 70-9% of the ponded water. 100% of the ponded water. At the time during the growing season when the AA's water level is lowest, the average width of vegetated area in the AA that separates adjoining uplands from open water within the AA is: 1 m. 1 - 9 m. 10 - 29 m. 30 - 49 m. 50 - 100 m. > 100 m. or open water is absent at that time. During most of the part of the growing season when water is present, the percentage of the AA's water edge length that is nearly flat (a sloope less than about 5% measured within 5 m landward of the water) is: -1% of the water edge. 5-50% of the water edge. 5-50% of the water edge. 1-25% of the water edge. 1-25% of the water edge. 1-55% of the water edge. 1-55% of the water edge. 1-55% of the water edge.	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	on the water surface or entirely submersed beneath it. [AM, CS, FA, FR, INV, NR, OE, PR, SR, WBF, WBN, WC] "Vegetated area" does not include underwater or floating-leaved plants, i.e., aquatic bed. Width may include wooded riparian areas if they have wetland soil or plant indicators. [AM, CS, NR, OE, PH, PR, SBM, Sens, SR, WBN] If several isolated pools are present in early summer, estimate the percent of their collective shorelines that has such a gentle slope. [SR, WBN]

FieldF form - Non-tidal Page 3 of 5

F37	Interspersion of	During most of the part of the growing season when water is present, the spatial pattern of emergent vegetation within the water is mostly:		[AM, FA, FR, INV, NR, OE, PH, PR, SBM, SR, WBF, WBN]
	Emergents & Open Water	Scattered. More than 30% of such vegetation forms small islands or corridors surrounded by water.	0	
	water	Intermediate.	0	
		Clumped. More than 70% of such vegetation is in bands along the wetland perimeter or is clumped at one or a few sides of the surface water area.	0	
F38	Persistent Deepwater	If the deepest patch of surface water (flowing or ponded) in or directly adjacent to the AA is mostly deeper than 0.5 m for >2 weeks during the growing season, enter "1" and continue. If not, enter "0" and SKIP to F42 (Connection).	0	
F39	Area Non-vegetated Aquatic	During most of the growing season and in waters deeper than 0.5 m, the cover for fish, aquatic invertebrates, and/or amphibians that is		For this question, consider only the wood that is at or above the water surface. Estimates of underwater
	Cover	provided NOT by living vegetation, but by accumulations of dead wood and undercut banks is:		wood based only on observations from terrestrial viewpoints are unreliable so should not be attempted. [AM, FA, FR, INV]
		Little or none. Intermediate.	0	[AW, FA, FK, 11VV]
		Extensive.	0	
F40	Isolated Island	The AA contains (or is part of) an island or beaver lodge within a lake, pond, or river, and is isolated from the shore by water depths > 1 m on all sides during an average June. The island may be solid, or it may be a floating vegetation mat that is sufficiently large and dense to support a waterbird nest.	0	[WBN]
F41	Duckweed	At some time of the year, mats of algae and/or duckweed are likely to cover >50% of the AA's otherwise-unshaded water surface, or blanket >50% of the underwater substrate. If true, enter "1" in next column. If untrue or uncertain, enter "0".	0	[EC, PR, WBF]
F42	Channel Connection & Outflow Duration	The most persistent surface water connection (outlet channel or pipe, ditch, or overbank water exchange) between the AA and a downslope stream network is: [Note: If the AA represents only part of a welland, answer this according to whichever is the least permanent surface connection: the one between the AA and the rest of the wetland, or the surface connection between the wetland and the downslope stream network.] Persistent (surface water flows out for >9 months/year).	0	Consider the connection regardless of whether the surface water is frozen. The "downslope stream network" could consist of ditches, rivers, ponds, or lakes which eventually connect to the ocean. If this cannot be determined while visiting the AA, consult topographic maps perhaps by viewing these online with Toporama (http://atlas.nrcan.gc.ca/toporama/en/index.html) [CS, FA, FR, NR, OE, PR, Sens, SFS SR, WCv, WS]
		Seasonal (surface water flows out for 14 days to 9 months/year, not necessarily consecutive).	1	
		Temporary (surface water flows out for <14 days, not necessarily consecutive). None but maps show a stream network downslope from the AA and within a distance that is less than the AA's length. SKIP to F47 (pH	0	
		Measurement).		
		No surface water flows out of the wetland except possibly during extreme events (-once per 10 years). Or, water flows only into a wetland, dilch, or lake that lacks an outlet. SKIP to F47 (pH Measurement).	0	
F43	Outflow Confinement	During major runoff events, in the places where surface water exits the AA or connected waters nearby, the water:		"Major runoff events" would include biennial high water caused by storms and/or rapid snowmelt. [CS, NR, OE, PR, Sens, SR, STR, WS]
		Mostly passes through a pipe, culvert, narrowly breached dike, berm, beaver dam, or other partial obstruction (other than natural topography) that does not appear to drain the wetland artificially during most of the growing season.	0	
		Leaves through natural exits (channels or diffuse outflow), not mainly through artificial or temporary features.	1	
		Is exported more quickly than usual due to ditches or pipes within the AA or connected to its outlet, or within 10 m of the AA's edge, which drain the wetland artificially, or water is pumped out of the AA.	0	
F44	Tributary Channel	At least once annually, surface water from a tributary channel that is >100 m long moves into the AA. Or, surface water from a larger permanent water body adjacent to the AA spills into the AA. If it enters only via a pipe, that pipe must be fed by a mapped stream or lake further upslope. If no, SKIP to F47 (pH Measurement).	0	If inlet tributaries cannot be searched for due to inaccessibility of part of the AA, follow suggestions in F42 above. [NRv, PH, PRv, SRv]
F45	Input Water Temperature	Based on lack of shade, water source characteristics, or actual temperature measurements, the inflow is likely to be warmer than surface water in the AA during part of most years. Enter 1= yes, 0= no.	0	[WCv]
F46	Throughflow	During its travel through the AA at the time of peak annual flow, water arriving in channels: [select only the ONE encountered by most of the incoming water].		[FA, FR, INV, NR, OE, PR, SR, WS]
	Resistance	Does not bump into many plant stems as it travels through the AA. Nearly all the water continues to travel in unvegetated (often incised) channels that have minimal contact with wetland vegetation, or through a zone of open water such as an instream pond or lake.	0	
		Bumps into herbaceous vegetation but mostly remains in fairly straight channels. Bumps into herbaceous vegetation and mostly spreads throughout, or is in widely meandering, multi-branched, or braided channels.	0	
		Bumps into tree trunks and/or shrub stems but mostly remains in fairly straight channels. Bumps into tree trunks and/or shrub stems and follows a fairly indirect path from entrance to exit (meandering, multi-branched, or braided).	0	
F47	pH Measurement	The pH in most of the AA's surface water:		Preferably, measure this in larger areas of ponded surface water within the AA, or in streams that have
		Was measured, and is: [enter the reading in the column to the right.]	0	passed through (not along) most of the AA. Unless surface water is completely absent, do not dig holes or make depressions in peat in order to provide water for this measurement. Avoid measuring near
		Was not measured but surface water is present and is darkly tea-coloured. Or if no surface water, then mosses and plants that indicate pealland (e.g., Labrador tea) are prevalent. Enter *11. Neither of above. Enter *11.	0	roads or in puddles formed only by recent rain. [AM, FA, FR, NR, WBF, PH, PR, Sens, WBF, WBN]
F48	TDS and/or	The TDS (total dissolved solids) or conductivity off the AA's surface water is: (select the first true row with information):		See above for measurement guidance. [FR, INV, NRv, PH, PRv, Sens]
	Conductivity	TDS is: [Enter the reading in ppm or mg/L in the column to the right, if measured, or answer next row.]		
		Conductivity is [Enter the reading in µS/cm in the column to the right.] Was not measured, but plants that indicate saline conditions cover much of the vegetated AA. Enter *1*.	0	
		Neither of above	1	
F49	Beaver Probability	Use of the AA by beaver during the past 5 years is (select most applicable ONE):		[FA, FR, PH, SBM, Sens, WBF, WBN]
		Evident from direct observation or presence of gnawed limbs, dams, tracks, dens, lodges, or extensive stands of water-killed trees (snags).	0	
		Likely based on known occurrence in the region and proximity to suitable habitat, which may include: (a) a persistent freshwater wetland, pond, or lake, or a perennial low or mid-gradient (<10%) channel, and (b) a corridor or multiple stands of hardwood trees and shrubs in vegetated areas near surface water.	0	
F50	Groundwater Strength	Unlikely because site characteristics above are deficient, and/or this is a settled area or other area where beaver are routinely removed. Select first applicable choice:	1	Adhere to these criteria strictly do not use personal judgment based on fen conditions, pH, or other
1 30	of Evidence	Series in st. applicable choice: Springs are known to be present within the AA, or if groundwater levels have been monitored, that has demonstrated that groundwater primarily discharges to the wetland for longer periods during the year than periods when the wetland recharges the groundwater.	0	Audited to these chiefla shirtly - out hot use personal puginent based of her continuors, pr., or other evidence. Consult lopographic maps to detect breaks in slope described here. Rust deposits associated with groundwater seeps may be most noticeable as orange discoloration in ice formations along streams during early winter. [AM, CS, FA, FR, INV, NR, OE, PH, PRv, SFS, WC, WS]
		Most of the AA has a slope of >5%, or is very close to the base of a natural slope longer than 100 and much steeper than the slope of the AA, AND the pH of surface water, if known, is >5.5.	0	
F51	Internal Gradient	Neither of above is true, although some groundwater may discharge to or flow through the AA. Or groundwater influx is unknown. The gradient along most of the flow path within the AA is:	1	This is not the same as the shoreline slope. It is the elevational difference between the AA's inlet and
	cma Gradietti	The gradient along most of the new part within the AA is. The AA has no surface water outlet (not even seasonally).	1	outlet, divided by the flow-distance between them and converted to percent. If available, use a
		2-5%.	0	clinometer to measure this. Free clinometer apps can be downloaded to smartphones. If the wetland is large (longer than –1 km), this may be estimated using Google Earth to determine the minimum and
		6-10%. >10%.	0	maximum elevation within the AA, then dividing by length and multiplying by 100. [CS, NR, OE, PR, SR, WBF, WBN, WS]
		ions: If the AA lacks an upland edge, evaluate based on the AA's entire perimeter, and moving outward into whatever areas are		
adjace F52		nese questions are best answered by measuring from aerial images. Within a zone extending 30 m laterally from the AA's edge with upland and/or other wetlands, the percentage that contains perennial		[AM, FA, FR, INV, NRv, PH, POL, PRv, SBM, Sens, SRv, STR, WBN]
	of Perimeter	vegetation cover (except lawns, row crops, heavily grazed land, conifer plantations) is:		
		<5%. 5 to 30%.	0	
		30 to 60%.	0

Waterbird Feeding Habitat (WBF)	0.00	Lower	0.00	Lower	0.00	0.00
Waterbird Nesting Habitat (WBN)	0.00	Lower	0.00	Lower	0.00	0.00
Songbird, Raptor, & Mammal Habitat (SBM)	7.27	Higher	6.67	Moderate	6.03	6.67
Pollinator Habitat (POL)	9.80	Higher	6.67	Moderate	7.89	6.67
Native Plant Habitat (PH)	8.26	Higher	7.91	Higher	6.42	6.86
Public Use & Recognition (PU)			2.07	Lower		1.80
Wetland Sensitivity (Sens)			0.00	Lower		2.02
Wetland Ecological Condition (EC)			7.83	Higher		8.75
Wetland Stressors (STR) (higher score means more stress)			0.22	Lower		2.34
Summary Ratings for Grouped Functions:						
HYDROLOGIC Group (WS)	3.59	Moderate	0.29	Lower	5.81	0.38
WATER QUALITY SUPPORT Group (max+avg/2 of SR, PR, NR, CS)	6.38	Higher	0.29	Lower	7.82	0.98
AQUATIC SUPPORT Group (max+avg/2 of SFS, INV, OE, WC)	5.95	Moderate	2.29	Moderate	5.02	1.53
AQUATIC HABITAT Group (max+avg/2 of FA, FR, AM, WBF, WBN)	1.78	Lower	2.12	Lower	2.92	2.54
TRANSITION HABITAT Group (max+avg/2 of SBM, PH, POL)	9.12	Higher	7.50	Higher	7.34	6.80
WETLAND CONDITION (EC)			7.83	Higher		8.75
WETLAND RISK (average of Sensitivity & Stressors)			0.11	Lower		2.18
	NOTE: A scor	e of 0 does not	moon the fund	ion or honofit i	a abaant from t	no wotland It

NOTE: A score of 0 does not mean the function or benefit is absent from the wetland. It means only that this wetland has a capacity that is equal or less than the lowest-scoring one, for that function or benefit, from among the 98 NB calibration wetlands that were assessed previously.

Cover Page: Basic Description of Assessment	WESP-AC version 2
Site Name:	Burchill Wind Energy Project - PH-W-07
Investigator Name:	Derrick Mitchell
Date of Field Assessment:	6 August 2020
Nearest Town:	Lorneville (west Saint John), New Brunswick
Latitude (decimal degrees):	45.204537
Longitude (decimal degrees):	-66.188376
ls a map based on a formal on-site wetland delineation available?	Yes
Approximate size of the Assessment Area (AA, in hectares):	3.34
AA as percent of entire wetland (approx.). Attach sketch map if AA is smaller than the entire contiguous wetland.	
What percent (approx.) of the wetland were you able to visit?	100
What percent (approx.) of the AA were you able to visit?	100
Were you able to ask the site owner/manager about any of the questions?	No
Indicate here if you intentionally surveyed for rare plants, calciphile plants, or rare animals	Yes
Have you attended a WESP-AC training session? If so, indicate approximate month & year	Yes, September 2016
How many wetlands have you assessed previously using WESP-AC? (approx.)	100+
Comments about the site or this WESP-AC assessment (attach extra page if desired):	

Form OF (Office). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Conduct an assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answering many of the questions below will equire using these online map viewers:

Google Earth Pro: https://www.google.com/earth/download/gep/agree.html

GeoNB: http://www.snb.ca/geonb1/ and http://www.snb.ca/geonb1/e/apps/apps-E.asp

Geons: http://www.snb.ca/geonol/ and http://www.snb.ca/geonol/e/apps/apps/apps-t-asp For most wetlands, completing this office data form will require 1-2 hours. For a list of functions to which each question pertains, see bracketed abbreviations in the Definitions/Explanations column. For detailed descriptions of each WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity,

Form F (Field). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Walk for no less than 10 minutes from the wetland edge towards its core, in the part of the AA that is proposed for alteration. If no alteration is proposed, walk in a portion that appears to be most representative of the wetland overall. Walk only where it is safe and legal to do so. Conduct the assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answer these questions primarily based on your onsite observations and interpretations. Do not write in shaded parts of this data form. Answering some questions accurately may require conferring with the landowner or other knowledgable persons and/or reviewing aerial imagery. For most wetlands, completing this field data form will require 1-2 hours on a site. For a list of functions to which each question pertains, see the accompanying Interpretations form. For detailed descriptions of each WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage & Delay, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity, STR= Stressors.

#	Indicators	Condition Choices	Data	Definitions/Explanations
1	Wetland Type	Follow the key below and mark the ONE row that best describes MOST of the vegetated part of the AA:		Ericaceous shrubs are ones in the heather family (Ericaceae). Most have leathery evergreen leaves. They include rhododendron, azalea, swamp laurel, leatherleaf, Labrador tea, and others. Most require
		A. Moss and/or lichen cover more than 25% of the ground. Often dominated by ericaceous shrubs (e.g., Labrador lea) or other acid-lolerant plants (e.g., bog cranberry, pitcher plant, sundew, orchids). Substrate is mostly undecomposed peat. Choose between A1 and A2 and mark the choice with a 1 in their adjoining column. Otherwise go to 8 below.		acidic soil. Although not in the family Ericaceae, sweetgale (Myrica gale) should be counted also. [AM, CS, FA, FR, INV, NR, OE, PH, Sens, SFS, WBF, WBN]
		A1. Surface water is usually absent or, if present, pH is typically <4.5 and conductivity is usually <100 μS/cm (<64 ppm TDS). Trees are absent or nearty so. Sedge cover usually sparse or absent but cottongrass and/or lichen cover may be extensive, as well as cloudberry, lingonberry, sheep laurel, and a sedge (Carex rarillora). Welland surface and surrounding landscape are seldom sloping and welland often is domed (convex). Inlet and outlet channels are usually absent. If known, pH of peat is <4.0.	0	
		A2. Not A1. Surface water, if present, has pH typically >4.5 and conductivity is usually >100 µS/cm (>64 ppm TDS). Sedge cover is usually extensive, and/or tree and tall shrub cover is extensive. Sometimes at toe of slope or edge of water body. An exit channel is usually present. Wetter than A1 and peat depth may be shallower (<2 m).	0	
		B. Moss and/or lichen cover less than 25% of the ground. Soil is mineral or decomposed organic (muck). Choose between B1 and B2 and mark the choice with a 1 in their adjoining column:		
		B1. Trees and shrubs taller than 1 m comprise more than 25% of the vegetated cover. Surface water is mostly absent or inundates the vegetation only seasonally (e.g., vernal pools or floodplain).	1	
		B2. Not B1. Tree & tall shrubs comprise less than than 25% of the vegetated cover. Vegetation is mostly herbaceous, e.g., cattail, burush, bureed, pond lily, horsetail. Surface water may be extensive and fluctuates seasonally, being either persistent or drying up partly or entirely.	0	
AA sh nclua ' adja descri	ould also include part of a e the open water part ad, cent " is used synonymo, bed features along their a	he AA should include all persistent waters in ponds smaller than 8 hectares (-283 m on a side) that are adjacent to the AA. The the water area of adjacent ponded water larger than 8 ha and adjacent rivers wider than 20 m. Specifically, the AA should jacent to wetland vegetation and equal in width to the average width of that vegetated zone. Throughout this data form, usly with abutiling, adjoining, bordering, contiguous – and means no upland (mammade or natural) completely separates the directly shared edge. Features joined only by a channel are not necessarily considered to be adjacent – a large portion of their res do not have to be hydrologically connected in order to be considered adjacent.		
2	Wetland Types - Adjoining or Subordinate	If the AA is smaller than 1 ha, mark all other types that occupy more than 1% of the vegetated AA. If the AA is larger than 1 ha, mark all other types which are within or adjacent to the AA and occupy more than 1 ha, as visible from the AA or as interpreted from aerial imagery. Do not mark again the type marked in F1.		1 hectare is 10,000 sq. m or about 2.5 acres. It could have dimensions of 100 m by 100 m, 1000 m by 10 m, or similar. [AM, INV, SBM, WBF]
		A1. A2.	0	
		B1.	0	
3	Woody Height & Form	B2. Following EACH row below, indicate with a number code the percentage of the living vegetation in the AA which is occupied by that feature (6	0	Deciduous shrubs in this region usually include buttonbush, Labrador tea, bayberry (Morella),
	Diversity	#. 95%, 5 # 75-95%, 4 # 50-75%, 3 # 25-05%, 2 # 5-25%, 1 # <5%, 0 if none). If the vegetated part of the AA is largely herbaceous (non-wood) vegetation, these percentages should not sum to 100%.	E	huckleberry, cranberry, cloudberry, sweetgale, alder, willow, birch, ash, dogwood, and a few others. If you assigned a code of 3 or higher to any of the first four choices and the ground cover beneath the trees/shrubs is <25% moss, then question F1 might be "B1". [CS, INV, NR, PH, POL, SBM, Sens]
		coniferous trees (may include tamarack) taller than 3 m. deciduous trees taller than 3 m.	5 1	
		conliferous or ericaceous shrubs or trees 1-3 m tall not directly below the canopy of trees. deciduous shrubs or trees 1-3 m tall not directly below the canopy of trees.	1	
		coniferous or ericaceous shrubs <1 m tall not directly below the canopy of taller vegetation.	1	
Vote:	If none of ton 4 rows in	deciduous shrubs or trees <1 m tall (e.g., deciduous seedlings) not directly below the canopy of taller vegetation. F3 was marked 2 or greater, SKIP to F9 (N fixers).		
4	Dominance of Most	Determine which two woody plant species comprise the greatest portion of the low (<3 m) woody cover. Then choose one:		[PH, POL, SBM, Sens]
	Abundant Shrub Species	those species together comprise > 50% of such cover.	1	
5	Woody Diameter Classes	those species together do not comprise > 50% of such cover. Mark ALL the types that comprise >5% of the woody canopy cover in the AA or >5% of the wooded areas (if any) along its upland edge (perimeter). The edge should include only the trees whose canopies extend into the AA.	0	Estimate the diameters at chest height. If small-diameter trees are overtopped (shaded) by larger ones, visualise a "subcanopy" at the average height of the smaller-dbh trees, to serve as a basis for t
		coniferous, 1-9 cm diameter and >1 m tall.	1	minimum 5% canopy requirement in this question. The trees and shrubs need not be wetland species [AM, CS, POL, SBM, Sens, WBN]
		broad-leaved deciduous 1-9 cm diameter and >1 m tall. coniferous, 10-19 cm diameter.	1	, , , , , , , , , , ,
		broad-leaved deciduous 10-19 cm diameter.	1	
		coniferous, 20-40 cm diameter. broad-leaved deciduous 20-40 cm diameter.	1	
		coniferous, >40 cm diameter.	1	
6	Height Class	broad-leaved deciduous >40 cm diameter. Follow the key below and mark the ONE row that best describes MOST of the AA:	0	[AM, INV, NR, PH, SBM, Sens]
Ū	Interspersion	A. Neither the vegetation taller than 1 m nor the vegetation shorter than that comprise >70% of the vegetated part of the AA. They <u>each</u> comprise 30-70%. Choose between A1 and A2 and mark the choice with a 1 in the adjoining column. Otherwise go to B below.		pan, me, m., m, son, son
		A1. The two height classes are mostly scattered and intermixed throughout the AA.	0	
		A2. Not A1. The two height classes are mostly in separate zones or bands, or in proportionately large clumps. B. Either the vegetation shorter than 1 m comprises > 70% of the vegetated part of the AA, or the vegetation taller than that does. One size class might even be totally absent. Choose between B1 and B2 and mark the choice with a 1 in the adjoining column:	0	
		B1. The less prevalent height class is mostly scattered and intermixed within the prevalent one. B2. Not B1. The less prevalent height class is mostly located apart from the prevalent one, in separate zones or clumps, or is completely	1	
	Lorgo Char- (D)	absent.	U	Spage are dead standing trace that often (not always) lead had and fillers. Include:
	Large Snags (Dead Standing Trees)	The number of large snags (diameter >20 cm) in the AA plus adjacent upland area within 10 m of the wetland edge is: None, or fewer than 8/ hectare which exceed this diameter.	0	Snags are dead standing trees that often (not always) lack bark and foliage. Include only ones that ar at least 2 m tall. [POL, SBM, WBN]
7		None, or rewer than 87 nectare which exceed this diameter. Several (>8/hectare) and a pond, lake, or slow-flowing water wider than 10 m is within 1 km.	0	
7				
7		Several (>8/hectare) but above not true.	1	
8	Downed Wood		0	Exclude temporary "burn piles." [AM, INV, POL, SBM]

FieldF form - Non-tidal Page 1 of 5

FO	N Fixers	The percentage of the AA's vegetated cover that contains nitrogen-fixing plants (e.g., alder, sweetgale, clover, lupine, alfalfa, other legumes)		Do not include N-fixing algae or lichens. [FA, FR, INV, NRv, OE, PH, SBM, Sens]
1 7	IN FIXEIS	is:		DO NOT INCIDUDE NY INTINING ANGLE OF INCIDENTS. [F.A, F.N., INV., INV., O.E., F.N., SEIN, SEINS]
		<1% or none.	1	
		1-25% of the vegetated cover, in the AA or along its water edge (whichever has more).	0	
		25-50% of the vegetated cover, in the AA or along its water edge (whichever has more). 50-75% of the vegetated cover, in the AA or along its water edge (whichever has more).	0	
		>75% of the vegetated cover, in the AA or along its water edge (whichever has more).	0	
F10	Sphagnum Moss	The cover of Sphagnum moss (or any moss that forms a dense cushion many centimeters thick), including the moss obscured by taller		Exclude moss growing on trees and rocks. [CS, PH]
	Extent	sedges and other plants rooted in it, is:		
		<5% of the vegetated part of the AA.	0	
		5-25% of the vegetated part of the AA. 25-50% of the vegetated part of the AA.	0	
		50-95% of the vegetated part of the AA.	0	
		>95% of the vegetated part of the AA.	1	
F11	% Bare Ground &	Consider the parts of the AA that lack surface water at the driest time of the growing season. Viewed from directly above the ground layer, the		Thatch is dead plant material (stems, leaves) resting on the ground surface. Bare ground that is
	Thatch	predominant condition in those areas at that time is:		present under a tree or shrub canopy should be counted. Boulders count as bare ground. Wetlands with mineral soils and that are heavily shaded or are dominated by annual plant species tend to have
		Little or no (<5%) bare ground is visible between erect stems or under canopy anywhere in the vegetated AA. Ground is extensively blanketed by dense thatch, moss, lichens, graminoids with great stem densities, or plants with ground-hugging foliage.	1	more extensive areas that are bare during the early growing season. [AM, EC, INV, NR, OE, POL, PR,
				SBM, Sens]
		Slightly bare ground (5-20% bare between plants) is visible in places, but those areas comprise less than 5% of the unflooded parts of the	0	
		Much bare ground (20-50% bare between plants) is visible in places, and those areas comprise more than 5% of the unflooded parts of the	0	
		AA.		
		Other conditions.	0	
F12	Cround Irrogularity	Not applicable. Surface water (either open or obscured by emergent plants) covers all of the AA all the time. Imagine the AA without any living vegetation. Excluding the portion of the AA that is always under water, the number of hummocks, small pits,	0	The depressions may be of human or natural origin. [AM, EC, INV, NR, PH, POL, PR, SBM, SR, WS]
F12	Ground Irregularity	raised mounds, animal burrows, ruts, gullies, natural levees, microdepressions, and other areas of peat or mineral soil that are raised or		The depressions may be of numan of natural origin. [AW, EC, MV, MR, PH, POL, PR, Solvi, SR, WS]
		depressed >10 cm compared to most of the area within a few meters surrounding them is:		
		Few or none (minimal microtopography; <1% of the land has such features, or entire AA is always water-covered).	0	
		Intermediate.	1	
F13	Unland Industry	Several (extensive micro-topography). Mithin the AA inclusions of unland are:	0	[AM, NR, SBM]
F13	Upland Inclusions	Within the AA, inclusions of upland are:		[Min, Min, John]
		Few or none.	1	
		Intermediate (1 - 10% of vegetated part of the AA). Many (e.g., wetland-upland "mosaic", >10% of the vegetated AA).	0	
F14	Soil Texture	In parts of the AA that lack persistent water, the texture of soil in the uppermost layer is mostly: [To determine this, use a trowel to check in at	Ů	[CS, NR, OE, PH, PR, Sens, SFS, WS]
		least 3 widely spaced locations, and use the soil texture key (in Appendix A of the Manual).]		
		Loamy: soils that may contain a little fine grit and do not make a "ribbon" longer than 2 cm when moistened, rolled, squeezed, and extended	0

FieldF form - Non-tidal Page 3 of 5

F37	Interspersion of	During most of the part of the growing season when water is present, the spatial pattern of emergent vegetation within the water is mostly:		[AM, FA, FR, INV, NR, OE, PH, PR, SBM, SR, WBF, WBN]
	Emergents & Open Water	Scattered. More than 30% of such vegetation forms small islands or corridors surrounded by water.	0	
	water	Intermediate.	0	
		Clumped. More than 70% of such vegetation is in bands along the wetland perimeter or is clumped at one or a few sides of the surface water area.	0	
F38	Persistent Deepwater	If the deepest paich of surface water (flowing or ponded) in or directly adjacent to the AA is mostly deeper than 0.5 m for >2 weeks during the growing season, enter *1* and continue. If not, enter *0* and SKIP to F42 (Connection).	0	
F39	Area Non-vegetated Aquatic	During most of the growing season and in waters deeper than 0.5 m, the cover for fish, aquatic invertebrates, and/or amphibians that is		For this question, consider only the wood that is at or above the water surface. Estimates of underwater
	Cover	provided NOT by living vegetation, but by accumulations of dead wood and undercut banks is:		wood based only on observations from terrestrial viewpoints are unreliable so should not be attempted. [AM, FA, FR, INV]
		Little or none. Intermediate.	0	[Pag, 17, 115, 114]
E40	In elekt of televisid	Extensive.	0	DAMAN
F40	Isolated Island	The AA contains (or is part of) an island or beaver lodge within a lake, pond, or river, and is isolated from the shore by water depths > 1 m on all sides during an average June. The island may be solid, or it may be a floating vegetation mat that is sufficiently large and dense to support a waterbird nest.	0	[WBN]
	Duckweed	At some time of the year, mats of algae and/or duckweed are likely to cover >50% of the AA's otherwise-unshaded water surface, or blanket >50% of the underwater substrate. If true, enter "1" in next column. If untrue or uncertain, enter "0".	0	[EC, PR, WBF]
F42	Channel Connection & Outflow Duration	The most persistent surface water connection (outlet channel or pipe, ditch, or overbank water exchange) between the AA and a downslope stream network is: [Note: If the AA represents only part of a welland, answer this according to whichever is the least permanent surface connection: the one between the AA and the rest of the wetland, or the surface connection between the wetland and the downslope stream network.] Persistent (surface water flows out for >9 months/year).	0	Consider the connection regardless of whether the surface water is frozen. The "downslope stream network" could consist of ditches, rivers, ponds, or lakes which eventually connect to the ocean. If this cannot be determined while visiting the AA, consult topographic maps perhaps by viewing these online with Toporama (http://atlas.nrcan.gc.ca/toporama/en/index.html) [CS, FA, FR, NR, OE, PR, Sens, SFS SR, WCv, WS]
		Seasonal (surface water flows out for 14 days to 9 months/year, not necessarily consecutive).	1	
		Temporary (surface water flows out for <14 days, not necessarily consecutive). None but maps show a stream network downslope from the AA and within a distance that is less than the AA's length. SKIP to F47 (pH	0	
		Measurement).		
		No surface water flows out of the wetland except possibly during extreme events (<once (ph="" 10="" a="" an="" ditch,="" f47="" flows="" into="" lacks="" lake="" measurement).<="" only="" or="" or,="" outlet.="" per="" skip="" td="" that="" to="" water="" wetland,="" years).=""><td>0</td><td></td></once>	0	
F43	Outflow Confinement	During major runoff events, in the places where surface water exits the AA or connected waters nearby, the water:	Ŷ	"Major runoff events" would include biennial high water caused by storms and/or rapid snowmelt. [CS, NR, OE, PR, Sens, SR, STR, WS]
		Mostly passes through a pipe, culvert, narrowly breached dike, berm, beaver dam, or other partial obstruction (other than natural topography) that does not appear to drain the wetland artificially during most of the growing season.	0	
		Leaves through natural exits (channels or diffuse outflow), not mainly through artificial or temporary features. Is exported more quickly than usual due to ditches or pipes within the AA or connected to its outlet, or within 10 m of the AA's edge, which	0	
F44		drain the wetland artificially, or water is pumped out of the AA.	Ü	
F44	Tributary Channel	At least once annually, surface water from a tributary channel that is >100 m long moves into the AA. Or, surface water from a larger permanent water body adjacent to the AA spills into the AA. If it enters only via a pipe, that pipe must be fed by a mapped stream or lake further upslope. If no, SKIP to F47 (pH Measurement).	0	If inlet tributaries cannot be searched for due to inaccessibility of part of the AA, follow suggestions in F42 above. [NRv, PH, PRv, SRv]
F45	Input Water Temperature	Based on lack of shade, water source characteristics, or actual temperature measurements, the inflow is likely to be warmer than surface water in the AA during part of most years. Enter 1= yes, 0= no.	0	[WCv]
F46	Throughflow	During its travel through the AA at the time of peak annual flow, water arriving in channels: [select only the ONE encountered by most of the incoming water].		[FA, FR, INV, NR, OE, PR, SR, WS]
	Resistance	Does not bump into many plant stems as it travels through the AA. Nearly all the water continues to travel in unvegetated (often incised) channels that have minimal contact with wetland vegetation, or through a zone of open water such as an instream pond or lake.	0	
			_	
		Bumps into herbaceous vegetation but mostly remains in fairly straight channels. Bumps into herbaceous vegetation and mostly spreads throughout, or is in widely meandering, multi-branched, or braided channels.	0	
		Bumps into tree trunks and/or shrub stems but mostly remains in fairly straight channels.	0	
		Bumps into tree trunks and/or shrub stems and follows a fairly indirect path from entrance to exit (meandering, multi-branched, or braided).	0	
F47	pH Measurement	The pH in most of the AA's surface water:		Preferably, measure this in larger areas of ponded surface water within the AA, or in streams that have
		Was measured, and is: [enter the reading in the column to the right.]		passed through (not along) most of the AA. Unless surface water is completely absent, do not dig holes or make depressions in peat in order to provide water for this measurement. Avoid measuring near
		Was not measured but surface water is present and is darkly tea-coloured. Or if no surface water, then mosses and plants that indicate pealland (e.g., Labrador tea) are prevalent. Enter *11. Neither of above. Enter *11.	0	roads or in puddles formed only by recent rain. [AM, FA, FR, NR, WBF, PH, PR, Sens, WBF, WBN]
F48	TDS and/or	The TDS (total dissolved solids) or conductivity off the AA's surface water is: (select the first true row with information):		See above for measurement guidance. [FR, INV, NRv, PH, PRv, Sens]
	Conductivity	TDS is: [Enter the reading in ppm or mg/L in the column to the right, if measured, or answer next row.]		
		Conductivity is [Enter the reading in µS/cm in the column to the right.] Was not measured, but plants that indicate saline conditions cover much of the vegetated AA. Enter *1*.	0	
		Neither of above	1	
F49	Beaver Probability	Use of the AA by beaver during the past 5 years is (select most applicable ONE):	0	[FA, FR, PH, SBM, Sens, WBF, WBN]
		Evident from direct observation or presence of gnawed limbs, dams, tracks, dens, lodges, or extensive stands of water-killed trees (snags).	0	
		Likely based on known occurrence in the region and proximity to suitable habitat, which may include: (a) a persistent freshwater wetland, pond, or lake, or a perennial low or mid-gradient (<10%) channel, and (b) a corridor or multiple stands of hardwood trees and shrubs in vegetated areas near surface water.	0	
FEO	Croundy-t C:	Unlikely because site characteristics above are deficient, and/or this is a settled area or other area where beaver are routinely removed.	1	Adhere to there exists existing strictly do not we record induced to the control of the control
F50	Groundwater Strength of Evidence	Select first applicable choice: Springs are known to be present within the AA, or if groundwater levels have been monitored, that has demonstrated that groundwater primarily discharges to the wetland for longer periods during the year than periods when the wetland recharges the groundwater.	0	Adhere to these criteria strictly do not use personal judgment based on fen conditions, pH, or other evidence. Consult loggraphic maps to detect breaks in slope described here. Rust deposits associated with groundwater seeps may be most noticeable as orange discoloration in ice formations along streams during early winter. [AM, CS, FA, FR, INV, NR, OE, PH, PRV, SFS, WC, WS]
		Most of the AA has a slope of >5%, or is very close to the base of a natural slope longer than 100 and much steeper than the slope of the AA, AND the pH of surface water, if known, is >5.5.	0	
FE1	Internal Cradition	Neither of above is true, although some groundwater may discharge to or flow through the AA. Or groundwater influx is unknown.	1	This is not the come as the charaline clane. It is the about 125
F51	Internal Gradient	The gradient along most of the flow path within the AA is: % or the AA has no surface water outlet (not even seasonally).</p	1	This is not the same as the shoreline slope. It is the elevational difference between the AA's inlet and outlet, divided by the flow-distance between them and converted to percent. If available, use a
		4. Or the AA has no surface water outlet (not even seasonally). 2-5%.	0	clinometer to measure this. Free clinometer apps can be downloaded to smartphones. If the wetland is large (longer than -1 km), this may be estimated using Google Earth to determine the minimum and
		6-10%. >10%.	0	maximum elevation within the AA, then dividing by length and multiplying by 100. [CS, NR, OE, PR, SR, WBF, WBN, WS]
Note fo	or the next three quest	>10%. ions: If the AA lacks an upland edge, evaluate based on the AA's entire perimeter, and moving outward into whatever areas are	0	ן אינון אינון, אינון
adjacei	nt. In many situations, th	nese questions are best answered by measuring from aerial images.		IAM FA FD INV NDv DH DOL DDv CDM Cone CDv CTD M/DMI
F52	Vegetated Buffer as % of Perimeter	Within a zone extending 30 m laterally from the AA's edge with upland and/or other wetlands, the percentage that contains perennial vegetation cover (except lawns, row crops, heavily grazed land, conifer plantations) is:		[AM, FA, FR, INV, NRv, PH, POL, PRv, SBM, Sens, SRv, STR, WBN]
		<5%.	0	
		5 to 30%. 30 to 60%.	0	
		60 to 90%. >90%, or all the area within 30 m of the AA edge is other wetlands. SKIP to F55.	0	

FieldF form - Non-tidal Page 4 of 5

53	Type of Cover in Buffer	Within 30 m upslope of where the wetland transitions to upland, the upland land cover that is NOT perennial vegetation is mostly (mark ONE):		[AM, FA, INV, NRv, PH, POL, SBM, STR, WBN]
	Type or devel in Buner			
		Impervious surface, e.g., paved road, parking lot, building, exposed rock.	0	
		Bare or nearly bare pervious surface or managed vegetation, e.g., lawn, row crops, unpaved road, dike, landslide.	0	
54	Buffer Slope	The steepest and/or most disturbed part of the upland area that is within 30 m of the wetland and occupies >10% of that upland area has a percent slope of:		[NRv, PRv, Sens, SRv]
		<1% (flat almost no noticeable slope) or all the area within 30 m of the AA edge is other wetlands.	0	
		2-5%.	0	
		5-30%. >30%.	0	4
55	Cliffs or Steep Banks	>30%. In the AA or within 100 m, there are elevated terrestrial features such as cliffs, talus slopes, stream banks, or excavated pits (but not riprap)	0	Do not include upturned trees as potential den sites. [POL, SBM]
33	Cilis of Steep Baliks	In the zero of within 1 on, interest are expensed terrestation readines such as callos, made subjects, suream contrast, or exercised pins Quintingrapy that extend at least 2 m nearly vertically, are unvegetated, and potentially contain crevices or other substrate suitable for nesting or den areas. Enter 1 (yes) or 0 (no).	0	DO NOI INCIDURE UPERS AS POTENTIAL DEL SILES. [F.O.L., DUM]
56	New or Expanded Wetland	Human actions within or adjacent to the AA have persistently expanded a naturally occurring wetland or created a wetland where there previously was none (e.g., by excavation, impoundment):		Determine this using historical aerial photography, old maps, soil maps, or permit files as available [C NR, OE, PH, Sens]
		No.	1

FieldS form Non-tidal 2

Assessment Area (AA) Results:

Wetland ID: PH-W-07

Date: 6 August 2020

Observer: Derrick Mitchell

Latitude & Longitude (decimal degrees): 45.204537, -66.188376

Scores will appear below after data are entered in worksheets OF, F, and S. See Manual for definitions and descriptions of how scores were computed.

сотралеа.						
Wetland Functions or Other Attributes:	Function Score (Normalised)	Function Rating	Benefits Score (Normalised)	Benefits Rating	Function Score (raw)	Benefits Score (raw)
Water Storage & Delay (WS)	5.27	Higher	1.68	Lower	5.79	1.75
Stream Flow Support (SFS)	3.13	Moderate	7.65	Higher	1.67	4.46
Water Cooling (WC)	0.00	Lower	0.00	Lower	0.00	0.00
Sediment Retention & Stabilisation (SR)	5.94	Higher	0.73	Lower	7.22	0.44
Phosphorus Retention (PR)	5.54	Higher	0.37	Lower	6.83	0.67
Nitrate Removal & Retention (NR)	2.84	Moderate	1.25	Lower	5.58	2.22
Carbon Sequestration (CS)	8.91	Higher			8.41	
Organic Nutrient Export (OE)	5.32	Higher			5.16	
Anadromous Fish Habitat (FA)	0.00	Lower	0.00	Lower	0.00	0.00
Resident Fish Habitat (FR)	0.00	Lower	0.00	Lower	0.00	0.00
Aquatic Invertebrate Habitat (INV)	5.40	Moderate	0.73	Lower	5.77	1.64
Amphibian & Turtle Habitat (AM)	2.48	Lower	3.07	Moderate	4.61	3.96
Waterbird Feeding Habitat (WBF)	0.00	Lower	0.00	Lower	0.00	0.00
Waterbird Nesting Habitat (WBN)	0.00	Lower	0.00	Lower	0.00	0.00
Songbird, Raptor, & Mammal Habitat (SBM)	6.28	Moderate	6.67	Moderate	5.20	6.67
Pollinator Habitat (POL)	9.57	Higher	6.67	Moderate	7.71	6.67
Native Plant Habitat (PH)	6.76	Higher	7.52	Higher	5.81	6.53
Public Use & Recognition (PU)			2.15	Lower		1.86
Wetland Sensitivity (Sens)			0.95	Lower		2.49
Wetland Ecological Condition (EC)			7.83	Higher		8.75
Wetland Stressors (STR) (higher score means more stress)			0.22	Lower		2.34
Summary Ratings for Grouped Functions:						
HYDROLOGIC Group (WS)	3.13	Moderate	1.68	Lower	5.79	1.75
WATER QUALITY SUPPORT Group (max+avg/2 of SR, PR, NR, CS)	5.36	Moderate	1.02	Lower	7.71	1.67
AQUATIC SUPPORT Group (max+avg/2 of SFS, INV, OE, WC)	4.43	Moderate	5.22	Higher	4.46	3.25
AQUATIC HABITAT Group (max+avg/2 of FA, FR, AM, WBF, WBN)	1.49	Lower	1.84	Lower	2.77	2.37
TRANSITION HABITAT Group (max+avg/2 of SBM, PH, POL)	8.55	Higher	7.24	Higher	6.98	6.64
WETLAND CONDITION (EC)			7.83	Higher		8.75
WETLAND RISK (average of Sensitivity & Stressors)			0.58	Lower		2.41
	NOTE A	101			1 11	41 1 14

NOTE: A score of 0 does not mean the function or benefit is absent from the wetland. It means only that this wetland has a capacity that is equal or less than the lowest-scoring one, for that function or benefit, from among the 98 NB calibration wetlands that were assessed previously.

Cover Page: Basic Description of Assessment	WESP-AC version 2
Site Name:	Burchill Wind Energy Project - PH-W-08
Investigator Name:	Derrick Mitchell
Date of Field Assessment:	6 August 2020
Nearest Town:	Lorneville (west Saint John), New Brunswick
Latitude (decimal degrees):	45.206996
Longitude (decimal degrees):	
Is a map based on a formal on-site wetland delineation available?	Yes
Approximate size of the Assessment Area (AA, in hectares):	0.89
AA as percent of entire wetland (approx.). Attach sketch map if AA is smaller than the entire contiguous wetland.	
What percent (approx.) of the wetland were you able to visit?	100
What percent (approx.) of the AA were you able to visit?	100
Were you able to ask the site owner/manager about any of the questions?	No
Indicate here if you intentionally surveyed for rare plants, calciphile plants, or rare animals:	Yes
Have you attended a WESP-AC training session? If so, indicate approximate month & year.	Yes, September 2016
How many wetlands have you assessed previously using WESP-AC? (approx.)	100+
Comments about the site or this WESP-AC assessment (attach extra page if desired):	

Form OF (Office). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Conduct an assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answering many of the questions below will equire using these online map viewers:

Google Earth Pro: https://www.google.com/earth/download/gep/agree.html

GeoNB: http://www.snb.ca/geonb1/ and http://www.snb.ca/geonb1/e/apps/apps-E.asp

Geons: http://www.snb.ca/geonol/ and http://www.snb.ca/geonol/e/apps/apps/apps-e.asp
For most wetlands, completing this office data form will require 1-2 hours. For a list of functions to which each question pertains, see bracketed abbreviations in the Definitions/Explanations column. For detailed descriptions of each
WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus
Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding
Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity,

#	Indicators	Condition Choices	Data	Definitions/Explanations
F1	Province	Mark the province in which the AA is located by changing the 0 in the column next to it to a "1". Mark only one.		This determines to which province's calibration wetlands the raw score of any wetland is normalised
		New Brunswick	- 1	In the function and benefits models, it also triggers the automatic exclusion of indicators for which no spatial data exists in a particular province.
		Nova Scotia	0	
		Prince Edward Island	0	
		Newfoundland-Labrador	0	
)F2	Ponded Area Within 1 km.	The area of surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) within 1 km is:		"Adjacent" means not separated from the AA by a wide expanse (>50 m) of upland (including roar >50 m wide). Include ponded areas likely to be hidden by wetland vegetation. If surface water
		<0.01 hectare (about 10 m x 10 m).	0	extends beyond 1 km, include only the part within 1 km. Do not include tidal areas. Measure the a from aerial imagery using Google Earth Pro (click on Ruler icon in toolbar, then Polygon in pop-up
		0.01 - 0.1 hectare.	0	menu). With the GeoNB viewer, enable the Wetlands layer, then measure with the Draw & Measu
		0.1 - 1 hectare.	0	tool after specifying Aerial as the Basemap. However, do not rely entirely on wetland boundaries
		1 to 10 hectares.	0	shown in online wetlands layers. [PH, SBM, WBN]
		10 to 100 hectares.	0	
3	Ponded Water & Wetland Within 1 km.	>100 hectares. The area of wetlands and surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) with 1 km is:	0 in	See definition of adjacent in OF2. If the AA's wetland vegetation extends beyond 1 km, include or the part within 1 km. "Ponded" means not flowing in rivers or streams. [Sens, WBF]
			0	
		<0.01 hectare (about 10 m x 10 m). 0.01 - 0.1 hectare.	0	-
		0.1 - 1 hectare.	0	=
		1 to 10 hectares.	0	
		10 to 100 hectares.	1	
		>100 hectares.	0	
4	Size of Largest Nearby	The largest vegetated patch or corridor that includes the AA's vegetation plus aladjacent upland vegetation that is not lawn, row crops,		See definition of adjacent in OF2. Use Google Earth Pro's polygon ruler (as described above).
	Vegetated Tract or	heavily grazed lands, conifer plantation is:		Exclude conifer plantations only if it is obvious that trees were planted in rows. [AM, PH, SBM, Set
	Corridor	<0.01 hectare (about 10 m x 10 m).	0	
		0.01 - 0.1 hectare.	0	1
		0.1 - 1 hectare.	0	
		1 to 10 hectares.	0	
		10 to 100 hectares.	0	
		100 to 1000 hectares.	1	
		>1000 hectares. [This is nearly always the answer in relatively undeveloped landscapes]	0	
5	Distance to Large Vegetated Tract	The minimum distance from the edge of the AA to the edge of the closest vegetated land (but excluding row crops, lawn, conifer plantation) larger than 375 hectares (about 2 km on a side), is:		To measure distance, use Google Earth Pro (Ruler > Line tool). Or use Draw & Measure tool at GeoNB. The 375-ha criterion is from the Fundy Model Forest Project. [AM, PH, POL, SBM, Sens]
		-60 m, and not separated from the 375-ha vegetated area by any width obaved roads, streiches of open water, row crops, bare ground, lawn, or impervious surface. Or the AA itself contains >375 ha of vegetation. [This is often the answer in relatively undeveloped landscap		
		<50 m, but completely separated from the 375-ha vegetated area by those features, and AA does not contain >375 ha of vegetation.	0	
		50-500 m, and not separated.	0	
		50-500 m, but separated by those features.	0	
		0.5 - 5 km, and not separated.	0	4
		0.5 - 5 km, but separated by those features.	0	
6	Herbaceous Uniqueness	None of the above (the closest patches or corridors which are that large are >5 km away). The AA's vegetation cover is >10% herbaceous* but uplands within 5 km have <10% herbaceous cover. If so, enter "3" and continue to	0	For this question only, consider moss to be herbaceous vegetation. Determine the score by viewi
	Tobaccas on quantity	OF7. If not, consider: The AA's vegetation cover is >10% herbaceous* but uplands within 1 km have <10% herbaceous cover. If so enter "2" and continue to OF7. If not, consider: The AA's vegetation cover is >10% herbaceous* but uplands within 100 m of the wetland edge have <10% herbaceous cover. If so, enter 1". "NOTE: Exclude lawns, row crops, heavily grazed lands, forest, shrublands. Include moss as well as grasslike plants in this use of "herbaceous vegetation"]	er	aerial imagery in Google Earth after successively drawing or estimating the boundaries of the buff of 5 km, 1 km, and 100 m radius focused on the center of the AA. Circles of specified radius can I drawn in Google Earth Pro by clicking on the Ruler icon, then Circle in the pop-up menu. [AMv, P POLv, SBMv, WBFv, WBNv]
-7	Woody Uniqueness	The AA's vegetation cover is >10% woody" but uplands within 5 km have <10% woody cover. If so, enter "3" and continue to OF8. If not	, 2	See above. Do not consider conifer plantations to be forest if it is obvious that trees were planted i
		consider: The AA's vegetation is >10% woody* but uplands within 1 km have <10% woody cover. If so enter "2" and continue to OF8. If not, consider:		rows. [AMv, PHv, POLv, SBMv]
		Curisuer. The AA's vegetation is >10% woody* but uplands within 100 m of the wetland edge have <10% woody cover. If so, enter "1" ["NOTE: woody cover = trees & shrubs taller than 1 m.]		
8	Local Vegetated Cover Percentage	Draw a 5-km radius circle measured from the center of the AA. Ignoring all permanent water in the circle, the percent of the remaining at that is wooded or unmanaged herbaceous vegetation (NOT lawn, row crops, bare or heavily grazed land, clearcuts, or confer plantations.		In Google Earth, draw the 5 km buffer and then estimate land cover percentages, or do GIS analys of an appropriate land cover layer. [AM, PH, POL, SBM, Sens]
		LSV of the lead	_	
		<5% of the land. 5 to 20% of the land.	0	-
		20 to 60% of the land.	0	1
		60 to 90% of the land.	0	1
		>90% of the land. SKIP to OF10.	1	1
9	Type of Land Cover	Within the 5-km radius circle, and ignoring all permanent water, the land area that is bare or non-perennial cover is mostly:		[AM, SBM]
	Alteration	2 2 1		
		Impervious surface, e.g., paved road, parking lot, building, exposed rock.	0	4
	0.1	Bare pervious surface, e.g., lawn, recent (<5 yrs ago) clearcut, dirt or gravel road, cropland, landslide, conifer plantation.	0	
10	Distance by Road to Nearest Population	Measured along the maintained road nearest the AA, the distance to the neares population center is:		"Population center" means a settled area with more than about 5 regularly- inhabited structures pe square kilometer. In Google Earth, click on the Ruler icon, then Path, and draw and measure the
	Center	<100 m.	0	square knometer. In Google Earth, click on the Ruler Icon, then Path, and draw and measure the route. Or use the GeoNB's Draw & Measure tool> Freehand Line to draw and measure the route.
		100 - 500 m.	0	Settlements (click on Place Names in menu) or other areas not close to mapped settlements but
		0.5- 1 km.	0	which meet the criteria.[FAv, FRv, NRv, PH, PU, SBM, WBFv]
		1 - 5 km. >5 km.	0	

OF11	Distance to Nearest	From the center of the AA, the distance to the nearest maintained public road (dirt or paved) is:		Determine this by viewing aerial imagery in Google Earth and measuring with the Ruler>Line tool. Or
	Maintained Road	<10 m.	0	use the GeoNB's Draw Line tool. [AM, FAv, FRv, NRv, PH, PU, SBM, STR, WBN]
		10 - 25 m.	0	
	F12 Wildlife Access	25 - 50 m.	0	
		50 - 100 m. 100 - 500 m.	0	
		>500 m.	0	
OF12	Wildlife Access	Draw a circle of radius of 5 km from the center of the AA. If mammals and amphibians can move from the center of the AA to ALL other separate wetlands and ponds located within the circle without being forced to cross pavement (any width), lawns, bare ground, and/or marine waters, mark 1= yes can move to all, 0= no. Change toblank if there are no other wetlands within 5 km.	0	In NB, enable the Wetlands layer in GeoNB (despite its omissions) to show surrounding wetlands and roads, while estimating the location of the 5 km circle (or draw the 5 km circle in Google Earth Pro using the Circle tool and compare). Evaluate using Google Earth, being cautious to search for roads
				hidden under forest canopy. [AM, SBM, STR]
OF13	Distance to Ponded Water	The distance from the AA center to the closest (but separate) ponded water body visible in GoogleEarth imagery is:		In Google Earth, zoom in closely to examine the surrounding landscape for ponds, lakes, and wetlands that appear to be permanently flooded. Enable the GeoNB viewer's Wetlands layer as well
	Truitos	450 m, and not separated by any width of paved roads, stretches of open water, row crops, lawn, bare ground, or impervious surface.	0	[AM, PH, SBM, Sens, WBF, WBN]
		<50 m, but completely separated by those features. 50-500 m, and not separated.	0	
		50-500 m, but separated by those features.	0	
		0.5 - 1 km, and not separated.	0	
		0.5 - 1 km, but separated by those features.	0	
		None of the above (the closest patches or corridors that large are >1 km away).	0	
OF14	Distance to Large Ponded Water	The distance from the AA center to the closest (but separate)non-tidal body of water that is ponded during most of the year and islarger than 8 hectares during most of a normal year is:		Determine this by viewing aerial imagery in Google Earth. [Sens, WBF, WBN]
		<100 m.	0	
		100 m - 1 km. 1 - 2 km.	0	
		2.5 km.	0	
		5-10 km.	0	
		>10 km.	0	
OF15	Tidal Proximity	The distance from the AA edge to the closesttidal water body (regardless of its salinity) is:		In Google Earth, measure the distance to the ocean (including Bay of Fundy) or tidal river, whichever
		<100 m.	0	is closer. If you need to see how far upriver a river is tidal, see the KMZ file provided with this calculator for NB (NB Headtide). Points shown in those files are only an approximation, so local
		100 m - 1 km.	0	information if available may be preferable. [FA, WBF]
		1 - 5 km.	1	
		5-10 km.	0	
OF16		10-40 km.	0	
	Upland Edge Contact	Select one:	U	[NR, SBM, Sens]
01 10	opiana Eage Contact	The AA has no upland edge (or upland is <1% of perimeter). The AA is entirely surrounded by (& contiguous with) other wetlands or water	0	pro, John, John
		1-25% of the AA's perimeter abuts upland (including filled areas). The rest adjoins other wetlands or water that is mostly wider than the AA	0	
		25-50% of the AA's perimeter abuts upland. The rest adjoins other wetlands or water that is mostly wider than the AA.	0	
		50-75% of the AA's perimeter abuts upland. The rest adjoins other wetlands or water that is mostly wider than the AA.	0	
		More than 75% of the AA's perimeter abuts upland. Any remainder adjoins other wetlands or water that is mostly wider than the AA.This	1	
0547	EL 18 6 N	will be true for most assessments done with WESP-AC.		
OF17	Flood Damage from Non- tidal Waters			In the GeoNB map viewer: click on "More" in upper right, then "Flood Information". Expand the menu under it by clicking on the arrow to its left and the slider to its right. Uncheck the first (Limits of Data)
	rua maiors	Maps show Flood Zone or Flood Risk areas and there appears to be infrastructure vulnerable to river flooding not caused by Iidal storm surges.	0	box. Where available, LIDAR imagery can provide finer elevational resolution useful for flood modeling, [WSv]
		Maps show Flood Zone or Flood Risk areas, but infrastructure is absent or is not vulnerable to floods from a non-tidal river. In some cases levees, upriver dams, or other measures may partly limit damage or risk from smaller events.	0	
		Maps do not show Flood Zone or Flood Risk areas (or no such mapping has been done locally) and there appears to be infrastructure	0	
		vulnerable to river flooding unrelated to tidal storm surges.		
		Maps do not show Flood Zone or Flood Risk areas (or no such mapping has been done locally) and there isno infrastructure vulnerable to river flooding unrelated to tidal storm surges.	1	
OF18	Relative Elevation in Watershed	In Google Earth, enable the Terrain layer (lower left menu) and open the NB_Watersheds KMZ file that accompanies this calculator. Then determine the AA's approximate elevation (bottom right, NOT the "eye alt"). Then move cursor around to determine the watershed's maximum and minimum elevation. Divide the AA's elevation by the (max-min).	0.65	[FA, NR, Sens, SFSv, WCv, WSv]
OF19	Water Quality Sensitive Watershed or Area	In Google Earth, open the KMZ file NB_Watershed Protected Area which accompanies this calculator. The AA is within such an area. Enter 1= yes, 0= no.	0	If an ACCDC report is available for this AA, it also may contain such information. [NRv]
OF20	Degraded Water	Sampling indicates a problem with concentrations of metals, hydrocarbons, nutrients, or other substances (excluding bacteria, acidic		May use existing data, or sample those waters as part of this wetland assessment. "Harmful" should
	Upstream	water, high temperatures) being present at levels harmful to aquatic life or humans, and:		be evaluated with regard to current federal or provincial water quality standards. [AM, FA, FR, NRv, PRv, SRv, STR, WBF, WBN]
		The condition is present within the AA. The condition is present in waters within 1 km that flowinto the AA, but has not been documented in the AA itself.	0	,,,,
		The condition is present in waters within 1 km that flowinto the AA, but has not been documented in the AA itself. Sampling during both low water periods and times with high runoff (storms, snowmelt) indicates no problems in either the AA or inflowing	0	
		paripling utiling both low water periods and times with high runon (storms, showner) indicates no problems in either the AA or inhowing waters.	L	
		Data are insufficient (no or inadequate sampling within 1 km, or condition exists only at >1 km upstream)This is the situation for nearly all wetlands in this region.	1	
OF21	Degraded Water	The problem described above is downslope from the AA, and:		May use existing data, or monitor waters as part of this wetland assessment. [NRv, PRv, SRv]
	Downstream	The condition is present within 1 km downslope and connected to the AA by a channel.	0	
		The condition is present within 5 km downslope and connected to the AA by a channel, or within 1 km but not connected to the AA by a	0	
		channel.		
		Sampling during both low water periods and times with high runoff (storms, snowmelt) indicates no problems in either the AA or inflowing waters.	0	
		Data are insufficient (no or inadequate sampling within 1 km, or condition exists only at >1 km upstream) This is the situation for nearly all wetlands in this region.	1	
OF22	Wetland as a % of Its	From a topographic map and field observations, estimate the approximate boundaries of the catchment (CA) of the entire wetland of which		Topographic maps may be viewed online at the National Atlas of Canada (Toporama):
	Contributing Area (Catchment)	the AA may be only a part. Then adjust those boundaries if necessary based on your field observations of the surrounding terrain, and/or busing procedures described in the Manual. Divide the area of the wetland (not just the AA) by the approximate area of its catchment excluding the area of the wetland itself. When doing the calculation, if ponded water is adjacent to the wetland, include that in the wetland area. The result is:		http://atlas.gc.ca/loporama/en/index.html [NR, PR, Sens, SR, WS]
		<0.01, or catchment size unknown due to stormwater pipes that collect water from an indeterminate area.	0	
		0.01 to 0.1.	0	
		0.1 to 1.	1	
0.5		1 (wetland is larger than its calchment (e.g., wetland with flat surrounding terrain and no inlet, or is entirely isolated by dikes, or is a raised bog).	0	
OF23	Unvegetated Surface in the Contributing Area	The proportion of the AA's contributing area (measured to no more than 1000 m upslope) that is comprised of buildings, roads, parking tole other pavement, exposed bedrock, landslides, and other mostly-bare surface is about:		[FA, INV, NRv, PRv, SRv, STR, WCv, WSv]
		<10%. 10 to 25%.	0	
		>25%.	0	1
		P 40 70.	U	

OF24	Transport From Upslope	A relatively large proportion of the precipitation that falls farther upslope in the CA reaches this wetland quickly as runoff (surface water), a	9	[NRv, PRv, SRv, WSv]
		indicated by the following:		
		(a) input channel is present,		
		(b) input channels have been straightened, (c) upslope wetlands have been ditched extensively,		
		(d) land cover is mostly non-forest,		
		(e) CA slopes are steep, and/or		
		(f) most CA soils are shallow (bedrock near surface) and/or have high runoff coefficients.		
		This statement is:		
		Mostly true.	0	
		Somewhat true.	0	1
		Mostly untrue.	1	
OF25	Aspect	The overland flow direction of most surface water (in streams, rivers, or runoff) that enters the AA is:		[AM, NR, SFS, WC, WS]
01 23	парсы			[AIII, III., 31.3, II.0, II.3]
		Northward (N, NE). north-facing contributing area.	0	
		Southward (S, SW). south-facing contributing area.	1	
		Other (E, SE, W, NW), or no detectable uphill slope or input channel (flat).		
OF26	Internal Flow Distance	The horizontal flow distance from the wetland's inlet to outlet is:		Identify inlets and outlets, if any, from topographic maps (use elevations to determine which are inlet
	(Path Length)	10	0	and which are outlets) and augment by field inspection. [NR, OE, PR, SR, WS]
		<10 m.	0	
		10 - 50 m.	0	-
		50 - 100 m.	0	
		100 - 1000 m.	1	
		1- 2 km.	0	
		>2 km, or wetland lacks an inlet and outlet.	0	1
OF27	Growing Degree Days	In Google Earth, open the KMZ file that accompanies this calculator, called NB-PEI_GrowingDegreeDays. Place your cursor over the AA	0	This layer was provided by Dr. Dan McKenney of the Canadian Forest Service [AM, CS, FR, INV,
	, ,	and left-click. From the pop-up, enter the GRIDCODE in the next column.	2428	NR, OE, PH, PR, Sens, SR, WBF, WCv, WS]
OF28	Fish Access or Use	According to agency biologists and/or your own observations, the AA. [Nark just the first choice that is true.]:		Regarding the last choice, if uncertain if an AA is fishless, consider the possibility its waters have be
. 20				stocked. In NB, the list of stocked waters is at:
		is known to support rearing and/or spawning by Atlantic salmon or other anadromous species or eels. In NB, consult Figure A-2 in	0	http://www2.gnb.ca/content/gnb/en/departments/erd/natural_resources/content/fish/content/Stocked
		Appendix A of the Manual. Contact local fishery biologists, review the ACCDC report, and visit these websites:		aters.html
		http://www.salmonatlas.com/atlanticsalmon/canada-east/index.1.html http://atlanticsalmonfederation.org/rivers/introduction.html		[AM, FA, FR, INV, WBF, WBN]
		Has not been documented to support Atlantic salmon rearing and/or spawning, but is connected to nearby waters likely to contain Atlantic	0	
		salmon or other anadromous species or eels and is probably accessed by those during some conditions.		
		Is probably is not accessed by any anadromous fish species but is known or likely to hav other fish at least seasonally.	0	
		Is known or likely to be fishless (e.g., too small, dry, and/or not accessible even temporarily, and not stocked).	- 1	
OF29	Species of Conservation	Within the past 10 years, in the AA (or in its adjoining waters or wetland), qualified observers have documented mark all applicable:		Request information from ACCDC and/or conduct your own survey at an appropriate season using a
	Concern			approved protocol. For birds, also check eBird.org. [AMv, EC, PHv, POLv, SBMv, Sens, WBFv,

-------	-----------------	--------------------------	----------	------------	---------	--------------	---

Form F (Field). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Walk for no less than 10 minutes from the wetland edge towards its core, in the part of the AA that is proposed for alteration. If no alteration is proposed, walk in a portion that appears to be most representative of the wetland overall. Walk only where it is safe and legal to do so. Conduct the assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answer these questions primarily based on your onsite observations and interpretations. Do not write in shaded parts of this data form. Answering some questions accurately may require conferring with the landowner or other knowledgable persons and/or reviewing aerial imagery. For most wetlands, completing this field data form will require 1-2 hours on a site. For a list of functions to which each question pertains, see the accompanying Interpretations form. For detailed descriptions of each WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage & Delay, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity, STR= Stressors.

#				
"	Indicators	Condition Choices	Data	Definitions/Explanations
-1	Wetland Type	Follow the key below and mark the ONE row that best describes MOST of the vegetated part of the AA:		Ericaceous shrubs are ones in the heather family (Ericaceae). Most have leathery evergreen leaves. They include rhododendron, azalea, swamp laurel, leatherleaf, Labrador tea, and others. Most require
		A. Moss and/or lichen cover more than 25% of the ground. Often dominated by ericaceous shrubs (e.g., Labrador lea) or other acid-tolerant plants (e.g., bog cranberry, pilcher plant, sundew, orchids)s. Substrate is mostly undecomposed peat. Choose between A1 and A2 and mark the choice with a 1 in their adjoining column. Otherwise go to 8 below.		acidic soil. Although not in the family Ericaceae, sweetgale (Myrica gale) should be counted also. [AM, CS, FA, FR, INV, NR, OE, PH, Sens, SFS, WBF, WBN]
		A1. Surface water is usually absent or, if present, pH is typically <4.5 and conductivity is usually <100 µS/cm (<64 ppm TDS). Trees are absent or nearly so. Sedge cover usually sparse or absent but cottongrass and/or lichen cover may be extensive, as well as cloudberry, lingonberry, sheep laurel, and a sedge (Carex rarillora). Welland surface and surrounding landscape are seldom sloping and welland often is domed (convex). Inlet and outlet channels are usually absent. If known, pH of peat is <4.0.	0	
		A2. Not A1. Surface water, if present, has pH typically >4.5 and conductivity is usually >100 µS/cm (>64 ppm TDS). Sedge cover is usually extensive, and/or tree and tall shrub cover is extensive. Sometimes at loe of slope or edge of water body. An exit channel is usually present. Wetter than A1 and peat depth may be shallower (<2 m).	0	
		B. Moss and/or lichen cover less than 25% of the ground. Soil is mineral or decomposed organic (muck). Choose between B1 and B2 and mark the choice with a 1 in their adjoining column:		
		B1. Trees and shrubs taller than 1 m comprise more than 25% of the vegetated cover. Surface water is mostly absent or inundates the vegetation only seasonally (e.g., vernal pools or floodplain).	1	
		B2. Not B1. Tree & tall shrubs comprise less than than 25% of the vegetated cover. Vegetation is mostly herbaceous, e.g., cattail, butrush, burreed, pond lily, horsetail. Surface water may be extensive and fluctuates seasonally, being either persistent or drying up partly or entirely.	0	
AA sh includ " adja descri	ould also include part of e the open water part ad cent " is used synonymo bed features along their	The AA should include all persistent waters in ponds smaller than 8 hectares (-283 m on a side) that are adjacent to the AA. The the water area of adjacent ponded water larger than 8 ha and adjacent rivers wider than 20 m. Specifically, the AA should jacent to wetland vegetation and equal in width to the average width of that vegetated zone. Throughout this data form, usly with abutting, adjoining, bordering, contiguous and means no upland (manmade or natural) completely separates the directly shared edge. Features joined only by a channel are not necessarily considered to be adjacent a large portion of their es do not have to be hydrologically connected in order to be considered adjacent.		
-2	Wetland Types - Adjoining or Subordinate	If the AA is smaller than 1 ha, mark all other types that occupy more than 1% of the vegetated AA. If the AA is larger than 1 ha, mark all other types which are within or adjacent to the AA and occupy more than 1 ha, as visible from the AA or as interpreted from aerial imagery. Do not mark again the type marked in F1.		1 hectare is 10,000 sq. m or about 2.5 acres. It could have dimensions of 100 m by 100 m, 1000 m by 10 m, or similar. [AM, INV, SBM, WBF]
		A1. A2.	0	
		B1.	0	
-3	Woody Height & Form	B2. Following EACH row below, indicate with a number code the percentage of the living vegetation in the AA which is occupied by that feature (6	0	Deciduous shrubs in this region usually include buttonbush, Labrador tea, bayberry (Morella),
3	Diversity	if >95%, 5 if 75-95%, 4 if 50-75%, 3 if 25-50%, 2 if 5-25%, 1 if <5%, 0 if none). If the vegetated part of the AA is largely herbaceous (non-woody) vegetation, these percentages should not sum to 100%. coniferous trees (may include tamarack) taller than 3 m.	5	huckleberry, cranberry, cloudberry, sweetgale, alder, willow, birch, ash, dogwood, and a few others. If you assigned a code of 3 or higher to any of the first four choices and the ground cover beneath the trees/shrubs is <25% moss, then question F1 might be "B1". [CS, INV, NR, PH, POL, SBM, Sens]
		deciduous trees fundy include familiaracky familia fundi 3 m.	1	
		coniferous or ericaceous shrubs or trees 1-3 m tall not directly below the canopy of trees.	1	
		deciduous shrubs or trees 1-3 m tall not directly below the canopy of trees. coniferous or ericaceous shrubs <1 m tall not directly below the canopy of taller vegetation.	1	
		deciduous shrubs or trees <1 m tall (e.g., deciduous seedlings) not directly below the canopy of taller vegetation.	1	
Note :		F3 was marked 2 or greater , SKIP to F9 (N fixers).		
F4	Dominance of Most Abundant Shrub	Determine which two woody plant species comprise the greatest portion of the low (<3 m) woody cover . Then choose one: those species together comprise > 50% of such cover.	1	[PH, POL, SBM, Sens]
	Species	those species together do not comprise > 50% of such cover.	0	
75	Woody Diameter Classes	Mark ALL the types that comprise >5% of the woody canopy cover in the AA or >5% of the wooded areas (if any) along its upland edge (perimeter). The edge should include only the trees whose canopies extend into the AA.		Estimate the diameters at chest height. If small-diameter trees are overtopped (shaded) by larger ones, visualise a "subcanopy" at the average height of the smaller-dbh trees, to serve as a basis for th
		coniferous, 1-9 cm diameter and >1 m tall.	1	minimum 5% canopy requirement in this question. The trees and shrubs need not be wetland species [AM, CS, POL, SBM, Sens, WBN]

FieldF form - Non-tidal Page 3 of 5

F37	Interspersion of	During most of the part of the growing season when water is present, the spatial pattern of emergent vegetation within the water is mostly:		[AM, FA, FR, INV, NR, OE, PH, PR, SBM, SR, WBF, WBN]
	Emergents & Open Water	Scattered. More than 30% of such vegetation forms small islands or corridors surrounded by water.	0	
	water	Intermediate.	0	
		Clumped. More than 70% of such vegetation is in bands along the wetland perimeter or is clumped at one or a few sides of the surface water area.	0	
F38	Persistent Deepwater	If the deepest patch of surface water (flowing or ponded) in or directly adjacent to the AA is mostly deeper than 0.5 m for >2 weeks during the growing season, enter "1" and continue. If not, enter "0" and SKIP to F42 (Connection).	0	
F39	Area Non-vegetated Aquatic	During most of the growing season and in waters deeper than 0.5 m, the cover for fish, aquatic invertebrates, and/or amphibians that is		For this question, consider only the wood that is at or above the water surface. Estimates of underwater
	Cover	provided NOT by living vegetation, but by accumulations of dead wood and undercut banks is:		wood based only on observations from terrestrial viewpoints are unreliable so should not be attempted. [AM, FA, FR, INV]
		Little or none. Intermediate.	0	[AW, FA, FK, 11VV]
		Extensive.	0	
F40	Isolated Island	The AA contains (or is part of) an island or beaver lodge within a lake, pond, or river, and is isolated from the shore by water depths > 1 m on all sides during an average June. The island may be solid, or it may be a floating vegetation mat that is sufficiently large and dense to support a waterbird nest.	0	[WBN]
F41	Duckweed	At some time of the year, mats of algae and/or duckweed are likely to cover >50% of the AA's otherwise-unshaded water surface, or blanket >50% of the underwater substrate. If true, enter "1" in next column. If untrue or uncertain, enter "0".	0	[EC, PR, WBF]
F42	Channel Connection & Outflow Duration	The most persistent surface water connection (outlet channel or pipe, ditch, or overbank water exchange) between the AA and a downslope stream network is: [Note: If the AA represents only part of a welland, answer this according to whichever is the least permanent surface connection: the one between the AA and the rest of the wetland, or the surface connection between the wetland and the downslope stream network.] Persistent (surface water flows out for >9 months/year).	0	Consider the connection regardless of whether the surface water is frozen. The "downslope stream network" could consist of ditches, rivers, ponds, or lakes which eventually connect to the ocean. If this cannot be determined while visiting the AA, consult topographic maps perhaps by viewing these online with Toporama (http://atlas.nrcan.gc.ca/toporama/en/index.html) [CS, FA, FR, NR, OE, PR, Sens, SFS SR, WCv, WS]
		Seasonal (surface water flows out for 14 days to 9 months/year, not necessarily consecutive).	1	
		Temporary (surface water flows out for <14 days, not necessarily consecutive). None but maps show a stream network downslope from the AA and within a distance that is less than the AA's length. SKIP to F47 (pH	0	
		Measurement).		
		No surface water flows out of the wetland except possibly during extreme events (-once per 10 years). Or, water flows only into a wetland, ditch, or lake that lacks an outlet. SKIP to F47 (pH Measurement).	0	
F43	Outflow Confinement	During major runoff events, in the places where surface water exits the AA or connected waters nearby, the water:		"Major runoff events" would include biennial high water caused by storms and/or rapid snowmelt. [CS, NR, OE, PR, Sens, SR, STR, WS]
		Mostly passes through a pipe, culvert, narrowly breached dike, berm, beaver dam, or other partial obstruction (other than natural topography) that does not appear to drain the wetland artificially during most of the growing season.	0	
		Leaves through natural exits (channels or diffuse outflow), not mainly through artificial or temporary features.	1	
		Is exported more quickly than usual due to ditches or pipes within the AA or connected to its outlet, or within 10 m of the AA's edge, which drain the wetland artificially, or water is pumped out of the AA.	0	
F44	Tributary Channel	At least once annually, surface water from a tributary channel that is >100 m long moves into the AA. Or, surface water from a larger permanent water body adjacent to the AA spills into the AA. If it enters only via a pipe, that pipe must be fed by a mapped stream or lake further upslope. If no, SKIP to F47 (pH Measurement).	0	If inlet tributaries cannot be searched for due to inaccessibility of part of the AA, follow suggestions in F42 above. [NRv, PH, PRv, SRv]
F45	Input Water Temperature	Based on lack of shade, water source characteristics, or actual temperature measurements, the inflow is likely to be warmer than surface water in the AA during part of most years. Enter 1= yes, 0= no.	0	[WCv]
F46	Throughflow	During its travel through the AA at the time of peak annual flow, water arriving in channels: [select only the ONE encountered by most of the incoming water].		[FA, FR, INV, NR, OE, PR, SR, WS]
	Resistance	Does not bump into many plant stems as it travels through the AA. Nearly all the water continues to travel in unvegetated (often incised) channels that have minimal contact with wetland vegetation, or through a zone of open water such as an instream pond or lake.	0	
		Bumps into herbaceous vegetation but mostly remains in fairly straight channels. Bumps into herbaceous vegetation and mostly spreads throughout, or is in widely meandering, multi-branched, or braided channels.	0	
		Bumps into tree trunks and/or shrub stems but mostly remains in fairly straight channels. Bumps into tree trunks and/or shrub stems and follows a fairly indirect path from entrance to exit (meandering, multi-branched, or braided).	0	
F47	pH Measurement	The pH in most of the AA's surface water:		Preferably, measure this in larger areas of ponded surface water within the AA, or in streams that have
		Was measured, and is: [enter the reading in the column to the right.]	0	passed through (not along) most of the AA. Unless surface water is completely absent, do not dig holes or make depressions in peat in order to provide water for this measurement. Avoid measuring near
		Was not measured but surface water is present and is darkly tea-coloured. Or if no surface water, then mosses and plants that indicate pealland (e.g., Labrador tea) are prevalent. Enter *11. Neither of above. Enter *11.	0	roads or in puddles formed only by recent rain. [AM, FA, FR, NR, WBF, PH, PR, Sens, WBF, WBN]
F48	TDS and/or	The TDS (total dissolved solids) or conductivity off the AA's surface water is: (select the first true row with information):		See above for measurement guidance. [FR, INV, NRv, PH, PRv, Sens]
	Conductivity	TDS is: [Enter the reading in ppm or mg/L in the column to the right, if measured, or answer next row.]		
		Conductivity is [Enter the reading in µS/cm in the column to the right.] Was not measured, but plants that indicate saline conditions cover much of the vegetated AA. Enter *1*.	0	
		Neither of above	1	
F49	Beaver Probability	Use of the AA by beaver during the past 5 years is (select most applicable ONE):		[FA, FR, PH, SBM, Sens, WBF, WBN]
		Evident from direct observation or presence of gnawed limbs, dams, tracks, dens, lodges, or extensive stands of water-killed trees (snags).	0	
		Likely based on known occurrence in the region and proximity to suitable habitat, which may include: (a) a persistent freshwater wetland, pond, or lake, or a perennial low or mid-gradient (<10%) channel, and (b) a corridor or multiple stands of hardwood trees and shrubs in vegetated areas near surface water.	0	
F50	Groundwater Strength	Unlikely because site characteristics above are deficient, and/or this is a settled area or other area where beaver are routinely removed. Select first applicable choice:	1	Adhere to these criteria strictly do not use personal judgment based on fen conditions, pH, or other
1 30	of Evidence	Series in st. applicable choice: Springs are known to be present within the AA, or if groundwater levels have been monitored, that has demonstrated that groundwater primarily discharges to the wetland for longer periods during the year than periods when the wetland recharges the groundwater.	0	Audited to these chiefla shirtly - out hot use personal puginent based of her continuors, pr., or other evidence. Consult lopographic maps to detect breaks in slope described here. Rust deposits associated with groundwater seeps may be most noticeable as orange discoloration in ice formations along streams during early winter. [AM, CS, FA, FR, INV, NR, OE, PH, PRv, SFS, WC, WS]
		Most of the AA has a slope of >5%, or is very close to the base of a natural slope longer than 100 and much steeper than the slope of the AA, AND the pH of surface water, if known, is >5.5.	0	
F51	Internal Gradient	Neither of above is true, although some groundwater may discharge to or flow through the AA. Or groundwater influx is unknown. The gradient along most of the flow path within the AA is:	1	This is not the same as the shoreline slope. It is the elevational difference between the AA's inlet and
	cma Gradietti	The gradient along most of the new part within the AA is. The AA has no surface water outlet (not even seasonally).	1	outlet, divided by the flow-distance between them and converted to percent. If available, use a
		2-5%.	0	clinometer to measure this. Free clinometer apps can be downloaded to smartphones. If the wetland is large (longer than –1 km), this may be estimated using Google Earth to determine the minimum and
		6-10%. >10%.	0	maximum elevation within the AA, then dividing by length and multiplying by 100. [CS, NR, OE, PR, SR, WBF, WBN, WS]
		ions: If the AA lacks an upland edge, evaluate based on the AA's entire perimeter, and moving outward into whatever areas are		
adjace F52		nese questions are best answered by measuring from aerial images. Within a zone extending 30 m laterally from the AA's edge with upland and/or other wetlands, the percentage that contains perennial		[AM, FA, FR, INV, NRv, PH, POL, PRv, SBM, Sens, SRv, STR, WBN]
	of Perimeter	vegetation cover (except lawns, row crops, heavily grazed land, conifer plantations) is:		
		<5%. 5 to 30%.	0	
		30 to 60%.	0	
		60 to 90%. >90%, or all the area within 30 m of the AA edge is other wetlands. SKIP to F55.	0	
		> 70.70, or all the area within 30 m of the AM edge is offiel Welldhus. 3Nit to F33.		

FieldF form - Non-tidal Page 4 of 5

53	Type of Cover in Buffer	Within 30 m upslope of where the wetland transitions to upland, the upland land cover that is NOT perennial vegetation is mostly (mark ONE):		[AM, FA, INV, NRv, PH, POL, SBM, STR, WBN]
	Type or devel in Buner			
		Impervious surface, e.g., paved road, parking lot, building, exposed rock.	0	
		Bare or nearly bare pervious surface or managed vegetation, e.g., lawn, row crops, unpaved road, dike, landslide.	0	
54	Buffer Slope	The steepest and/or most disturbed part of the upland area that is within 30 m of the wetland and occupies >10% of that upland area has a percent slope of:		[NRv, PRv, Sens, SRv]
		<1% (flat almost no noticeable slope) or all the area within 30 m of the AA edge is other wetlands.	0	
		2-5%.	0	
		5-30%. >30%.	0	4
55	Cliffs or Steep Banks	>30%. In the AA or within 100 m, there are elevated terrestrial features such as cliffs, talus slopes, stream banks, or excavated pits (but not riprap)	0	Do not include upturned trees as potential den sites. [POL, SBM]
33	Cilis of Steep Baliks	In the zero of within 1 on, interest are expensed terrestation realized such as callos, made subjects, sureain contrast, or exceptive pins Qualifornity inputs that extend at least 2 m nearly vertically, are unvegetated, and potentially contain crevices or other substrate suitable for nesting or den areas. Enter 1 (yes) or 0 (no).	0	DO NOI INCIDURE UPERS AS POTENTIAL DEL SILES. [F.O.L., DUM]
56	New or Expanded Wetland	Human actions within or adjacent to the AA have persistently expanded a naturally occurring wetland or created a wetland where there previously was none (e.g., by excavation, impoundment):		Determine this using historical aerial photography, old maps, soil maps, or permit files as available [C NR, OE, PH, Sens]
		No.	1	
		Yes, and created or expanded 20 - 100 years ago.	0	
		Yes, and created or expanded 3-20 years ago.		4
		Yes, and created or expanded within last 3 years.	0	-
		Yes, but time of origin or expansion unknown. Unknown if new or expanded within 20 years or not.	0	-
57	Burn History	More than 1% of the AA's previously vegetated area:	0	Look for charred soil or stumps (in multiple widely-spaced locations) or ask landowner. [CS, PH, STR]
	Durit History			2 South of Statings (in manages makey Spacea totalions) of ask tandomici. [63, FH, STK
		Burned within past 5 years.	0	4
		Burned 6-10 years ago.	0	4
		Burned 11-30 years ago.	0	
		Burned >30 years ago, or no evidence of a burn and no data.	1	(DLI CTD WOF)
58	Visibility	The maximum percentage of the welland that is visible from the best vantage point on public roads, public parking lots, public buildings, or public maintained trails that intersect, adjoin, or are within 100 m of the AA (select one) is:		[PU, STR, WBFv]
		<25%.		
		25·50%. >50%.	0	4
59	Non-consumptive	Assuming access permission was granted, select ALL statements that are true of the AA as it currently exists:	Ü	[PU, STR]
J7	Uses - Actual or			[10, 310]
	Potential	For an average person, walking is physically possible <u>in</u> (not just near) >5% of the AA during most of the growing season, e.g., free of deep water and dense shrub thickets.	1	
		Maintained roads, parking areas, or foot-traits are within 10 m of the AA, or the AA can be accessed part of the year by boats arriving via contiquous waters.	0	
		Within or near the AA, there is an interpretive center, trails with interpretive signs or brochures, and/or regular guided interpretive tours.	0	
60	Unvisited Core Area	The percentage of the AA almost never visited by humans during an average growing season probably comprises: [Note: Only include the part actually walked or driven (find simply viewed from) with a vehicle or boat. Do not include visitors on traits outside of the AA unless more than half the welfand is visible from the traits and they are within 30 nor of the welfand edge. In that case include only the accupied by the		[AM, FAv, FRv, PH, PU, SBM, STR, WBF, WBN]
		trail.]		
		<5% and no inhabited building is within 100 m of the AA.	0	
		<5% and inhabited building is within 100 m of the AA.	0	
		5-50% and no inhabited building is within 100 m of the AA.	0	
		5-50% and inhabited building is within 100 m of the AA.	0	
		50-95%, with or without inhabited building nearby.	0	
61	Fraguently Violted	>95% of the AA with or without inhabited building nearby.		TAMA DILI DILI COMI CTD. MIDE MIDAN
01	Frequently Visited Area	The part of the AA visited by humans almost daily for several weeks during an average growing season probably comprises: [See note above.]		[AM, PH, PU, SBM, STR, WBF, WBN]
		<5%. If F60 was answered ">95%" (mostly never visited), SKIP to F64.	1	
		5-50%.	0	4
		50-95%.	0	4
	DIAD O II	>95% of the AA.	0	(DLL DLE
	BMP - Soils	Boardwalks, paved trails, fences or other infrastructure and/or well-enforced regulations appear to effectively prevent visitors from walking on soil within nearly all of the AA when the soil is unfrozen. Enter "1" if true.	0	[PH, PU]
63	BMP - Wildlife Protection	Fences, observation blinds, platforms, pawed trails, exclusion periods, and/or well-enforced prohibitions on motorised boats, off-leash pets, and off froad welnickes appear to effectively exclude or divert visitors and their pets from the AA at critical times in order to minimize disturbance of wildlife (except during hunting seasons). Enter "1" if true.	0	[AM, PU, WBF, WBN]
64	Consumptive Uses	Recent evidence was found within the AA of the following potentially-sustainable consumptive uses. Select ALL that apply.		[FAv, FRv, WBFv]
	(Provisioning Services)	Low-impact commercial timber harvest (e.g., selective thinning).	0	1
		Commercial or traditional-use harvesting of native plants, their fruits, or mushrooms.	0	1
		Waterfowl hunting.	0	1
		Fishing.	0	1
		Trapping of furbearers.	0	1
		None of the above.	1	
65	Domestic Wells	The closest wells or water bodies that currently provide drinking water are:		[NRv]
		Within 0-100 m. of the AA.	0	
		100-500 m. away.	0	1
		>500 m. away, or no information.	1	1
66	Calcareous Fen	The AA is, or is part of, a calcareous fen. See the Plants_Calcar worksheet in the accompanying Supplnfo file for list of plant indicators	0	[PH, PR]
		(calciphiles). Enter 1 If more than two Strong or more than five Moderate calciphile species are present; otherwise enter 0, but if not able to		T · ·

AQUATIC HABITAT Group (max+avg/2 of FA, FR, AM, WBF, WBN)	1.82	Lower	2.02	Lower	2.94	2.48
TRANSITION HABITAT Group (max+avg/2 of SBM, PH, POL)	8.70	Higher	7.37	Higher	7.08	6.69
WETLAND CONDITION (EC)			7.83	Higher		8.75
WETLAND RISK (average of Sensitivity & Stressors)			0.36	Lower		2.35
	NOTE: A coor	o of 0 door not	moon the fund	tion or honofit i	a abaant from t	ho watland It

NOTE: A score of 0 does not mean the function or benefit is absent from the wetland. It means only that this wetland has a capacity that is equal or less than the lowest-scoring one, for that function or benefit, from among the 98 NB calibration wetlands that were assessed previously.

Cover Page: Basic Description of Assessment	WESP-AC version 2
Site Name:	Burchill Wind Energy Project - PLE-W-07
Investigator Name:	Derrick Mitchell
Date of Field Assessment:	7 August 2020
Nearest Town:	Lorneville (west Saint John), New Brunswick
Latitude (decimal degrees):	45.172878
Longitude (decimal degrees):	-66.203534
ls a map based on a formal on-site wetland delineation available?	Yes
Approximate size of the Assessment Area (AA, in hectares):	0.69
AA as percent of entire wetland (approx.). Attach sketch map if AA is smaller than the entire contiguous wetland.	
What percent (approx.) of the wetland were you able to visit?	100
What percent (approx.) of the AA were you able to visit?	100
Were you able to ask the site owner/manager about any of the questions?	No
Indicate here if you intentionally surveyed for rare plants, calciphile plants, or rare animals	Yes
Have you attended a WESP-AC training session? If so, indicate approximate month & year	Yes, September 2016
How many wetlands have you assessed previously using WESP-AC? (approx.)	100+
Comments about the site or this WESP-AC assessment (attach extra page if desired):	

Form OF (Office). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Conduct an assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answering many of the questions below will require using these online map viewers:

Google Earth Pro: https://www.google.com/earth/download/gep/agree.html

GeoNB: http://www.snb.ca/geonb1/ and http://www.snb.ca/geonb1/e/apps/apps-E.asp

Geons: http://www.sno.ca/geonol/ and http://www.sno.ca/geonol/e-appsy-appsy-casps
For most wetlands, completing this office data form will require 1-2 hours. For a list of functions to which each question pertains, see bracketed abbreviations in the Definitions/Explanations column. For detailed descriptions of each WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, PO= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity, STR= Stressors.

)F1	Indicators	Condition Choices	Data	Definitions/Explanations
	Province	Mark the province in which the AA is located by changing the 0 in the column next to it to a *1". Mark only one.		This determines to which province's calibration wetlands the raw score of any wetland is normalise
		New Brunswick	1	In the function and benefits models, it also triggers the automatic exclusion of indicators for which spatial data exists in a particular province.
		Nova Scotia	0	Spanial add Onsis in a particular province.
		Prince Edward Island	0	
		Newfoundland-Labrador	0	
2	Ponded Area Within 1 km.	The area of surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) within 1 km is:		"Adjacent" means not separated from the AA by a wide expanse (>50 m) of upland (including roa >50 m wide). Include ponded areas likely to be hidden by wetland vegetation. If surface water
		<0.01 hectare (about 10 m x 10 m).	0	extends beyond 1 km, include only the part within 1 km. Do not include tidal areas. Measure the
		0.01 - 0.1 hectare.	0	from aerial imagery using Google Earth Pro (click on Ruler icon in toolbar, then Polygon in pop-up- menu). With the GeoNB viewer, enable the Wetlands layer, then measure with the Draw & Meas
		0.1 - 1 hectare.	0	tool after specifying Aerial as the Basemap. However, do not rely entirely on wetland boundaries
		1 to 10 hectares.	1	shown in online wetlands layers. [PH, SBM, WBN]
		10 to 100 hectares.	0	
		>100 hectares.	0	
3	Ponded Water & Wetland Within 1 km.	The area of wetlands and surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) within 1 km is:	n	See definition of adjacent in OF2. If the AA's wetland vegetation extends beyond 1 km, include o the part within 1 km. "Ponded" means not flowing in rivers or streams. [Sens, WBF]
		<0.01 hectare (about 10 m x 10 m).	0	
		0.01 - 0.1 hectare.	0	
		0.1 - 1 hectare.	0	
		1 to 10 hectares.	1	
		10 to 100 hectares.	0	
		>100 hectares.	0	
4	Size of Largest Nearby Vegetated Tract or	The largest vegetated patch or corridor that includes the AA's vegetation plus albdjacent upland vegetation that is not lawn, row crops, heavily grazed lands, conifer plantation is:		See definition of adjacent in OF2. Use Google Earth Pro's polygon ruler (as described above). Exclude conifer plantations only if it is obvious that trees were planted in rows. [AM, PH, SBM, Se
	Corridor	<0.01 hectare (about 10 m x 10 m).	0	
		0.01 - 0.1 hectare.	0	
		0.1 - 1 hectare.	0	
		1 to 10 hectares.	0	
		10 to 100 hectares.	0	
		100 to 1000 hectares.	0	
		>1000 hectares. [This is nearly always the answer in relatively undeveloped landscapes]	1	
5	Distance to Large Vegetated Tract	The minimum distance from theedge of the AA to the edge of the closest vegetated land (but excluding row crops, lawn, conifer plantation) larger than 375 hectares (about 2 km on a side), is:		To measure distance, use Google Earth Pro (Ruler > Line tool). Or use Draw & Measure tool at GeoNB. The 375-ha criterion is from the Fundy Model Forest Project. [AM, PH, POL, SBM, Sens
		-50 m, and not separated from the 375-ha vegetated area by any width opaved roads, stretches of open water, row crops, bare ground, lawn, or impervious surface. Or the AA itself contains >375 ha of vegetation. [This is often the answer in relatively undeveloped landscape.]	1 s.]	
		<50 m, but completely separated from the 375-ha vegetated area by those features, and AA does not contain >375 ha of vegetation.	0	
		50-500 m, and not separated.	0	
		50-500 m, but separated by those features.	0	
		0.5 - 5 km, and not separated.	0	
		0.5 - 5 km, but separated by those features.	0	
		None of the above (the closest patches or corridors which are that large are >5 km away).	0	
6	Herbaceous Uniqueness	The AA's vegetation cover is >10% herbaceous* but uplands within 5 km have <10% herbaceous cover. If so, enter "3" and continue to OF7. If not, consider: The AA's vegetation cover is >10% herbaceous* but uplands within 1 km have <10% herbaceous cover. If so enter "2" and continue to OF7. If not, consider: The AA's vegetation cover is >10% herbaceous* but uplands within 100 m of the wetland edge have <10% herbaceous cover. If so, enter "1". "NOTE: Exclude lawns, row crops, heavily grazed lands, forest, shrublands. Include moss as well as grasslike plants in this use of "herbaceous vegetation"]	1	For this question only, consider moss to be herbaceous vegetation. Determine the score by view areal imagery in Google Earth After successively drawing or estilianting the boundaries of the but of 5 km, 1 km, and 100 m radius focused on the center of the AA. Circles of specified radius can drawn in Google Earth Pro by clicking on the Ruler icon, then Circle in the pop-up menu. [AMN, F POLV, SBMV, WBFV, WBNV]
7	Woody Uniqueness	The AA's vegetation cover is >10% woody" but uplands within 5 km have <10% woody cover. If so, enter "3" and continue to OF8. If not,	2	See above. Do not consider conifer plantations to be forest if it is obvious that trees were planted
		consider: The AA's vegetation is >10% woody" but uplands within 1 km have <10% woody cover. If so enter "2" and continue to OF8. If not, consider:		rows. [AMv, PHv, POLv, SBMv]
		The ARS vegetation is >10% woody* but uplands within 100 m of the wetland edge have <10% woody cover. If so, enter "1" [" NOTE: woody cover = trees & shrubs taller than 1 m.]		
8	Local Vegetated Cover Percentage	Draw a 5-km radius circle measured from the center of the AA. Ignoring all permanent water in the circle, the percent of the remaining are that is wooded or unmanaged herbaceous vegetation (NOT lawn, row crops, bare or heavily grazed land, clearcuts, or conifer plantations) is:		In Google Earth, draw the 5 km buffer and then estimate land cover percentages, or do GIS analy of an appropriate land cover layer. [AM, PH, POL, SBM, Sens]

In Google Earth, click on the Ruter icon, then Path, and draw and measure the route. Or use the GeoNB's Draw & Measure tool> Freehand Line of draw and measure the rout Settlements (click on Place Names in menu) or other areas not close to mapped settlements but

OF11	Distance to Nearest Maintained Road	From the center of the AA, the distance to the nearest maintained public road (dirt or paved) is:		Determine this by viewing aerial imagery in Google Earth and measuring with the Ruler>Line tool. use the GeoNB's Draw Line tool. [AM, FAv, FRv, NRv, PH, PU, SBM, STR, WBN]
	ividii italii eu Rodu	<10 m.	0	use the Geord's Diaw Line tool. [AW, FAV, FRV, NRV, FR, FU, SDW, STR, WDN]
		10 - 25 m.	0	
		25 - 50 m.	0	
		50 - 100 m. 100 - 500 m.	0	
		>500 m.	0	
OF12	Wildlife Access	Draw a circle of radius of 5 km from the center of the AA. If mammals and amphibians can move from the center of the AA to ALL other separate wetlands and ponds located within the circle without being forced to cross pavement (any width), lawns, bare ground, and/or marine waters, mark 1 = yes can move to all, 0 = no. Change toblank if there are no other wetlands within 5 km.	0	In NB, enable the Wellands layer in GeoNB (despite its omissions) to show surrounding wetlands roads, while estimating the location of the 5 km circle (or draw the 5 km circle in Google Earth Pro using the Circle tool and compare). Evaluate using Google Earth, being cautious to search for roac hidden under forest canopy. (AM, SBM, STR)
OF13	Distance to Ponded	The distance from the AA center to the closest (but separate) ponded water body visible in GoogleEarth imagery is:		In Google Earth, zoom in closely to examine the surrounding landscape for ponds, lakes, and
	Water	<50 m, and not separated by any width of paved roads, stretches of open water, row crops, lawn, bare ground, or impervious surface.	0	wetlands that appear to be permanently flooded. Enable the GeoNB viewer's Wetlands layer as w [AM, PH, SBM, Sens, WBF, WBN]
		<50 m, but completely separated by those features. 50-500 m, and not separated.	0	
		50-500 m, and not separated. 50-500 m, but separated by those features.	0	1
		0.5 - 1 km, and not separated.	0	1
		0.5 - 1 km, but separated by those features.	- 1	
		None of the above (the closest patches or corridors that large are >1 km away).	0	
OF14	Distance to Large Ponded Water	The distance from the AA center to the closest (tull separate)non-lidal body of water that is ponded during most of the year and islarger than 8 hectares during most of a normal year is: 100 m.	0	Determine this by viewing aerial imagery in Google Earth. [Sens, WBF, WBN]
		100 m - 1 km.	0	1
		1 -2 km.	0	1
		2-5 km.	1	
		5-10 km.	0	
0545	Tidal Provincit	>10 km.	0	In Coords Forth, moreure the distance to the coord floatistic P. (5, 1) and the
UF I5	Tidal Proximity	The distance from the AA edge to the closesttidal water body (regardless of its salinity) is:		In Google Earth, measure the distance to the ocean (including Bay of Fundy) or tidal river, whicheve is closer. If you need to see how far upriver a river is tidal, see the KMZ file provided with this
		<100 m.	0	calculator for NB (NB Headtide). Points shown in those files are only an approximation, so local
		100 m - 1 km. 1 - 5 km.	0	information if available may be preferable. [FA, WBF]
		1 - 5 KM. 5-10 km.	0	4
		10-40 km.	0	
		>40 km.	0	1
OF16	Upland Edge Contact	Select one:		[NR, SBM, Sens]
		The AA has no upland edge (or upland is <1% of perimeter). The AA is entirely surrounded by (& contiguous with) other wetlands or water	. 0	
		1-25% of the AA's perimeter abuts upland (including filled areas). The rest adjoins other wetlands or water that is mostly wider than the AA	0	
		25-50% of the AA's perimeter abuts upland. The rest adjoins other wetlands or water that is mostly wider than the AA. 50-75% of the AA's perimeter abuts upland. The rest adjoins other wetlands or water that is mostly wider than the AA.	0	1
		More than 75% of the AA's perimeter abuts upland. Any remainder adjoins other wetlands or water that is mostly wider than the AA.This	1	
		will be true for most assessments done with WESP-AC.		
OF17	Flood Damage from Non- tidal Waters	Within 5 km downstream or downslope of the AA (select first true choice):		In the GeoNB map viewer: click on "More" in upper right, then "Flood Information". Expand the me under it by clicking on the arrow to its left and the slider to its right. Uncheck the first (Limits of Dat
	tidai waters	Maps show Flood Zone or Flood Risk areas and there appears to be infrastructure vulnerable to river flooding not caused by tidal storm surges.	0	order it by clicking of the arrow to its left and the slider to its right. Ordereck the first (Limits of Data box. Where available, LIDAR imagery can provide finer elevational resolution useful for flood modeling. [WSv]
		Maps show Flood Zone or Flood Risk areas, but infrastructure is absent or is not vulnerable to floods from a non-tidal river. In some case: levees, upriver dams, or other measures may partly limit damage or risk from smaller events. Maps do not show Flood Zone or Flood Risk areas or no such mapping has been done locally), and there appears to be infrastructure	0	
		vulnerable to river flooding unrelated to tidal storm surges. Maps do not show Flood Zone or Flood Risk areas (or no such mapping has been done locally) and there isno infrastructure vulnerable to river flooding unrelated to tidal storm surges.	1	
OF18	Relative Elevation in Watershed	In Google Earth, enable the Terrain layer (lower left menu) and open the NB_Watersheds KMZ file that accompanies this calculator. Then determine the AA's approximate elevation (bottom right, NOT the "eye alt"). Then move cursor around to determine the watershed's maximum and minimum elevation. Divide the AA's elevation by the (max-min).	0.20	[FA, NR, Sens, SFSv, WCv, WSv]
OF19	Water Quality Sensitive Watershed or Area	In Google Earth, open the KMZ file NB_Watershed Protected Area which accompanies this calculator. The AA is within such an area. Enter 1= yes, 0= no.	0	If an ACCDC report is available for this AA, it also may contain such information. [NRv]
OF20	Degraded Water Upstream	Sampling indicates a problem with concentrations ofmetals, hydrocarbons, nutrients, or other substances (excluding bacteria, acidic water, high temperatures) being present at levels harmful to aquatic life or humans, and:		May use existing data, or sample those waters as part of this wetland assessment. "Harmful" shou be evaluated with regard to current federal or provincial water quality standards. [AM, FA, FR, NR)
		The condition is present within the AA.	0	PRv, SRv, STR, WBF, WBN]
		The condition is present in waters within 1 km that flowinto the AA, but has not been documented in the AA itself.	0]
		Sampling during both low water periods and times with high runoff (storms, snowmelt) indicates no problems in either the AA or inflowing	0	
		waters. Data are insufficient (no or inadequate sampling within 1 km, or condition exists only at >1 km upstream)This is the situation for nearly	1	
		all wetlands in this region.		
UF21	Degraded Water Downstream	The problem described above is downslope from the AA, and:		May use existing data, or monitor waters as part of this wetland assessment. [NRv, PRv, SRv]
	Downstream	The condition is present within 1 km downslope and connected to the AA by a channel.	0	
		The condition is present within 5 km downslope and connected to the AA by a channel, or within 1 km but not connected to the AA by a channel.	0	
		Sampling during both low water periods and times with high runoff (storms, snowmelt) indicates no problems in either the AA or inflowing waters.	0	
		Data are insufficient (no or inadequate sampling within 1 km, or condition exists only at >1 km upstream)This is the situation for nearly all wetlands in this region.	1	
0.55				Topographic maps may be viewed online at the National Atlas of Canada (Toporama):
OF22	Wetland as a % of its Contributing Area (Catchment)	From a topographic map and field observations, estimate the approximate boundaries of the catchment (CA) of the entire wetland of which the AA may be only a part. Then adjust those boundaries if necessary based on your field observations of the surrounding terrain, and/or it using procedures described in the Manual. Divide the area of the wetland (not just the AA) by the approximate area of its actionment excluding the area of the wetland itself. When doing the calculation, if ponded water is adjacent to the wetland, include that in the wetland area. The result is:) ':	http://atlas.gc.ca/toporama/en/index.html [NR, PR, Sens, SR, WS]
OF22	Contributing Area	the AA may be only a part. Then adjust those boundaries if necessary based on your field observations of the surrounding terrain, and/or tusing procedures described in the Manual. Divide the area of the wetland (not just the AA) by the approximate area of its catchment excluding the area of the wetland itself. When doing the calculation, if ponded water is adjacent to the wetland, include that in the wetland area. The result is: 4.0.01, or catchment size unknown due to stormwater pipes that collect water from an indeterminate area.	0	
OF22	Contributing Area	the AA may be only a part. Then adjust those boundaries if necessary based on your field observations of the surrounding terrain, and/or using procedures describled in the Mahaural. Divide the area of the wetland (not just the AA) by the approximate area of its catchment excluding the area of the wetland itself. When doing the calculation, if ponded water is adjacent to the wetland, include that in the wetland area. The result is: -0.01, or calculationed size unknown due to stormwater pipes that collect water from an indeterminate area. 0.01 to 0.1.) ':	
OF22	Contributing Area	the AA may be only a part. Then adjust hose boundaries if necessary based on your field observations of the surrounding terrain, and/or lusing procedures described in the Manual. Divide the area of the wetland (not just the AA) by the approximate area of its catchment excluding the area of the wetland itself. When doing the calculation, if ponded water is adjacent to the wetland, include that in the wetland area. The result is: -0.01, or catchment size unknown due to stormwater pipes that collect water from an indeterminate area. -0.01 to 0.1. -0.1 to 1. -1 (wetland is larger than its catchment (e.g., wetland with flat surrounding terrain and no inlet, or is entirely isolated by dikes, or is a raise	0	
	Contributing Area (Catchment)	the AA may be only a part. Then adjust those boundaries if necessary based on your field observations of the surrounding terrain, and/or lusting procedures described in the Manual. Divide the area of the wetland (not just the AA) by the approximate area of its catchment excluding the area of the wetland itself. When doing the calculation, if ponded water is adjacent to the wetland, include that in the wetland area. The result is: <0.01, or catchment size unknown due to stormwater pipes that collect water from an indeterminate area. 0.01 to 0.1 0.1 to 1. >1 (wetland is larger than its catchment (e.g., wetland with flat surrounding terrain and no inlet, or is entirely isolated by dikes, or is a raise bog). The proportion of the AA's contributing area (measured to no more than 1000 m upslope) that is comprised of buildings, roads, parking lot	0 0 1	
	Contributing Area (Catchment)	the AA may be only a part. Then adjust hose boundaries if necessary based on your field observations of the surrounding terrain, and/or using procedures described in the Mahaural. Divide the area of the wetland (not just the AA) by the approximate area of its catchment excluding the area of the wetland itself. When doing the calculation, if ponded water is adjacent to the wetland, include that in the wetland area. The result is: -0.01, or catchment size unknown due to stormwater pipes that collect water from an indeterminate area. 0.01 to 0.1. 0.1 to 1. -1 (wetland is larger than its catchment (e.g., wetland with flat surrounding terrain and no inlet, or is entirely isolated by dikes, or is a raise long).	0 0 1	http://ailas.gc.ca/toporama/en/index.html [NR, PR, Sens, SR, WS]
	Contributing Area (Catchment)	the AA may be only a part. Then adjust those boundaries if necessary based on your field observations of the surrounding terrain, and/or lusting procedures described in the Manual. Divide the area of the wetland (not just the AA) by the approximate area of its catchment excluding the area of the wetland itself. When doing the calculation, if ponded water is adjacent to the wetland, include that in the wetland area. The result is: -0.01, or catchment size unknown due to stormwater pipes that collect water from an indeterminate area. 0.01 to 0.1 -1 (wetland is larger than its catchment (e.g., wetland with flat surrounding terrain and no inlet, or is entirely isolated by dikes, or is a raise too). The proportion of the AA's contributing area (measured to no more than 1000 m upslope) that is comprised of buildings, roads, parking lot other pavement, exposed bedrock, landslides, and other mostly-bare surface is about:	0 0 1	http://ailas.gc.ca/toporama/en/index.html [NR, PR, Sens, SR, WS]

OF24	Transport From Upslope	A relatively large proportion of the precipitation that falls farther upslope in the CA reaches this wetland quickly as runoff (surface water), a	9	[NRv, PRv, SRv, WSv]
		indicated by the following:		
		(a) input channel is present,		
		(b) input channels have been straightened, (c) upslope wetlands have been ditched extensively,		
		(d) land cover is mostly non-forest,		
		(e) CA slopes are steep, and/or		
		(f) most CA soils are shallow (bedrock near surface) and/or have high runoff coefficients.		
		This statement is:		
		Mostly true.	0	
		Somewhat true.	0	1
		Mostly untrue.	1	
OF25	Aspect	The overland flow direction of most surface water (in streams, rivers, or runoff) that enters the AA is:		[AM, NR, SFS, WC, WS]
01 23	парсы			[AIII, III., 31.3, II.0, II.3]
		Northward (N, NE). north-facing contributing area.	0	
		Southward (S, SW). south-facing contributing area.	1	
		Other (E, SE, W, NW), or no detectable uphill slope or input channel (flat).		
OF26	Internal Flow Distance	The horizontal flow distance from the wetland's inlet to outlet is:		Identify inlets and outlets, if any, from topographic maps (use elevations to determine which are inlet
	(Path Length)	10	0	and which are outlets) and augment by field inspection. [NR, OE, PR, SR, WS]
		<10 m.	0	
		10 - 50 m.	0	-

		Ownership is private but public access is allowed, and/or a shorter-term conservation easement (whether renewable or not) is in place.	0	
		Ownership is private and owner does not allow access, or access permission unknown, and not a conservation easement.	0	1

Date: 7 August 2020 Site Identifier: PLE-W-07 Investigator: Derrick Mitch

Form F (Field). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Walk for no less than 10 minutes from the wetland edge towards its core, in the part of the AA that is proposed for alteration. If no alteration is proposed, walk in a portion that appears to be most representative of the wetland overall. Walk only where it is safe and legal to do so. Conduct the assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answer these questions primarily based on your onsite observations and interpretations. Do not write in shaded parts of this data form. Answering some questions accurately may require conferring with the landowner or other knowledgable persons and/or reviewing aerial imagery. For most wetlands, completing this field data form will require 1-2 hours on a site. For a list of functions to which each question pertains, see the accompanying Interpretations form. For detailed descriptions of each WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage & Delay, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity, STR= Stressors.

<i>u</i>	to alt.	Condition of the	D	Definition / C. L. V.
#	Indicators	Condition Choices	Data	Definitions/Explanations
1	Welland Type	Follow the key below and mark the ONE row that best describes MOST of the vegetated part of the AA:		Ericaceous shrubs are ones in the heather family (Ericaceae). Most have leathery evergreen leaves. They include rhododendron, azalea, swampl alurel, leatherlaef, Lador lea, and others. Most require acidic soil. Although not in the family Ericaceae, sweetgale (<i>Mynica gale</i>) should be counted also. [AM, CS, FA, FR, INV, NR, OE, PH, Sens, SFS, WBF, WBN]
		A. Moss and/or lichen cover more than 25% of the ground. Often dominated by ericaceous shrubs (e.g., Labrador lea) or other acid-tolerant plants (e.g., bog cranberry, pitcher plant, sundew, orchids). Substrate is mostly undecomposed peat. Choose between A1 and A2 and mark the choice with a 1 in their adjoining column. Otherwise go to B below.		
		A1. Surface water is usually absent or, if present, pH is typically <4.5 and conductivity is usually <100 μS/cm (<64 ppm TDS). Trees are absent or nearly so. Sedge cover usually sparse or absent but cottongrass and/or lichen cover may be extensive, as well as cloudberry, lingonberry, sheep laurel, and a sedge (<i>Carex rariflora</i>). Weltland surface and surrounding landscape are seldom sloping and weltland often is domed (convex). Inlet and outlet channels are usually absent. If known, pH of peat is <4.0.	0	
		A2. Not A1. Surface water, if present, has pH typically >4.5 and conductivity is usually >100 µS/cm (>64 ppm TDS). Sedge cover is usually extensive, and/or tree and fall shrub cover is extensive. Sometimes at toe of slope or edge of water body. An exit channel is usually present. Wetter than A1 and peat depth may be shallower (<2 m).	0	
		B. Moss and/or lichen cover less than 25% of the ground. Soil is mineral or decomposed organic (muck). Choose between B1 and B2 and mark the choice with a 1 in their adjoining column:		
		B1. Trees and shrubs taller than 1 m comprise more than 25% of the vegetated cover. Surface water is mostly absent or inundates the vegetation only seasonally (e.g., vernal pools or floodplain).	1	
		B2. Not B1. Tree & fall shrubs comprise less than than 25% of the vegetated cover. Vegetation is mostly herbaceous, e.g., cattail, bulrush, burreed, pond lily, horselail. Surface water may be extensive and fluctuates seasonally, being either persistent or drying up partly or entirely.	0	
A sh nclud adja	ould also include part of e the open water part ad cent " is used synonymo	the AA should include all persistent waters in ponds smaller than 8 hectares (-283 m on a side) that are adjacent to the AA. The the water area of adjacent ponded water larger than 8 ha and adjacent rivers wider than 20 m. Specifically, the AA should jacent to wetland vegetation and equal in width to the average width of that vegetated zone. Throughout this data form usly with abutting, adjoining, bordering, contiguous and means no upland (manmade or natural) completely separates the directly shared edge. Features joined only by a channel are not necessarily considered to be adjacent a large portion of their		
	must match. The featur	res do not have to be hydrologically connected in order to be considered adjacent.		
2	Wetland Types - Adjoining or Subordinate	If the AA is smaller than 1 ha, mark all other types that occupy more than 1% of the vegetated AA. If the AA is larger than 1 ha, mark all other types which are within or adjacent to the AA and occupy more than 1 ha, as visible from the AA or as interpreted from aerial imagery. Do not mark again the type marked in F1.		1 hectare is 10,000 sq. m or about 2.5 acres. It could have dimensions of 100 m by 100 m, 1000 m by 10 m, or similar. [AM, INV, SBM, WBF]
		A1. A2.	0	
		B1.	0	
		B2.	0	
3	Woody Height & Form Diversity	Following EACH row below, indicate with a number code the percentage of the living vegetation in the AA which is occupied by that feature (6 if >95%, 5 if 75-95%, 4 if 50-75%, 3 if 25-50%, 2 if 5-25%, 1 if <5%, 0 if none). If the vegetated part of the AA is largely herbaceous (non-woody) vegetation, these percentages should not sum to 100%.		Deciduous shrubs in this region usually include buttonbush, Labrador tea, bayberry (Morella*), huckleberry, cranberry, cloudberry, sweetgale, alder, willow, birch, ash, dogwood, and a few others. If you assigned a code of 3 or higher to any of the first four choices and the ground cover beneath the trees/shrubs is <25% moss; then question F1 might be "B1". [CS, INV, NR, PH, POL, SBM, Sens]
		coniferous trees (may include tamarack) taller than 3 m. deciduous trees taller than 3 m.	5	
		coniferous or ericaceous shrubs or trees 1-3 m tall not directly below the canopy of trees.	1	
		deciduous shrubs or trees 1-3 m tall not directly below the canopy of trees.	0	
		coniferous or ericaceous shrubs <1 m tall not directly below the canopy of taller vegetation. deciduous shrubs or trees <1 m tall (e.g., deciduous seedlings) not directly below the canopy of taller vegetation.	0	
l <u>ote</u> :	If none of top 4 rows in	F3 was marked 2 or greater , SKIP to F9 (N fixers).		
4	Dominance of Most Abundant Shrub Species	Determine which two woody plant species comprise the greatest portion of the low (<3 m) woody cover . Then choose one:		[PH, POL, SBM, Sens]
		those species together comprise > 50% of such cover.	1	
5	Woody Diameter Classes	those species together do not comprise > 50% of such cover. Mark ALL the types that comprise >5% of the woody canopy cover in the AA or > 5% of the wooded areas (if any) along its upland edge	0	Estimate the diameters at chest height. If small-diameter trees are overtopped (shaded) by larger ones, visualise a "subcanopy" at the average height of the smaller-dbh trees, to serve as a basis for it minimum 5% canopy requirement in this question. The trees and shrubs need not be wetland species [AM, CS, POL, SBM, Sens, WBN]
		(perimeter). The edge should include only the trees whose canopies extend into the AA.	- 1	
		coniferous, 1-9 cm diameter and >1 m tall. broad-leaved deciduous 1-9 cm diameter and >1 m tall.	1	
		coniferous, 10-19 cm diameter.	1	
		broad-leaved deciduous 10-19 cm diameter. coniferous, 20-40 cm diameter.	1

FieldF form - Non-tidal Page 3 of 5

:37	Interspersion of	During most of the part of the growing season when water is present, the spatial pattern of emergent vegetation within the water is mostly:		[AM, FA, FR, INV, NR, OE, PH, PR, SBM, SR, WBF, WBN]
	Emergents & Open Water	Scattered. More than 30% of such vegetation forms small islands or corridors surrounded by water.	0	
	water	Intermediate.	0	
		Clumped. More than 70% of such vegetation is in bands along the wetland perimeter or is clumped at one or a few sides of the surface water area.	0	
	Persistent Deepwater	If the deepest patch of surface water (flowing or ponded) in or directly adjacent to the AA is mostly deeper than 0.5 m for >2 weeks during the	0	
	Area Non-vegetated Aquatic	growing season, enter "1" and continue. If not, enter "0" and SKIP to F42 (Connection). During most of the growing season and in waters deeper than 0.5 m, the cover for fish, aquatic invertebrates, and/or amphibians that is		For this question, consider only the wood that is at or above the water surface. Estimates of underwater
	Cover	provided NOT by living vegetation, but by accumulations of dead wood and undercut banks is:		wood based only on observations from terrestrial viewpoints are unreliable so should not be attempted.
		Little or none. Intermediate.	0	[AM, FA, FR, INV]
		Extensive.	0	
F40	Isolated Island	The AA contains (or is part of) an island or beaver lodge within a lake, pond, or river, and is isolated from the shore by water depths >1 m on all sides during an average June. The island may be solid, or it may be a floating vegetation mat that is sufficiently large and dense to support a waterbird nest.	0	[WBN]
	Duckweed	Al some time of the year, mats of algae and/or duckweed are likely to cover >50% of the AA's otherwise-unshaded water surface, or blanket >50% of the underwater substrate. If true, enter "1" in next column. If untrue or uncertain, enter "0".	0	[EC, PR, WBF]
42	Channel Connection & Outflow Duration	The most persistent surface water connection (outlet channel or pipe, dilch, or overbank water exchange) between the AA and a downslope stream network is; [Note: If the AA represents only part of a wetland, answer this according to whichever is the least permanent surface connection: the one between the AA and the rest of the wetland, or the surface connection between the wetland and the downslope stream network.] Persistent (surface water flows out for >9 months/year).	0	Consider the connection regardless of whether the surface water is frozen. The "downslope stream network" could consist of ditches, rivers, ponds, or lakes which eventually connect to the ocean. If this cannot be determined while visiting the AA, consult topographic maps perhaps by viewing these of this with Toporama (http://atlas.nrcan.gc.ca/toporama/en/index.html) [CS, FA, FR, NR, OE, PR, Sens, SFS SR, WCv, WS]
		Seasonal (surface water flows out for 14 days to 9 months/year, not necessarily consecutive).	1	
		Temporary (surface water flows out for <14 days, not necessarily consecutive). None but maps show a stream network downslope from the AA and within a distance that is less than the AA's length. SKIP to F47 (pH	0	
		Measurement).	0	
		No surface water flows out of the wetland except possibly during extreme events (<once (ph="" 10="" a="" an="" ditch,="" f47="" flows="" into="" lacks="" lake="" measurement).<="" only="" or="" or,="" outlet.="" per="" skip="" td="" that="" to="" water="" wetland,="" years).=""><td>U</td><td></td></once>	U	
-43	Outflow Confinement	During major runoff events, in the places where surface water exits the AA or connected waters nearby, the water:		"Major runoff events" would include biennial high water caused by storms and/or rapid snowmelt. [CS, NR, OE, PR, Sens, SR, STR, WS]
		Mostly passes through a pipe, culvert, narrowly breached dike, berm, beaver dam, or other partial obstruction (other than natural topography) that does not appear to drain the wetland artificially during most of the growing season.	0	
		Leaves through natural exits (channels or diffuse outflow), not mainly through artificial or temporary features. Is exported more quickly than usual due to ditches or pipes within the AA or connected to its outlet, or within 10 m of the AA's edge, which	0	
-44	T-lb. dans Ob annual	drain the welland artificially, or water is pumped out of the AA. At least once annually, surface water from a tributary channel that is >100 m long moves into the AA. Or, surface water from a larger	Ŭ	If inlet tributaries cannot be searched for due to inaccessibility of part of the AA, follow suggestions in
		permanent water body adjacent to the AA spills into the AA. If it enters only via a pipe, that pipe must be fed by a mapped stream or lake further upslope. If no, SKIP to F47 (pH Measurement).	0	F42 above. [NRv, PH, PRv, SRv]
F45	Input Water Temperature	Based on lack of shade, water source characteristics, or actual temperature measurements, the inflow is likely to be warmer than surface water in the AA during part of most years. Enter 1= yes, 0= no.	0	[WCv]
	Throughflow Resistance	During its travel through the AA at the time of peak annual flow, water arriving in channels: [select only the ONE encountered by most of the incoming water].		[FA, FR, INV, NR, OE, PR, SR, WS]
	Resistance	Does not bump into many plant stems as it travels through the AA. Nearly all the water conlinues to travel in unvegetated (often incised) channels that have minimal contact with welland vegetation, or through a zone of open water such as an instream pond or lake.	0	
		Bumps into herbaceous vegetation but mostly remains in fairly straight channels.	0	
		Bumps into herbaceous vegetation and mostly spreads throughout, or is in widely meandering, multi-branched, or braided channels.	0	
		Bumps into tree trunks and/or shrub stems but mostly remains in fairly straight channels.	0	
		Bumps into tree trunks and/or shrub stems and follows a fairty indirect path from entrance to exit (meandering, multi-branched, or braided).	0	
-47	pH Measurement	The pH in most of the AA's surface water:		Preferably, measure this in larger areas of ponded surface water within the AA, or in streams that have
		Was measured, and is: [enter the reading in the column to the right.]		passed through (not along) most of the AA. Unless surface water is completely absent, do not dig holes or make depressions in peat in order to provide water for this measurement. Avoid measuring near
		Was not measured but surface water is present and is darkly tea-coloured. Or if no surface water, then mosses and plants that indicate peatland (e.g., Labrador tea) are prevalent. Enter *1". Neither of above. Enter *1".	0	roads or in puddles formed only by recent rain. [AM, FA, FR, NR, WBF, PH, PR, Sens, WBF, WBN]
	TDS and/or	The TDS (total dissolved solids) or conductivity off the AA's surface water is: (select the first true row with information):		See above for measurement guidance. [FR, INV, NRv, PH, PRv, Sens]
	Conductivity	TDS is: [Enter the reading in ppm or mg/L in the column to the right, if measured, or answer next row.]		
		Conductivity is [Enter the reading in µSkcm in the column to the right.] Was not measured, but plants that indicate saline conditions cover much of the vegetated AA. Enter *1*.	0	
-49	Danier Dankahilik	Neither of above	1	[FA, FR, PH, SBM, Sens, WBF, WBN]
77	Beaver Probability	Use of the AA by beaver during the past 5 years is (select most applicable ONE): Evident from direct observation or presence of gnawed limbs, dams, tracks, dens, lodges, or extensive stands of water-killed trees (snags).	0	[r.v, r.v, som, sells, wor, word]
		Likely based on known occurrence in the region and proximity to sultable habitat, which may include: (a) a persistent freshwater wetland,	0	
		pond, or lake, or a perennial low or mid-gradient (<10%) channel, and (b) a corridor or multiple stands of hardwood trees and shrubs in	U	
		vegetated areas near surface water. Unlikely because site characteristics above are deficient, and/or this is a settled area or other area where beaver are routinely removed.	1	
	Groundwater Strength of Evidence	Select first applicable choice:		Adhere to these criteria strictly do not use personal judgment based on fen conditions, pH, or other evidence. Consult topographic maps to detect breaks in slope described here. Rust deposits
	OF EVIDENCE	Springs are known to be present within the AA, or if groundwater levels have been monitored, that has demonstrated that groundwater	0	associated with groundwater seeps may be most noticeable as orange discoloration in ice formations
		primarily discharges to the wetland for longer periods during the year than periods when the wetland recharges the groundwater.		along streams during early winter. [AM, CS, FA, FR, INV, NR, OE, PH, PRv, SFS, WC, WS]
		Most of the AA has a slope of >5%, or is very close to the base of a natural slope longer than 100 and much steeper than the slope of the AA, AND the pH of surface water, if known, is >5.5.	0	along streams during early winter. [AM, CS, FA, FR, INV, NR, OE, PH, PRv, SFS, WC, WS]
F51	Internal Gradient	Most of the AA has a slope of >5%, or is very close to the base of a natural slope longer than 100 and much steeper than the slope of the AA,	0	This is not the same as the shoreline slope. It is the elevational difference between the AA's inlet and

53	Type of Cover in Buffer	Within 30 m upslope of where the wetland transitions to upland, the upland land cover that is NOT perennial vegetation is mostly (mark ONE):		[AM, FA, INV, NRv, PH, POL, SBM, STR, WBN]
	Type or devel in Bullet			
		Impervious surface, e.g., paved road, parking lot, building, exposed rock.	0	
		Bare or nearly bare pervious surface or managed vegetation, e.g., lawn, row crops, unpaved road, dike, landslide.	0	
54	Buffer Slope	The steepest and/or most disturbed part of the upland area that is within 30 m of the wetland and occupies >10% of that upland area has a percent slope of:		[NRv, PRv, Sens, SRv]
		<1% (flat almost no noticeable slope) or all the area within 30 m of the AA edge is other wetlands.	0	
		2-5%.	0	
		5-30%. >30%.	0	4
55	Cliffs or Steep Banks	>30%. In the AA or within 100 m, there are elevated terrestrial features such as cliffs, talus slopes, stream banks, or excavated pits (but not riprap)	0	Do not include upturned trees as potential den sites. [POL, SBM]
33	Cilis of Steep Baliks	In the zero of within 1 to m, there are executed televation realizes such as callos, and a suppes, surean varies, or exercise pins (our interpretable extend at least 2 m nearly vertically, are unvegetated, and potentially contain crevices or other substrate suitable for nesting or den areas. Enter 1 (yes) or 0 (no).	0	DO NOI INCIDURE UPERS AS POTENTIAL DEL SILES. [F.O.L., DUM]
56	New or Expanded Wetland	Human actions within or adjacent to the AA have persistently expanded a naturally occurring wetland or created a wetland where there previously was none (e.g., by excavation, impoundment):		Determine this using historical aerial photography, old maps, soil maps, or permit files as available [C NR, OE, PH, Sens]
		No.	1	
		Yes, and created or expanded 20 - 100 years ago.	0	
		Yes, and created or expanded 3-20 years ago.		4
		Yes, and created or expanded within last 3 years.	0	-
		Yes, but time of origin or expansion unknown. Unknown if new or expanded within 20 years or not.	0	-
57	Burn History	More than 1% of the AA's previously vegetated area:	0	Look for charred soil or stumps (in multiple widely-spaced locations) or ask landowner. [CS, PH, STR]
	Durit History			2 South of Statings (in manages makey Spacea totalions) of ask tandomici. [63, FH, STK
		Burned within past 5 years.	0	4
		Burned 6-10 years ago.	0	4
		Burned 11-30 years ago.	0	
		Burned >30 years ago, or no evidence of a burn and no data.	1	(DLI CTD WOF)
58	Visibility	The maximum percentage of the welland that is visible from the best vantage point on public roads, public parking lots, public buildings, or public maintained trails that intersect, adjoin, or are within 100 m of the AA (select one) is:		[PU, STR, WBFv]
		<25%.		
		25·50%. >50%.	0	4
59	Non-consumptive	Assuming access permission was granted, select ALL statements that are true of the AA as it currently exists:	Ü	[PU, STR]
J7	Uses - Actual or			[10, 310]
	Potential	For an average person, walking is physically possible <u>in</u> (not just near) >5% of the AA during most of the growing season, e.g., free of deep water and dense shrub thickets.	1	
		Maintained roads, parking areas, or foot-traits are within 10 m of the AA, or the AA can be accessed part of the year by boats arriving via contiquous waters.	0	
		Within or near the AA, there is an interpretive center, trails with interpretive signs or brochures, and/or regular guided interpretive tours.	0	
60	Unvisited Core Area	The percentage of the AA almost never visited by humans during an average growing season probably comprises: [Note: Only include the part actually walked or driven (find simply viewed from) with a vehicle or boat. Do not include visitors on traits outside of the AA unless more than half the welfand is visible from the traits and they are within 30 m of the welfand edge. In that case include only the accupied by the		[AM, FAv, FRv, PH, PU, SBM, STR, WBF, WBN]
		trail.]		
		<5% and no inhabited building is within 100 m of the AA.	0	
		<5% and inhabited building is within 100 m of the AA.	0	
		5-50% and no inhabited building is within 100 m of the AA.	0	
		5-50% and inhabited building is within 100 m of the AA.	0	
		50-95%, with or without inhabited building nearby.	0	
61	Fraguently Violted	>95% of the AA with or without inhabited building nearby.		TAMA DILI DILI COMI CTD. MIDE MIDAN
01	Frequently Visited Area	The part of the AA visited by humans almost daily for several weeks during an average growing season probably comprises: [See note above.]		[AM, PH, PU, SBM, STR, WBF, WBN]
		<5%. If F60 was answered ">95%" (mostly never visited), SKIP to F64.	1	
		5-50%.	0	4
		50-95%.	0	4
	DIAD O II	>95% of the AA.	0	(DLL DLE
	BMP - Soils	Boardwalks, paved trails, fences or other infrastructure and/or well-enforced regulations appear to effectively prevent visitors from walking on soil within nearly all of the AA when the soil is unfrozen. Enter "1" if true.	0	[PH, PU]
63	BMP - Wildlife Protection	Fences, observation blinds, platforms, pawed trails, exclusion periods, and/or well-enforced prohibitions on motorised boats, off-leash pets, and off froad welnickes appear to effectively exclude or divert visitors and their pets from the AA at critical times in order to minimize disturbance of wildlife (except during hunting seasons). Enter "1" if true.	0	[AM, PU, WBF, WBN]
64	Consumptive Uses	Recent evidence was found within the AA of the following potentially-sustainable consumptive uses. Select ALL that apply.		[FAv, FRv, WBFv]
	(Provisioning Services)	Low-impact commercial timber harvest (e.g., selective thinning).	0	1
		Commercial or traditional-use harvesting of native plants, their fruits, or mushrooms.	0	1
		Waterfowl hunting.	0	1
		Fishing.	0	1
		Trapping of furbearers.	0	1
		None of the above.	1	
65	Domestic Wells	The closest wells or water bodies that currently provide drinking water are:		[NRv]
		Within 0-100 m. of the AA.	0	
		100-500 m. away.	0	1
		>500 m. away, or no information.	1	1
66	Calcareous Fen	The AA is, or is part of, a calcareous fen. See the Plants_Calcar worksheet in the accompanying Supplnfo file for list of plant indicators	0	[PH, PR]
		(calciphiles). Enter 1 If more than two Strong or more than five Moderate calciphile species are present; otherwise enter 0, but if not able to		T · ·

FieldS form Non-tidal 2

Assessment Area (AA) Results:

Wetland ID: PLE-W-07

Date: 7 August 2020

Observer: Derrick Mitchell

Latitude & Longitude (decimal degrees): 45.172878, -66.203534

Scores will appear below after data are entered in worksheets OF, F, and S. See Manual for definitions and descriptions of how scores were computed.

computed.						
Wetland Functions or Other Attributes:	Function Score (Normalised)	Function Rating	Benefits Score (Normalised)	Benefits Rating	Function Score (raw)	Benefits Score (raw)
Water Storage & Delay (WS)	2.99	Moderate	0.42	Lower	4.04	0.50
Stream Flow Support (SFS)	2.81	Lower	3.33	Moderate	1.50	1.94
Water Cooling (WC)	0.00	Lower	0.00	Lower	0.00	0.00
Sediment Retention & Stabilisation (SR)	2.69	Moderate	0.53	Lower	5.00	0.32
Phosphorus Retention (PR)	3.68	Moderate	0.17	Lower	5.51	0.49
Nitrate Removal & Retention (NR)	0.91	Lower	1.56	Lower	4.39	2.50
Carbon Sequestration (CS)	8.05	Higher			8.03	
Organic Nutrient Export (OE)	5.97	Higher			5.50	
Anadromous Fish Habitat (FA)	0.00	Lower	0.00	Lower	0.00	0.00
Resident Fish Habitat (FR)	0.00	Lower	0.00	Lower	0.00	0.00
Aquatic Invertebrate Habitat (INV)	5.08	Moderate	0.62	Lower	5.66	1.58
Amphibian & Turtle Habitat (AM)	2.45	Lower	2.90	Moderate	4.60	3.85
Waterbird Feeding Habitat (WBF)	0.00	Lower	0.00	Lower	0.00	0.00
Waterbird Nesting Habitat (WBN)	0.00	Lower	0.00	Lower	0.00	0.00
Songbird, Raptor, & Mammal Habitat (SBM)	5.89	Moderate	6.67	Moderate	4.89	6.67
Pollinator Habitat (POL)	7.92	Higher	6.67	Moderate	6.38	6.67
Native Plant Habitat (PH)	7.09	Higher	6.89	Higher	5.95	5.98
Public Use & Recognition (PU)			2.18	Lower		1.88
Wetland Sensitivity (Sens)			1.55	Lower		2.67
Wetland Ecological Condition (EC)			7.83	Higher		8.75
Wetland Stressors (STR) (higher score means more stress)			1.64	Lower		2.86
Summary Ratings for Grouped Functions:						
HYDROLOGIC Group (WS)	2.81	Moderate	0.42	Lower	4.04	0.50
WATER QUALITY SUPPORT Group (max+avg/2 of SR, PR, NR, CS)	3.05	Lower	1.16	Lower	6.88	1.80
AQUATIC SUPPORT Group (max+avg/2 of SFS, INV, OE, WC)	4.72	Moderate	2.33	Moderate	4.41	1.56
AQUATIC HABITAT Group (max+avg/2 of FA, FR, AM, WBF, WBN)	1.47	Lower	1.74	Lower	2.76	2.31
TRANSITION HABITAT Group (max+avg/2 of SBM, PH, POL)	7.44	Moderate	6.81	Higher	6.06	6.55
WETLAND CONDITION (EC)			7.83	Higher		8.75
WETLAND RISK (average of Sensitivity & Stressors)			1.60	Lower		2.77
	NOTE: A coor	o of 0 door not	moon the fund	tion or honofit i	a abaant from t	ho watland It

NOTE: A score of 0 does not mean the function or benefit is absent from the wetland. It means only that this wetland has a capacity that is equal or less than the lowest-scoring one, for that function or benefit, from among the 98 NB calibration wetlands that were assessed previously.

Cover Page: Basic Description of Assessment	WESP-AC version 2
Site Name:	Burchill Wind Energy Project - PLE-W-08
Investigator Name:	Derrick Mitchell
Date of Field Assessment:	7 August 2020
Nearest Town:	Lorneville (west Saint John), New Brunswick
Latitude (decimal degrees):	45.174913
Longitude (decimal degrees):	-66.20149
ls a map based on a formal on-site wetland delineation available?	Yes
Approximate size of the Assessment Area (AA, in hectares):	3.19
AA as percent of entire wetland (approx.). Attach sketch map if AA is smaller than the entire contiguous wetland.	
What percent (approx.) of the wetland were you able to visit?	100
What percent (approx.) of the AA were you able to visit?	100
Were you able to ask the site owner/manager about any of the questions?	No
Indicate here if you intentionally surveyed for rare plants, calciphile plants, or rare animals	Yes
Have you attended a WESP-AC training session? If so, indicate approximate month & year	Yes, September 2016
How many wetlands have you assessed previously using WESP-AC? (approx.)	100+
Comments about the site or this WESP-AC assessment (attach extra page if desired):	

Form OF (Office). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Conduct an assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the Q (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answering many of the questions below will equire using these online map viewers:

Google Earth Pro: https://www.google.com/earth/download/gep/agree.html
GeoNB: http://www.snb.ca/geonb1/ and http://www.snb.ca/geonb1/e/apps/apps-E.asp

Geomb. http://www.sinu.ca/geomb./ and http://www.sinu.ca/geomb./ geomb./ geomb Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity,

km. F3 Ponde Wetlar	ed Area Within 1 ed Waler & and Within 1 km. of Largest Nearby tated Tract or	Mark the province in which the AA is located by changing the 0 in the column next to it to a "1". Mark only one. New Brunswick Nova Scotla Prince Edward Island Newfoundland-Labrador The area of surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) within 1 km is: -0.01 hectare (about 10 m x 10 m). 0.01 - 0.1 hectare. 1.1 to 10 hectares. 10 to 10 hectares. The area of wetlands and surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) within 1 km is: -0.01 hectare (about 10 m x 10 m). 0.01 - 0.1 hectare. 1.1 to 10 hectare (about 10 m x 10 m). 0.01 - 0.1 hectare. 1.1 to 10 hectares.	1 0 0 0 0 0 0 0 1 0	This determines to which province's calibration wetlands the raw score of any wetland is normalised in the function and benefits models, it also triggers the automatic exclusion of indicators for which no spatial data exists in a particular province. "Adjacent" means not separated from the AA by a wide expanse (-50 m) of upland (including road "SO m wide). Include ponded areas likely to be hidden by wetland vegetation. If surface water extends beyond 1 km, include only the part within 1 km. Do not include tidal areas. Measure the an from aerial imagery using Google Earth Pro (click on Ruler icon in toolbar, then Polygon in pop-up memu). With the GeoNB viewer, enable the Wetlands layer, then measure with the Draw & Measur tool after specifying Aerial as the Basemap. However, do not rely entirely on wetland boundaries shown in online wetlands layers. [PH, SBM, WBN]

Vegeta	tated Tract or		0	
Vegeta	tated Tract or		1	
Vegeta	tated Tract or		0	4
Vegeta	tated Tract or	>100 hectares.	0	
Coma		The largest vegetated patch or corridor that includes the AA's vegetation plus all adjacent upland vegetation that is not lawn, row crops, heavily grazed lands, conifer plantation is:		See definition of adjacent in OF2. Use Google Earth Pro's polygon ruler (as described above). Exclude conifer plantations only if it is obvious that trees were planted in rows. [AM, PH, SBM, Ser
	uui	<0.01 hectare (about 10 m x 10 m).	0	
		0.01 - 0.1 hectare.	0	
		0.1 - 1 hectare.	0	
		1 to 10 hectares.	0	
		10 to 100 hectares.	0	
		100 to 1000 hectares.	0	
Distan		>1000 hectares. [<i>This is nearly always the answer in relatively undeveloped landscapes.</i>] The minimum distance from the edge of the AA to the edge of the closest <i>vegetated land</i> (but excluding row crops, lawn, conifer		To account distance on County County Day (Dulan Line tool) Occurs Down 8 Manager tool at
	nce to Large tated Tract	plantation) larger than 375 hectares (about 2 km on a side), is:		To measure distance, use Google Earth Pro (Ruler > Line tool). Or use Draw & Measure tool at GeoNB. The 375-ha criterion is from the Fundy Model Forest Project. [AM, PH, POL, SBM, Sens]
		-50 m, and not separated from the 375-ha vegetated area by any width of pawed roads, stretches of open water, row crops, bare ground, lawn, or impervious surface. Or the AA itself contains > 375 ha of vegetation. [This is often the answer in relatively undeveloped landscapes	1	
		<50 m, but completely separated from the 375-ha vegetated area by those features, and AA does not contain >375 ha of vegetation.	0	1
		50-500 m, and not separated.	0	1
		50-500 m, but separated by those features.	0	<u>]</u>
		0.5 - 5 km, and not separated.	0]
		0.5 - 5 km, but separated by those features.	0	
		None of the above (the closest patches or corridors which are that large are >5 km away).	0	
6 Herbai	·	The AA's vegetation cover is >10% herbaceous* but uplands within 5 km have <10% herbaceous cover. If so, enter "3" and continue to OF7. If not, consider: The AA's vegetation cover is >10% herbaceous* but uplands within 1 km have <10% herbaceous cover. If so enter "2" and continue to OF7. If not, consider: The AA's vegetation cover is >10% herbaceous* but uplands within 100 m of the wetland edge have <10% herbaceous cover. If so, enter 1". [**NOTE: Exclude lawns, row crops, heavily grazed lands, forest, shrublands. include moss as well as grasslike plants in this use of 'herbaceous vegetation']		For this question only, consider moss to be herbaceous vegetation. Determine the score by viewin arerial imagery in Google Earth after successively drawing or estimating the boundaries of the buff of 5 km, 1 km, and 100 m radius focused on the center of the AA. Circles of specified radius can b drawn in Google Earth Pro by clicking on the Ruler icon, then Circle in the pop-up menu. [AMW, P. POLV, SBMV, WBFV, WBNV]
7 Woody	dy Uniqueness	The AA's vegetation cover is >10% woody" but uplands within 5 km have <10% woody cover. If so, enter "3" and continue to OF8. If not, consider:	2	See above. Do not consider conifer plantations to be forest if it is obvious that trees were planted in rows. [AMv, PHv, POLv, SBMv]
		Consider: The AA's vegetation is >10% woody* but uplands within 1 km have <10% woody cover. If so enter *2" and continue to OF8. If not, consider:		IONS. [ANNY, FITY, FOLY, JUNY]
		The AA's vegetation is >10% woody" but uplands within 100 m of the wetland edge have <10% woody cover. If so, enter "1" [" NOTE: woody cover = trees & shrubs taller than 1 m.]		
	Vegetated Cover entage	Draw a 5-km radius circle measured from the center of the AA. Ignoring all permanent water in the circle, the percent of the remaining area that is wooded or unmanaged herbaceous vegelation (NOT lawn, row crops, bare or heavily grazed land, clearcuts, or confler plantations) is:	1	In Google Earth, draw the 5 km buffer and then estimate land cover percentages, or do GIS analy of an appropriate land cover layer. [AM, PH, POL, SBM, Sens]
		<5% of the land.	0	1
		5 to 20% of the land.	0	1
		20 to 60% of the land.	0	1
		60 to 90% of the land.	0	1
		>90% of the land. SKIP to OF10.	1	
	of Land Cover	Within the 5-km radius circle, and ignoring all permanent water, the land area that is bare or non-perennial cover is mostly:		[AM, SBM]
		Impervious surface, e.g., paved road, parking lot, building, exposed rock.	1	
9 Type o		Impervious surface, e.g., paved road, parking lot, building, exposed rock. Bare pervious surface, e.g., lawn, recent (<5 yrs ago) clearcut, dirt or gravel road, cropland, landslide, conifer plantation.	0	4
		Dear pervious surface, e.g., favin, recent (<5 yrs ago) clearcut, unit or graver road, cropiano, fanosinde, contien plantation. Measured along the maintained road nearest the AA, the distance to the nearest population center is:	U	"Population center" means a settled area with more than about 5 regularly- inhabited structures pe
Alterat	ation			
Alterat		1.1		square kilometer. In Google Earth, click on the Ruler icon, then Path, and draw and measure the
Alterat	nce by Road to est Population	<100 m.	0	route. Or use the GeoNB's Draw & Measure tool> Freehand Line to draw and measure the route
Alterat 10 Distan Neare	nce by Road to est Population	<100 m. 100 - 500 m.	0	route. Or use the GeoNB's Draw & Measure tool> Freehand Line to draw and measure the route! Settlements (click on Place Names in menu) or other areas not close to mapped settlements but
Alterat 10 Distan Neare	nce by Road to est Population	<100 m.		route. Or use the GeoNB's Draw & Measure tool> Freehand Line to draw and measure the route

OF11	Distance to Nearest	From the center of the AA, the distance to the nearest maintained public road (dirt or paved) is:		Determine this by viewing aerial imagery in Google Earth and measuring with the Ruler>Line tool. O
OFII	Maintained Road		0	use the GeoNB's Draw Line tool. [AM, FAv, FRv, NRv, PH, PU, SBM, STR, WBN]
		<10 m. 10 - 25 m.	0	
		25 - 50 m.	0	
		50 - 100 m.	0	
		100 - 500 m.	1	
0540	1801 100	>500 m.	0	LAND THE WAR THE CONDITION OF THE CONDIT
OF12	Wildlife Access	Draw a circle of radius of 5 km from the center of the AA. If mammals and amphibilans can move from the center of the AA to ALL other separate wetlands and ponds located within the circle without being forced to cross pavement (any width), lawns, bare ground, and/or marine waters, mark 1 = yes can move to all, 0 = no. Change to blank if there are no other wetlands within 5 km.	0	In NB, enable the Wetlands layer in GeoNB (despite its omissions) to show surrounding wetlands an roads, while estimating the location of the 5 km circle (or draw the 5 km circle in Google Earth Pro using the Circle tool and compare). Evaluate using Google Earth, being cautious to search for roads hidden under forest canopy. (AM, SBM, STR)
OF13	Distance to Ponded	The distance from the AA center to the closest (but separate) ponded water body visible in GoogleEarth imagery is:		In Google Earth, zoom in closely to examine the surrounding landscape for ponds, lakes, and
	Water	<50 m, and not separated by any width of paved roads, stretches of open water, row crops, lawn, bare ground, or impervious surface.	0	wellands that appear to be permanently flooded. Enable the GeoNB viewer's Wetlands layer as well [AM, PH, SBM, Sens, WBF, WBN]
		<50 m, but completely separated by those features.	0	
		50-500 m, and not separated.	0	
		50-500 m, but separated by those features. 0.5 - 1 km, and not separated.	0	
		0.5 - 1 km, but separated by those features.	0	
		None of the above (the closest patches or corridors that large are >1 km away).	- 1	
OF14	Distance to Large Ponded Water	The distance from the AA center to the closest (but separate) non-tidal body of water that is ponded during most of the year and is larger than 8 hectares during most of a normal year is:		Determine this by viewing aerial imagery in Google Earth. [Sens, WBF, WBN]
		<100 m. 100 m - 1 km.	0	
		1 - 2 km.	0	
		2-5 km.	0	
		5-10 km.	- 1	
		>10 km.	0	
OF15	Tidal Proximity	The distance from the AA edge to the closest tidal water body (regardless of its salinity) is:		In Google Earth, measure the distance to the ocean (including Bay of Fundy) or tidal river, whichever
		<100 m.	0	is closer. If you need to see how far upriver a river is tidal, see the KMZ file provided with this calculator for NB (NB Headtide). Points shown in those files are only an approximation, so local
		100 m - 1 km.	1	information if available may be preferable. [FA, WBF]
		1 - 5 km.	0	
		5-10 km. 10-40 km.	0	
		10-40 km.	0	
OF16	Upland Edge Contact	Select one:	Ü	[NR, SBM, Sens]
	3	The AA has no upland edge (or upland is <1% of perimeter). The AA is entirely surrounded by (& contiguous with) other wetlands or water.	0	
		1-25% of the AA's perimeter abuts upland (including filled areas). The rest adjoins other wetlands or water that is mostly wider than the AA.	0	
		25-50% of the AA's perimeter abuts upland. The rest adjoins other wetlands or water that is mostly wider than the AA.	0	
		50-75% of the AA's perimeter abuts upland. The rest adjoins other wetlands or water that is mostly wider than the AA.	0	
		More than 75% of the AA's perimeter abuts upland. Any remainder adjoins other wellands or water that is mostly wider than the AA. This will be true for most assessments done with WESP-AC.	1	
OF17	Flood Damage from Non	Within 5 km downstream or downslope of the AA (select first true choice):		In the GeoNB map viewer: click on "More" in upper right, then "Flood Information". Expand the men
	tidal Waters	Maps show Flood Zone or Flood Risk areas and there appears to be infrastructure vulnerable to river flooding not caused by tidal storm surges.	0	under it by clicking on the arrow to its left and the slider to its right. Uncheck the first (Limits of Data) box. Where available, LIDAR imagery can provide finer elevational resolution useful for flood modeling, (WSv)
		Maps show Flood Zone or Flood Risk areas, but infrastructure is absent or is not vulnerable to floods from a non-tidal river. In some cases levees, upriver dams, or other measures may partly limit damage or risk from smaller events.	0	mounting, (1004)
		Maps do not show Flood Zone or Flood Risk areas (or no such mapping has been done locally) and there appears to be infrastructure uulnerable to river flooding unrelated to tidal storm surges. Maps do not show Flood Zone or Flood Risk areas (or no such mapping has been done locally) and there is no infrastructure vulnerable	0	
OF18	Relative Elevation in Watershed	to river flooding unrelated to tidal storm surges. In Google Earth, enable the Terrain layer (lower left menu) and open the NB_Watersheds KMZ file that accompanies this calculator. Then determine the ANS approximate elevation (bottom right, NOT the "eye alt"). Then move cursor around to determine the watershed's		[FA, NR, Sens, SFSv, WCv, WSv]
OF19	Water Quality Sensitive	maximum and minimum elevation. Divide the AAS elevation by the (max-min). In Google Earth, open the KMZ file NB. Watershed Protected Area which accompanies this calculator. The AA is within such an area.	0.20	If an ACCDC report is available for this AA, it also may contain such information. [NRv]
OF20	Water duality Sensitive Watershed or Area Degraded Water	Enter 1 – yes, 0 – no. Sampling indicates a problem with concentrations of metals, hydrocarbons, nutrients, or other substances (excluding bacteria, acidic	Ü	May use existing data, or sample those waters as part of this wetland assessment. "Harmful" should
	Upstream	water, high temperatures) being present at levels harmful to aquatic life or humans, and:		be evaluated with regard to current federal or provincial water quality standards. [AM, FA, FR, NRv,
		The condition is present within the AA.	0	PRv, SRv, STR, WBF, WBN]
		The condition is present in waters within 1 km that flow into the AA, but has not been documented in the AA itself.	0	
		Sampling during both low water periods and times with high runoff (storms, snowmelt) indicates no problems in either the AA or inflowing waters	0	
		Data are insufficient (no or inadequate sampling within 1 km, or condition exists only at >1 km upstream). This is the situation for nearly all wetlands in this region.	1	
OF21	Degraded Water Downstream	The problem described above is downslope from the AA, and:		May use existing data, or monitor waters as part of this wetland assessment. [NRv, PRv, SRv]
	Downstream	The condition is present within 1 km downslope and connected to the AA by a channel.	0	
		The condition is present within 5 km downslope and connected to the AA by a channel, or within 1 km but not connected to the AA by a channel. Sampling during both low water periods and times with high runoff (storms, snowmell) indicates no problems in either the AA or inflowing	0	
		waters. Data are insufficient (no or inadequate sampling within 1 km, or condition exists only at >1 km upstream). This is the situation for nearly	0	
		all wetlands in this region.		
OF22	Wetland as a % of Its Contributing Area (Catchment)	From a topographic map and field observations, estimate the approximate boundaries of the catchment (CA) of the entire wetland of which he AI may be only a part. Then adjust those boundaries if necessary based on your field observations of the surroundinghan, and/or by using procedures described in the Manual. Divide the area of the wetland (not just the AA) by the approximate area of its catchment excluding the area of the wetland itself. When doing the calculation, if ponded water is adjacent to the wetland, include that in the wetlands area. The result its:		Topographic maps may be viewed online at the National Allas of Canada (Toporama): http://atlas.gc.ca/toporama/en/index.html [NR, PR, Sens, SR, WS]
		< 0.01, or catchment size unknown due to stormwater pipes that collect water from an indeterminate area.	0	
		0.01 to 0.1.	0	
		0.1 to 1.	1	
		>1 (wetland is larger than its catchment (e.g., wetland with flat surrounding terrain and no inlet, or is entirely isolated by dikes, or is a raised bog).	0	
OF23	Unvegetated Surface in the Contributing Area	The proportion of the AA's contributing area (measured to no more than 1000 m upslope) that is comprised of buildings, roads, parking lots, other pavement, exposed bedrock, landslides, and other mostly-bare surface is about:		[FA, INV, NRv, PRv, SRv, STR, WCv, WSv]
		<10%	1	1
		>25%.	0	

OF24	Transport From Upslope	A relatively large proportion of the precipitation that falls farther upslope in the CA reaches this wetland quickly as runoff (surface water), as		[NRv, PRv, SRv, WSv]
		indicated by the following:		
		(a) input channel is present,		
		(b) input channels have been straightened,		
		(c) upslope wetlands have been ditched extensively,		
		(d) land cover is mostly non-forest,		
		(e) CA slopes are steep, and/or		
		(f) most CA soils are shallow (bedrock near surface) and/or have high runoff coefficients.		
		This statement is:		
		Mostly true.	0	
		Somewhat true.	0	
		Mostly untrue.	1	
OF25	Aspect	The overland flow direction of most surface water (in streams, rivers, or runoff) that enters the AA is:		[AM, NR, SFS, WC, WS]
01 23	АЗРССС	The overlaid now direction of most surface water (in streams, twens), or fation, that enters the AV is.		[1111, 1111, 51 5, 110, 115]
		Northward (N, NE). north-facing contributing area.	0	
		Southward (S, SW), south-facing contributing area.	1	
		Other (E, SE, W, NW), or no detectable uphill slope or input channel (flat).		
OF24	Internal Flow Distance	The horizontal flow distance from the wetland's inlet to outlet is:		Identify inlets and outlets, if any, from topographic maps (use elevations to determine which are inlets

Date: 7 August 2020 Site Identifier: PLE-W-08 Investigator: Derrick Mitch

Form F (Field). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Walk for no less than 10 minutes from the wetland edge towards its core, in the part of the AA that is proposed for alteration. If no alteration is proposed, walk in a portion that appears to be most representative of the wetland overall. Walk only where it is safe and legal to do so. Conduct the assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answer these questions primarily based on your onsite observations and interpretations. Do not write in shaded parts of this data form. Answering some questions accurately may require conferring with the landowner or other knowledgable persons and/or reviewing aerial imagery. For most wetlands, completing this field data form will require 1-2 hours on a site. For a list of functions to which each question pertains, see the accompanying Interpretations form. For detailed descriptions of each WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage & Delay, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity, STR= Stressors.

,,	to die	Condition of t	D	Definition In 1
#	Indicators	Condition Choices	Data	Definitions/Explanations
1	Wetland Type	Follow the key below and mark the ONE row that best describes MOST of the vegetated part of the AA:		Ericaceous shrubs are ones in the heather family (Ericaceae). Most have leathery evergreen leaves. They include rhododendron, azalea, swamp laurel, leatherleaf, Labrador tea, and others. Most require
		A. Moss and/or lichen cover more than 25% of the ground. Often dominated by ericaceous shrubs (e.g., Labrador tea) or other acid-tolerant plants (e.g., bog cranberry, pitcher plant, sundew, orchids). Substrate is mostly undecomposed peat. Choose between A1 and A2 and mark the choice with a 1 in their adjoining column. Otherwise go to B below.		acidic soil. Although not in the family Ericaceae, sweetgale (<i>Myrica gale</i>) should be counted also. [AM, CS, FA, FR, INV, NR, OE, PH, Sens, SFS, WBF, WBN]
		A1. Surface water is usually absent or, if present, pH is typically <4.5 and conductivity is usually <100 µS/cm (<64 ppm TDS). Trees are absent or nearly so. Sedge cover usually sparse or absent but cottongrass and/or lichen cover may be extensive, as well as cloudberry, lingonberry, sheep laurel, and a sedge (Carex rariflora). Weltland surface and surrounding landscape are seldom sloping and weltland often is domed (convex). Inlet and outlet channels are usually absent. If known, pH of peat is <4.0.	0	
		A2. Not A1. Surface water, if present, has pH typically >4.5 and conductivity is usually >100 µS/cm (>64 ppm TDS). Sedge cover is usually extensive, and/or tree and tall shrub cover is extensive. Sometimes at toe of slope or edge of water body. An exit channel is usually present. Wetter than A1 and peat depth may be shallower (<2 m).	0	
		B. Moss and/or lichen cover less than 25% of the ground. Soil is mineral or decomposed organic (muck). Choose between B1 and B2 and mark the choice with a 1 in their adjoining column:		
		B1. Trees and shrubs taller than 1 m comprise more than 25% of the vegetated cover. Surface water is mostly absent or inundates the vegetation only seasonally (e.g., vernal pools or floodplain).	1	
		B2. Not B1. Tree & tall shrubs comprise less than than 25% of the vegetated cover. Vegetation is mostly herbaceous, e.g., cattail, bulrush, burreed, pond lily, horsetail. Surface water may be extensive and fluctuates seasonally, being either persistent or drying up partly or entirely.	0	
A sh nclud adja	ould also include part of a e the open water part adj cent " is used synonymou	he AA should include all persistent waters in ponds smaller than 8 hectares (-283 m on a side) that are adjacent to the AA. The the water area of adjacent ponded water larger than 8 ha and adjacent rivers wider than 20 m. Specifically, the AA should iacent to wetland vegetation and equal in width to the average width of that vegetated zone. Throughout this data form usly with abutting, adjoining, bordering, contiguous and means no upland (manmade or natural) completely separates the directly shared edge. Features joined only by a channel are not necessarily considered to be adjacent a large portion of their		
	must match. The featur	es do not have to be hydrologically connected in order to be considered adjacent.		
2	Wetland Types - Adjoining or Subordinate	If the AA is smaller than 1 ha, mark all other types that occupy more than 1% of the vegetated AA. If the AA is larger than 1 ha, mark all other types which are within or adjacent to the AA and occupy more than 1 ha, as visible from the AA or as interpreted from aerial imagery. Do not mark again the type marked in F1.		1 hectare is 10,000 sq. m or about 2.5 acres. It could have dimensions of 100 m by 100 m, 1000 m b 10 m, or similar. [AM, INV, SBM, WBF]
		A1. A2.	0	
		B1.	0	
		B2.	0	
3	Woody Height & Form Diversity	Following EACH row below, indicate with a number code the percentage of the living vegetation in the AA which is occupied by that feature (6 if >95%, 5 if 75-95%, 4 if 50-75%, 3 if 25-50%, 2 if 5-25%, 1 if <5%, 0 if none). If the vegetated part of the AA is largely herbaceous (non-woody) vegetation, these percentages should not sum to 100%.		Deciduous shrubs in this region usually include buttonbush, Labrador tea, bayberry (Morella) huckleberry, cranberry, cloudberry, sweetglale, alder, willow, birch, ash, dogwood, and a few of you assigned a code of 3 or higher to any of the first four choices and the ground cover beneal trees/shrubs is <25% moss, then question F1 might be "B1". [CS, INV, NR, PH, POL, SBM, Se
		coniferous trees (may include tamarack) taller than 3 m. deciduous trees taller than 3 m.	5	accessinates to recommendation of the first term
		conferous or ericaceous shrubs or trees 1-3 m tall not directly below the canopy of trees.	1	
		deciduous shrubs or trees 1-3 m tall not directly below the canopy of trees.	0	
		coniferous or ericaceous shrubs <1 m tall not directly below the canopy of taller vegetation. deciduous shrubs or trees <1 m tall (e.g., deciduous seedlings) not directly below the canopy of taller vegetation.	0	
lote :	If none of top 4 rows in	F3 was marked 2 or greater , SKIP to F9 (N fixers).		
4	Dominance of Most Abundant Shrub	Determine which two woody plant species comprise the greatest portion of the low (<3 m) woody cover . Then choose one:		[PH, POL, SBM, Sens]
	Species	those species together comprise > 50% of such cover. those species together do not comprise > 50% of such cover.	0	
5	Woody Diameter Classes	mass species together do not comprise > 3 or 3	U	Estimate the diameters at chest height. If small-diameter trees are overtopped (shaded) by larger ones, visualise a "subcanopy" at the average height of the smaller-dbh trees, to serve as a basis for
	Ciasses	conferous, 1-9 cm diameter and >1 m tall.	1	minimum 5% canopy requirement in this question. The trees and shrubs need not be wetland specie
		broad-leaved deciduous 1-9 cm diameter and >1 m tall.	1	[AM, CS, POL, SBM, Sens, WBN]

FieldF form - Non-tidal Page 3 of 5

:37	Interspersion of	During most of the part of the growing season when water is present, the spatial pattern of emergent vegetation within the water is mostly:		[AM, FA, FR, INV, NR, OE, PH, PR, SBM, SR, WBF, WBN]
	Emergents & Open Water	Scattered. More than 30% of such vegetation forms small islands or corridors surrounded by water.	0	
	water	Intermediate.	0	
		Clumped. More than 70% of such vegetation is in bands along the wetland perimeter or is clumped at one or a few sides of the surface water area.	0	
	Persistent Deepwater	If the deepest patch of surface water (flowing or ponded) in or directly adjacent to the AA is mostly deeper than 0.5 m for >2 weeks during the	0	
	Area Non-vegetated Aquatic	growing season, enter "1" and continue. If not, enter "0" and SKIP to F42 (Connection). During most of the growing season and in waters deeper than 0.5 m, the cover for fish, aquatic invertebrates, and/or amphibians that is		For this question, consider only the wood that is at or above the water surface. Estimates of underwater
	Cover	provided NOT by living vegetation, but by accumulations of dead wood and undercut banks is:		wood based only on observations from terrestrial viewpoints are unreliable so should not be attempted.
		Little or none. Intermediate.	0	[AM, FA, FR, INV]
		Extensive.	0	
F40	Isolated Island	The AA contains (or is part of) an island or beaver lodge within a lake, pond, or river, and is isolated from the shore by water depths >1 m on all sides during an average June. The island may be solid, or it may be a floating vegetation mat that is sufficiently large and dense to support a waterbird nest.	0	[WBN]
	Duckweed	Al some time of the year, mats of algae and/or duckweed are likely to cover >50% of the AA's otherwise-unshaded water surface, or blanket >50% of the underwater substrate. If true, enter "1" in next column. If untrue or uncertain, enter "0".	0	[EC, PR, WBF]
42	Channel Connection & Outflow Duration	The most persistent surface water connection (outlet channel or pipe, dilch, or overbank water exchange) between the AA and a downslope stream network is; [Note: If the AA represents only part of a wetland, answer this according to whichever is the least permanent surface connection: the one between the AA and the rest of the wetland, or the surface connection between the wetland and the downslope stream network.] Persistent (surface water flows out for >9 months/year).	0	Consider the connection regardless of whether the surface water is frozen. The "downslope stream network" could consist of ditches, rivers, ponds, or lakes which eventually connect to the ocean. If this cannot be determined while visiting the AA, consult topographic maps perhaps by viewing these of this with Toporama (http://atlas.nrcan.gc.ca/toporama/en/index.html) [CS, FA, FR, NR, OE, PR, Sens, SFS SR, WCv, WS]
		Seasonal (surface water flows out for 14 days to 9 months/year, not necessarily consecutive).	1	
		Temporary (surface water flows out for <14 days, not necessarily consecutive). None but maps show a stream network downslope from the AA and within a distance that is less than the AA's length. SKIP to F47 (pH	0	
		Measurement).	0	
		No surface water flows out of the wetland except possibly during extreme events (<once (ph="" 10="" a="" an="" ditch,="" f47="" flows="" into="" lacks="" lake="" measurement).<="" only="" or="" or,="" outlet.="" per="" skip="" td="" that="" to="" water="" wetland,="" years).=""><td>U</td><td></td></once>	U	
-43	Outflow Confinement	During major runoff events, in the places where surface water exits the AA or connected waters nearby, the water:		"Major runoff events" would include biennial high water caused by storms and/or rapid snowmelt. [CS, NR, OE, PR, Sens, SR, STR, WS]
		Mostly passes through a pipe, culvert, narrowly breached dike, berm, beaver dam, or other partial obstruction (other than natural topography) that does not appear to drain the wetland artificially during most of the growing season.	0	
		Leaves through natural exits (channels or diffuse outflow), not mainly through artificial or temporary features. Is exported more quickly than usual due to ditches or pipes within the AA or connected to its outlet, or within 10 m of the AA's edge, which	0	
-44	T-lb. dans Ob annual	drain the welland artificially, or water is pumped out of the AA. At least once annually, surface water from a tributary channel that is >100 m long moves into the AA. Or, surface water from a larger	Ŭ	If inlet tributaries cannot be searched for due to inaccessibility of part of the AA, follow suggestions in
		permanent water body adjacent to the AA spills into the AA. If it enters only via a pipe, that pipe must be fed by a mapped stream or lake further upslope. If no, SKIP to F47 (pH Measurement).	0	F42 above. [NRv, PH, PRv, SRv]
F45	Input Water Temperature	Based on lack of shade, water source characteristics, or actual temperature measurements, the inflow is likely to be warmer than surface water in the AA during part of most years. Enter 1= yes, 0= no.	0	[WCv]
	Throughflow Resistance	During its travel through the AA at the time of peak annual flow, water arriving in channels: [select only the ONE encountered by most of the incoming water].		[FA, FR, INV, NR, OE, PR, SR, WS]
	Resistance	Does not bump into many plant stems as it travels through the AA. Nearly all the water conlinues to travel in unvegetated (often incised) channels that have minimal contact with welland vegetation, or through a zone of open water such as an instream pond or lake.	0	
		Bumps into herbaceous vegetation but mostly remains in fairly straight channels.	0	
		Bumps into herbaceous vegetation and mostly spreads throughout, or is in widely meandering, multi-branched, or braided channels.	0	
		Bumps into tree trunks and/or shrub stems but mostly remains in fairly straight channels.	0	
		Bumps into tree trunks and/or shrub stems and follows a fairty indirect path from entrance to exit (meandering, multi-branched, or braided).	0	
-47	pH Measurement	The pH in most of the AA's surface water:		Preferably, measure this in larger areas of ponded surface water within the AA, or in streams that have
		Was measured, and is: [enter the reading in the column to the right.]		passed through (not along) most of the AA. Unless surface water is completely absent, do not dig holes or make depressions in peat in order to provide water for this measurement. Avoid measuring near
		Was not measured but surface water is present and is darkly tea-coloured. Or if no surface water, then mosses and plants that indicate peatland (e.g., Labrador tea) are prevalent. Enter *1". Neither of above. Enter *1".	0	roads or in puddles formed only by recent rain. [AM, FA, FR, NR, WBF, PH, PR, Sens, WBF, WBN]
	TDS and/or	The TDS (total dissolved solids) or conductivity off the AA's surface water is: (select the first true row with information):		See above for measurement guidance. [FR, INV, NRv, PH, PRv, Sens]
	Conductivity	TDS is: [Enter the reading in ppm or mg/L in the column to the right, if measured, or answer next row.]		
		Conductivity is [Enter the reading in µSkcm in the column to the right.] Was not measured, but plants that indicate saline conditions cover much of the vegetated AA. Enter *1*.	0	
-49	Danier Dankahilik	Neither of above	1	[FA, FR, PH, SBM, Sens, WBF, WBN]
77	Beaver Probability	Use of the AA by beaver during the past 5 years is (select most applicable ONE): Evident from direct observation or presence of gnawed limbs, dams, tracks, dens, lodges, or extensive stands of water-killed trees (snags).	0	[r.v, r.v, som, sells, wor, word]
		Likely based on known occurrence in the region and proximity to sultable habitat, which may include: (a) a persistent freshwater wetland,	0	
		pond, or lake, or a perennial low or mid-gradient (<10%) channel, and (b) a corridor or multiple stands of hardwood trees and shrubs in	U	
		vegetated areas near surface water. Unlikely because site characteristics above are deficient, and/or this is a settled area or other area where beaver are routinely removed.	1	
	Groundwater Strength of Evidence	Select first applicable choice:		Adhere to these criteria strictly do not use personal judgment based on fen conditions, pH, or other evidence. Consult topographic maps to detect breaks in slope described here. Rust deposits
	OF EVIDENCE	Springs are known to be present within the AA, or if groundwater levels have been monitored, that has demonstrated that groundwater	0	associated with groundwater seeps may be most noticeable as orange discoloration in ice formations
		primarily discharges to the wetland for longer periods during the year than periods when the wetland recharges the groundwater.		along streams during early winter. [AM, CS, FA, FR, INV, NR, OE, PH, PRv, SFS, WC, WS]
		Most of the AA has a slope of >5%, or is very close to the base of a natural slope longer than 100 and much steeper than the slope of the AA, AND the pH of surface water, if known, is >5.5.	0	along streams during early winter. [AM, CS, FA, FR, INV, NR, OE, PH, PRv, SFS, WC, WS]

53	Type of Cover in Buffer	Within 30 m upslope of where the wetland transitions to upland, the upland land cover that is NOT perennial vegetation is mostly (mark ONE):		[AM, FA, INV, NRv, PH, POL, SBM, STR, WBN]
	Type or devel in Bullet			
		Impervious surface, e.g., paved road, parking lot, building, exposed rock.	0	
		Bare or nearly bare pervious surface or managed vegetation, e.g., lawn, row crops, unpaved road, dike, landslide.	0	
54	Buffer Slope	The steepest and/or most disturbed part of the upland area that is within 30 m of the wetland and occupies >10% of that upland area has a percent slope of:		[NRv, PRv, Sens, SRv]
		<1% (flat almost no noticeable slope) or all the area within 30 m of the AA edge is other wetlands.	0	
		2-5%.	0	
		5-30%. >30%.	0	4
55	Cliffs or Steep Banks	>30%. In the AA or within 100 m, there are elevated terrestrial features such as cliffs, talus slopes, stream banks, or excavated pits (but not riprap)	0	Do not include upturned trees as potential den sites. [POL, SBM]
33	Cilis of Steep Baliks	In the zero of within 1 on, interest are expensed terrestation realized such as callos, made suppes, suream datas, or excervated pais Qualiform propy that extend at least 2 m nearly vertically, are unvegetated, and potentially contain crevices or other substrate suitable for nesting or den areas. Enter 1 (yes) or 0 (no).	0	DO NOI INCIDURE UPERS AS POTENTIAL DEL SILES. [F.O.L., DUM]
56	New or Expanded Wetland	Human actions within or adjacent to the AA have persistently expanded a naturally occurring wetland or created a wetland where there previously was none (e.g., by excavation, impoundment):		Determine this using historical aerial photography, old maps, soil maps, or permit files as available [C NR, OE, PH, Sens]
		No.	1	
		Yes, and created or expanded 20 - 100 years ago.	0	
		Yes, and created or expanded 3-20 years ago.		4
		Yes, and created or expanded within last 3 years.	0	-
		Yes, but time of origin or expansion unknown. Unknown if new or expanded within 20 years or not.	0	-
57	Burn History	More than 1% of the AA's previously vegetated area:	0	Look for charred soil or stumps (in multiple widely-spaced locations) or ask landowner. [CS, PH, STR]
	Durit History			2 South of Statings (in manages makey Spacea totalions) of ask tandomici. [63, FH, STK
		Burned within past 5 years.	0	4
		Burned 6-10 years ago.	0	4
		Burned 11-30 years ago.	0	
		Burned >30 years ago, or no evidence of a burn and no data.	1	(DLI CTD WOE)
58	Visibility	The maximum percentage of the welland that is visible from the best vantage point on public roads, public parking lots, public buildings, or public maintained trails that intersect, adjoin, or are within 100 m of the AA (select one) is:		[PU, STR, WBFv]
		<25%.		
		25·50%. >50%.	0	4
59	Non-consumptive	Assuming access permission was granted, select ALL statements that are true of the AA as it currently exists:	Ü	[PU, STR]
J7	Uses - Actual or			[10, 310]
	Potential	For an average person, walking is physically possible <u>in</u> (not just near) >5% of the AA during most of the growing season, e.g., free of deep water and dense shrub thickets.	1	
		Maintained roads, parking areas, or foot-traits are within 10 m of the AA, or the AA can be accessed part of the year by boats arriving via contiquous waters.	0	
		Within or near the AA, there is an interpretive center, trails with interpretive signs or brochures, and/or regular guided interpretive tours.	0	
60	Unvisited Core Area	The percentage of the AA almost never visited by humans during an average growing season probably comprises: [Note: Only include the part actually walked or driven (find simply viewed from) with a vehicle or boat. Do not include visitors on traits outside of the AA unless more than half the welfand is visible from the traits and they are within 30 m of the welfand edge. In that case include only the accupied by the		[AM, FAv, FRv, PH, PU, SBM, STR, WBF, WBN]
		trail.]		
		<5% and no inhabited building is within 100 m of the AA.	0	
		<5% and inhabited building is within 100 m of the AA.	0	
		5-50% and no inhabited building is within 100 m of the AA.	0	
		5-50% and inhabited building is within 100 m of the AA.	0	
		50-95%, with or without inhabited building nearby.	0	
61	Fraguently Violted	>95% of the AA with or without inhabited building nearby.		TAMA DILI DILI COMI CTD. MIDE MIDAN
01	Frequently Visited Area	The part of the AA visited by humans almost daily for several weeks during an average growing season probably comprises: [See note above.]		[AM, PH, PU, SBM, STR, WBF, WBN]
		<5%. If F60 was answered ">95%" (mostly never visited), SKIP to F64.	1	
		5-50%.	0	4
		50-95%.	0	4
	DIAD O II	>95% of the AA.	0	(DLL DLE
	BMP - Soils	Boardwalks, paved trails, fences or other infrastructure and/or well-enforced regulations appear to effectively prevent visitors from walking on soil within nearly all of the AA when the soil is unfrozen. Enter "1" if true.	0	[PH, PU]
63	BMP - Wildlife Protection	Fences, observation blinds, platforms, pawed trails, exclusion periods, and/or well-enforced prohibitions on motorised boats, off-leash pets, and off froad welnickes appear to effectively exclude or divert visitors and their pets from the AA at critical times in order to minimize disturbance of wildlife (except during hunting seasons). Enter "1" if true.	0	[AM, PU, WBF, WBN]
64	Consumptive Uses	Recent evidence was found within the AA of the following potentially-sustainable consumptive uses. Select ALL that apply.		[FAv, FRv, WBFv]
	(Provisioning Services)	Low-impact commercial timber harvest (e.g., selective thinning).	0	1
		Commercial or traditional-use harvesting of native plants, their fruits, or mushrooms.	0	1
		Waterfowl hunting.	0	1
		Fishing.	0	1
		Trapping of furbearers.	0	1
		None of the above.	1	
65	Domestic Wells	The closest wells or water bodies that currently provide drinking water are:		[NRv]
		Within 0-100 m. of the AA.	0	
		100-500 m. away.	0	1
		>500 m. away, or no information.	1	1
66	Calcareous Fen	The AA is, or is part of, a calcareous fen. See the Plants_Calcar worksheet in the accompanying Supplnfo file for list of plant indicators	0	[PH, PR]
		(calciphiles). Enter 1 If more than two Strong or more than five Moderate calciphile species are present; otherwise enter 0, but if not able to		T · ·

To estimate Mild (1 point) <5% of wetland and <5% of its upland edge (if any). >1 yr ago. Short-term, revegetated, not intense.	0.00

FieldS form Non-tidal 2

Assessment Area (AA) Results:

Wetland ID: PLE-W-08

Date: 7 August 2020

Observer: Derrick Mitchell

Latitude & Longitude (decimal degrees): 45.174913, -66.20149

Scores will appear below after data are entered in worksheets OF, F, and S. See Manual for definitions and descriptions of how scores were computed.

computed.						
Wetland Functions or Other Attributes:	Function Score (Normalised)	Function Rating	Benefits Score (Normalised)	Benefits Rating	Function Score (raw)	Benefits Score (raw)
Water Storage & Delay (WS)	2.99	Moderate	0.42	Lower	4.04	0.50
Stream Flow Support (SFS)	2.81	Lower	3.33	Moderate	1.50	1.94
Water Cooling (WC)	0.00	Lower	0.00	Lower	0.00	0.00
Sediment Retention & Stabilisation (SR)	2.69	Moderate	0.53	Lower	5.00	0.32
Phosphorus Retention (PR)	3.68	Moderate	0.17	Lower	5.51	0.49
Nitrate Removal & Retention (NR)	0.91	Lower	1.56	Lower	4.39	2.50
Carbon Sequestration (CS)	8.05	Higher			8.03	
Organic Nutrient Export (OE)	5.97	Higher			5.50	
Anadromous Fish Habitat (FA)	0.00	Lower	0.00	Lower	0.00	0.00
Resident Fish Habitat (FR)	0.00	Lower	0.00	Lower	0.00	0.00
Aquatic Invertebrate Habitat (INV)	5.08	Moderate	0.56	Lower	5.66	1.55
Amphibian & Turtle Habitat (AM)	2.09	Lower	4.73	Moderate	4.41	4.96
Waterbird Feeding Habitat (WBF)	0.00	Lower	0.00	Lower	0.00	0.00
Waterbird Nesting Habitat (WBN)	0.00	Lower	0.00	Lower	0.00	0.00
Songbird, Raptor, & Mammal Habitat (SBM)	5.89	Moderate	10.00	Higher	4.89	10.00
Pollinator Habitat (POL)	7.92	Higher	6.67	Moderate	6.38	6.67
Native Plant Habitat (PH)	7.03	Higher	6.89	Higher	5.92	5.98
Public Use & Recognition (PU)			2.18	Lower		1.88
Wetland Sensitivity (Sens)			1.87	Lower		2.76
Wetland Ecological Condition (EC)			7.83	Higher		8.75
Wetland Stressors (STR) (higher score means more stress)			1.64	Lower		2.86
Summary Ratings for Grouped Functions:						
HYDROLOGIC Group (WS)	2.81	Moderate	0.42	Lower	4.04	0.50
WATER QUALITY SUPPORT Group (max+avg/2 of SR, PR, NR, CS)	3.05	Lower	1.16	Lower	6.88	1.80
AQUATIC SUPPORT Group (max+avg/2 of SFS, INV, OE, WC)	4.72	Moderate	2.32	Moderate	4.41	1.55
AQUATIC HABITAT Group (max+avg/2 of FA, FR, AM, WBF, WBN)	1.26	Lower	2.84	Lower	2.64	2.98
TRANSITION HABITAT Group (max+avg/2 of SBM, PH, POL)	7.43	Moderate	8.93	Higher	6.05	8.77
WETLAND CONDITION (EC)			7.83	Higher		8.75
WETLAND RISK (average of Sensitivity & Stressors)			1.76	Lower		2.81
	NOTE: A coor	o of 0 door not	moon the fund	tion or honofit i	a abaant from t	ho watland It

NOTE: A score of 0 does not mean the function or benefit is absent from the wetland. It means only that this wetland has a capacity that is equal or less than the lowest-scoring one, for that function or benefit, from among the 98 NB calibration wetlands that were assessed previously.

Cover Page: Basic Description of Assessment	WESP-AC version 2
Site Name:	Burchill Wind Energy Project - PLE-W-10
Investigator Name:	Derrick Mitchell
Date of Field Assessment:	31 July 2020
Nearest Town:	Lorneville (west Saint John), New Brunswick
Latitude (decimal degrees):	45.176867
Longitude (decimal degrees):	-66.195094
Is a map based on a formal on-site wetland delineation available?	Yes
Approximate size of the Assessment Area (AA, in hectares):	3.30
AA as percent of entire wetland (approx.). Attach sketch map if AA is smaller than the entire contiguous wetland.	
What percent (approx.) of the wetland were you able to visit?	100
What percent (approx.) of the AA were you able to visit?	100
Were you able to ask the site owner/manager about any of the questions?	No
Indicate here if you intentionally surveyed for rare plants, calciphile plants, or rare animals	Yes
Have you attended a WESP-AC training session? If so, indicate approximate month & year	Yes, September 2016
How many wetlands have you assessed previously using WESP-AC? (approx.)	100+
Comments about the site or this WESP-AC assessment (attach extra page if desired):	

Form OF (Office). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Conduct an assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answering many of the questions below will equire using these online map viewers:

Google Earth Pro: https://www.google.com/earth/download/gep/agree.html

GeoNB: http://www.snb.ca/geonb1/ and http://www.snb.ca/geonb1/e/apps/apps-E.asp

Geons: http://www.snb.ca/geonol/ and http://www.snb.ca/geonol/e/apps/apps/apps-e.asp
For most wetlands, completing this office data form will require 1-2 hours. For a list of functions to which each question pertains, see bracketed abbreviations in the Definitions/Explanations column. For detailed descriptions of each
WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus
Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding
Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity,

#	Indicators	Condition Choices	Data	Definitions/Explanations
F1	Province	Mark the province in which the AA is located by changing the 0 in the column next to it to a *1". Mark only one.		This determines to which province's calibration wetlands the raw score of any wetland is normalised
		New Brunswick	1	In the function and benefits models, it also triggers the automatic exclusion of indicators for which no spatial data exists in a particular province.
		Nova Scotia	0	Sparad and Online in a particular province.
		Prince Edward Island	0	
		Newfoundland-Labrador	0	
2	Ponded Area Within 1 km.	The area of surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) within 1 km is:		"Adjacent" means not separated from the AA by a wide expanse (>50 m) of upland (including road >50 m wide). Include ponded areas likely to be hidden by wetland vegetation. If surface water
		<0.01 hectare (about 10 m x 10 m).	0	extends beyond 1 km, include only the part within 1 km. Do not include tidal areas. Measure the a from aerial imagery using Google Earth Pro (click on Ruler icon in toolbar, then Polygon in pop-up
		0.01 - 0.1 hectare.	0	menu). With the GeoNB viewer, enable the Wetlands layer, then measure with the Draw & Measu
		0.1 - 1 hectare.	0	tool after specifying Aerial as the Basemap. However, do not rely entirely on wetland boundaries
		1 to 10 hectares.	1	shown in online wetlands layers. [PH, SBM, WBN]
		10 to 100 hectares.	0	
3		Floor nectures. The area of wetlands and surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) with twis:		See definition of adjacent in OF2. If the AA's wetland vegetation extends beyond 1 km, include on the part within 1 km. "Ponded" means not flowing in rivers or streams. [Sens, WBF]
		<0.01 hectare (about 10 m x 10 m).	0	, , , , , , , , , , , , , , , , , , ,
		0.01 - 0.1 hectare.	0	
		0.1 - 1 hectare.	0	
		1 to 10 hectares.	1	
		10 to 100 hectares.	0	
		>100 hectares.	0	1
4	Size of Largest Nearby Vegetated Tract or	The largest vegetated patch or corridor that includes the AA's vegetation plus aladjacent upland vegetation that is not lawn, row crops, heavily grazed lands, conifer plantation is:		See definition of adjacent in OF2. Use Google Earth Pro's polygon ruler (as described above). Exclude conifer plantations only if it is obvious that trees were planted in rows. [AM, PH, SBM, Ser
	Corridor	<0.01 hectare (about 10 m x 10 m).	0	
		0.01 - 0.1 hectare.	0	1
		0.1 - 1 hectare.	0	
		1 to 10 hectares.	0	
		10 to 100 hectares.	0	
		100 to 1000 hectares.	0	
		>1000 hectares. [This is nearly always the answer in relatively undeveloped landscapes]	1	
5	Distance to Large Vegetated Tract	The minimum distance from theedge of the AA to the edge of the closest <i>vegetated land</i> (but excluding row crops, lawn, conifer plantation) larger than 375 hectares (about 2 km on a side), is:		To measure distance, use Google Earth Pro (Ruler > Line tool). Or use Draw & Measure tool at GeoNB. The 375-ha criterion is from the Fundy Model Forest Project. [AM, PH, POL, SBM, Sens]
		450 m, and not separated from the 375-ha vegetated area by any width opaved roads, stretches of open water, row crops, bare ground lawn, or impervious surface. Or the AA itself contains >375 ha of vegetation. [This is often the answer in relatively undeveloped landscal.]		
		<50 m, but completely separated from the 375-ha vegetated area by those features, and AA does not contain >375 ha of vegetation.	0	
		50-500 m, and not separated.	0	
		50-500 m, but separated by those features.	0	
		0.5 - 5 km, and not separated.	0	
		0.5 - 5 km, but separated by those features.	0	4
.,		None of the above (the closest patches or corridors which are that large are >5 km away).	0	
F6	Herbaceous Uniqueness	The AA's vegetation cover is >10% herbaceous* but uplands within 5 km have <10% herbaceous cover. If so, enter "3" and continue to OF7. If not, consider: The AA's vegetation cover is >10% herbaceous* but uplands within 1 km have <10% herbaceous cover. If so enter "2" and continue to OF7. If not, consider: The AA's vegetation cover is >10% herbaceous* but uplands within 100 m of the wetland edge have <10% herbaceous cover. If so, ent "1". "I'. "NOTE: Exclude lawns, row crops, heavily grazed lands, forest, shrublands. Include moss as well as grasslike plants in this use of "herbaceous vegetation"]	er	For this question only, consider moss to be herbaceous vegetation. Determine the score by viewle arefal imagery in Google Earth after successively drawing or estimating the boundaries of the buff of 5 km, 1 km, and 100 m radius focused on the center of the AA. Circles of specified radius can in drawn in Google Earth Pro by clicking on the Ruler Icon, then Circle in the pop-up menu. [AMv. P. POLV, SBMv, WBFv, WBNv]
-7	Woody Uniqueness	The AA's vegetation cover is >10% woody" but uplands within 5 km have <10% woody cover. If so, enter "3" and continue to OF8. If no	t, 2	See above. Do not consider conifer plantations to be forest if it is obvious that trees were planted i
		consider: The AAI's vegetation is >10% woody* but uplands within 1 km have <10% woody cover. If so enter "2" and continue to OF8. If not, consider:		rows. [AMv, PHv, POLv, SBMv]
		Curisuer. The AA's vegetation is >10% woody' but uplands within 100 m of the wetland edge have <10% woody cover. If so, enter "1" ["NOTE: woody cover = trees & shrubs taller than 1 m.]		
8	Local Vegetated Cover Percentage	Draw a 5-km radius circle measured from the center of the AA. Ignoring all permanent water in the circle, the percent of the remaining a that is wooded or unmanaged herbaceous vegetation (NOT lawn, row crops, bare or heavily grazed land, clearcuts, or conifer plantation.		In Google Earth, draw the 5 km buffer and then estimate land cover percentages, or do GIS analys of an appropriate land cover layer. [AM, PH, POL, SBM, Sens]
		<5% of the land.	0	
		5 to 20% of the land.	0	1
		20 to 60% of the land.	0	1
		60 to 90% of the land.	0	1
		>90% of the land. SKIP to OF10.	1	1
9	Type of Land Cover	Within the 5-km radius circle, and ignoring all permanent water, the land area that is bare or non-perennial cover is mostly:		[AM, SBM]
	Alteration		^	
		Impervious surface, e.g., paved road, parking lot, building, exposed rock. Bare pervious surface, e.g., lawn, recent (<5 yrs ago) clearcut, dirt or gravel road, cropland, landslide, conifer plantation.	0	-{
10	Distance by Road to	Bare pervious surrace, e.g., lawn, recent (<s aa,="" ago)="" along="" center="" clearcut,="" confier="" cropiand,="" dirt="" distance="" gravei="" is:<="" landslide,="" maintained="" measured="" nearest="" nearestpopulation="" or="" plantation.="" road="" road,="" td="" the="" to="" yrs=""><td>U</td><td>"Population center" means a settled area with more than about 5 regularly- inhabited structures pe</td></s>	U	"Population center" means a settled area with more than about 5 regularly- inhabited structures pe
10	Nearest Population			reopulation center means a settled area with more than about 5 regularly- inhabited structures persure square kilometer. In Google Earth, click on the Ruler icon, then Path, and draw and measure the
	Center	<100 m.	0	route. Or use the GeoNB's Draw & Measure tool> Freehand Line to draw and measure the route
		100 - 500 m.	0	Settlements (click on Place Names in menu) or other areas not close to mapped settlements but
		0.5- 1 km.	0	which meet the criteria.[FAv, FRv, NRv, PH, PU, SBM, WBFv]
		1 - 5 km.	1	
		>5 km.	0	

UFILL	1 Distance to Nearest From the center of the AA, the distance to the nearest maintained public road (dirt or paved) is:		Determine this by viewing aerial imagery in Google Earth and measuring with the Ruler>Line tool.	
	Maintained Road	From the center of the AA, the distance to the hearest maintained public road (dirt of paved) is:		use the GeoNB's Draw Line tool. [AM, FAv, FRv, NRv, PH, PU, SBM, STR, WBN]
		<10 m.	0	
		10 - 25 m.	0	
		25 - 50 m.	0	
		50 - 100 m.	0	
		100 - 500 m.	1	
0512	IARI-HIE- A	>500 m.	0	In NID and the Wallands Investor Continue to the second and the se
OF12	Wildlife Access	Draw a circle of radius of 5 km from the center of the AA. If mammats and amphibians can move from the center of the AA to ALL other separate wetlands and ponds located within the circle without being forced to cross pavement (any width), lawns, bare ground, and/or marine waters, mark 1= yes can move to all, 0= no. Change toblank if there are no other wetlands within 5 km.	0	In NB, enable the Wellands layer in GeoNB (despite its omissions) to show surrounding wellands an roads, while estimating the location of the 5 km circle (or draw the 5 km circle in Google Earth Pro using the Circle tool and compare). Evaluate using Google Earth, being cautious to search for roads hidden under forest canopy. [AM, SBM, STR]
OF13	Distance to Ponded	The distance from the AA center to the closest (but separate) ponded water body visible in GoogleEarth imagery is:		In Google Earth, zoom in closely to examine the surrounding landscape for ponds, lakes, and
01 10	Water			wetlands that appear to be permanently flooded. Enable the GeoNB viewer's Wetlands layer as well
		<50 m, and not separated by any width of paved roads, stretches of open water, row crops, lawn, bare ground, or impervious surface.	0	[AM, PH, SBM, Sens, WBF, WBN]
		<50 m, but completely separated by those features.	0	1
		50-500 m, and not separated.	0	1
		50-500 m, but separated by those features.	0	
		0.5 - 1 km, and not separated.	0	1
		0.5 - 1 km, but separated by those features.	0	
		None of the above (the closest patches or corridors that large are >1 km away).	1	
OF14	Distance to Large	The distance from the AA center to the closest (but separate)non-tidal body of water that is ponded during most of the year and islarger		Determine this by viewing aerial imagery in Google Earth. [Sens, WBF, WBN]
	Ponded Water	than 8 hectares during most of a normal year is:		
		<100 m.	0	
		100 m - 1 km.	0	
		1 -2 km.	1	
		2-5 km.	0]
		5-10 km.	0]
		>10 km.	0	
OF15	Tidal Proximity	The distance from the AA edge to the closesttidal water body (regardless of its salinity) is:		In Google Earth, measure the distance to the ocean (including Bay of Fundy) or tidal river, whichever
		<100 m.	0	is closer. If you need to see how far upriver a river is tidal, see the KMZ file provided with this calculator for NB (NB Headtide). Points shown in those files are only an approximation, so local
		100 m - 1 km.	0	information if available may be preferable. [FA, WBF]
		1 - 5 km.	1	1
		5-10 km.	0	
		10-40 km.	0	1
		>40 km.	0	1
OF16	Upland Edge Contact	Select one:		[NR, SBM, Sens]
		The AA has no upland edge (or upland is <1% of perimeter). The AA is entirely surrounded by (& contiguous with) other wetlands or water	r. 0	
		1-25% of the AA's perimeter abuts upland (including filled areas). The rest adjoins other wetlands or water that is mostly wider than the A-	A 0	
		25-50% of the AA's perimeter abuts upland. The rest adjoins other wetlands or water that is mostly wider than the AA. 50-75% of the AA's perimeter abuts upland. The rest adjoins other wetlands or water that is mostly wider than the AA.	0	
		put-75% of the AA's perimeter abust upland. The test adjuins other wellands of water that is mostly wider than the AA. More than 75% of the AA's perimeter abust upland. Any remainder adjoins other wellands or water that is mostly wider than the AA.This will be true for most assessments done with WESP-AC.	1	
OF17	Flood Damage from Non-	Within 5 km downstream or downslope of the AA (select first true choice):		In the GeoNB map viewer: click on "More" in upper right, then "Flood Information". Expand the menu
	tidal Waters	Maps show Flood Zone or Flood Risk areas and there appears to be infrastructure vulnerable to river flooding not caused by tidal storm	0	under it by clicking on the arrow to its left and the slider to its right. Uncheck the first (Limits of Data) box. Where available, LiDAR imagery can provide finer elevational resolution useful for flood
		surges. Maps show Flood Zone or Flood Risk areas, but infrastructure is absent or is not vulnerable to floods from a non-tidal river. In some case	s 0	modeling. [WSv]
		levees, upriver dams, or other measures may partly limit damage or risk from smaller events. Maps do not show Flood Zone or Flood Risk areas (or no such mapping has been done locally) and there appears to be infrastructure	0	1
		vulnerable to river flooding unrelated to tidal storm surges. Maps do not show Flood Zone or Flood Risk areas (or no such mapping has been done locally) and there i no infrastructure vulnerable	1	
OF18	Relative Elevation in Watershed	to river flooding unrelated to tidal storm surges. In Google Earth, enable the Terrain layer (lower left menu) and open the NB_Watersheds KMZ file that accompanies this calculator. Ther determine the AA's approximate elevation (bottom right, NOT the "eye alt"). Then move cursor around to determine the watershed's		[FA, NR, Sens, SFSv, WCv, WSv]
		and the second and th		
OF19	Water Quality Sensitive	maximum and minimum elevation. Divide the AA's elevation by the (max-min). In Goorde Farth, open the KM7 file NB, Watershed Protected Area which accompanies this calculator. The AA is within such an area.	0.2	If an ACCDC report is available for this AA, it also may contain such information. [NRv]
	Water Quality Sensitive Watershed or Area	In Google Earth, open the KMZ file NB_Watershed Protected Area which accompanies this calculator. The AA is within such an area. Enter 1= yes, 0= no.	0.2	If an ACCDC report is available for this AA, it also may contain such information. 		information if available.		charitable conservation land trusts, DUC, TNC. [PU, STR]
		New timber harvest, roads, mineral extraction, and intensive summer recreation (e.g., off-road vehicles) are permanently prohibited.	0	
		Includes many publicly-owned Protected Lands, and private lands under long-term (30+ year) legal agreements to maintain nearly-unalter	4	
		conditions.	<u></u>	
		Ownership is public (e.g., municipal, Crown Reservations/Notations) but some or all of the above activities are allowed.	1	
		Ownership is private but public access is allowed, and/or a shorter-term conservation easement (whether renewable or not) is in place.	0	
		Ownership is private and owner does not allow access, or access permission unknown, and not a conservation easement.	0	1

Date: 31 July 2020 Site Identifier: PLE-W-10 Investigator: Derrick Mitch

Form F (Field). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Walk for no less than 10 minutes from the wetland edge towards its core, in the part of the AA that is proposed for alteration. If no alteration is proposed, walk in a portion that appears to be most representative of the wetland overall. Walk only where it is safe and legal to do so. Conduct the assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answer these questions primarily based on your onsite observations and interpretations. Do not write in shaded parts of this data form. Answering some questions accurately may require conferring with the landowner or other knowledgable persons and/or reviewing aerial imagery. For most wetlands, completing this field data form will require 1-2 hours on a site. For a list of functions to which each question pertains, see the accompanying Interpretations form. For detailed descriptions of each WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage & Delay, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity, STR= Stressors.

	to die	Condition of the	D. I	Definition / C. L. V.
#	Indicators	Condition Choices	Data	Definitions/Explanations
1	Wetland Type	Follow the key below and mark the ONE row that best describes MOST of the vegetated part of the AA:		Ericaceous shrubs are ones in the heather family (Ericaceae). Most have leathery evergreen leaves. They include rhododendron, azalea, swamp laurel, leatherleaf, Labrador tea, and others. Most require
		A. Moss and/or lichen cover more than 25% of the ground. Often dominated by ericaceous shrubs (e.g., Labrador tea) or other acid-tolerant plants (e.g., bog cranberry, pitcher plant, sundew, orchids). Substrate is mostly undecomposed peat. Choose between A1 and A2 and mark the choice with a 1 in their adjoining column. Otherwise go to B below.		acidic soil. Although not in the family Ericaceae, sweetgale (<i>Myrica gale</i>) should be counted also. [AM, CS, FA, FR, INV, NR, OE, PH, Sens, SFS, WBF, WBN]
		A1. Surface water is usually absent or, if present, pH is typically <4.5 and conductivity is usually <100 µS/cm (<64 ppm TDS). Trees are absent or nearly so. Sedge cover usually sparse or absent but cottongrass and/or lichen cover may be extensive, as well as cloudberry, lingonberry, sheep laurel, and a sedge (Carex rariflora). Weltland surface and surrounding landscape are seldom sloping and weltland often is domed (convex). Inlet and outlet channels are usually absent. If known, pH of peat is <4.0.	0	
		A2. Not A1. Surface water, if present, has pH typically >4.5 and conductivity is usually >100 µS/cm (>64 ppm TDS). Sedge cover is usually extensive, and/or free and tall shrub cover is extensive. Sometimes at toe of slope or edge of water body. An exit channel is usually present. Wetter than A1 and peat depth may be shallower (<2 m).	0	
		B. Moss and/or lichen cover less than 25% of the ground. Soil is mineral or decomposed organic (muck). Choose between B1 and B2 and mark the choice with a 1 in their adjoining column:		
		B1. Trees and shrubs taller than 1 m comprise more than 25% of the vegetated cover. Surface water is mostly absent or inundates the vegetation only seasonally (e.g., vernal pools or floodplain).	1	
		B2. Not B1. Tree & tall shrubs comprise less than than 25% of the vegetated cover. Vegetation is mostly herbaceous, e.g., cattail, bulrush, burreed, pond lily, horsetail. Surface water may be extensive and fluctuates seasonally, being either persistent or drying up partly or entirely.	0	
IA sh ncludi adja lescri	ould also include part of a e the open water part adj cent " is used synonymo bed features along their a	he AA should include all persistent waters in ponds smaller than 8 hectares (-283 m on a side) that are adjacent to the AA. The the water area of adjacent ponded water larger than 8 ha and adjacent rivers wider than 20 m. Specifically, the AA should iacent to wetland vegetation and equal in width to the average width of that vegetated zone. Throughout this data form, usly with abutting, adjoining, bordering, contiguous and means no upland (manmade or natural) completely separates the directly shared edge. Features joined only by a channel are not necessarily considered to be adjacent a large portion of their es do not have to be hydrologically connected in order to be considered adjacent.		
2	Wetland Types - Adjoining or Subordinate	If the AA is smaller than 1 ha, mark all other types that occupy more than 1% of the vegetated AA. If the AA is larger than 1 ha, mark all other types which are within or adjacent to the AA and occupy more than 1 ha, as visible from the AA or as interpreted from aerial imagery. Do not mark again the type marked in F1.		1 hectare is 10,000 sq. m or about 2.5 acres. It could have dimensions of 100 m by 100 m, 1000 m by 10 m, or similar. [AM, INV, SBM, WBF]
		A1. A2.	0	
		B1.	0	
		B2.	- 1	
3	Woody Height & Form Diversity	Following EACH row below, indicate with a number code the percentage of the living vegetation in the AA which is occupied by that feature (6 if >95%, 5 if 175-95%, 4 if 50-75%, 3 if 25-50%, 2 if 5-25%, 1 if <5%, 0 if none). If the vegetated part of the AA is largely herbaceous (non-woody) vegetation, these percentages should not sum to 100%.		Deciduous shrubs in this region usually include buttonbush, Labrador tea, bayberry (Morella), huckleberry, cranberry, cloudberry, sweetgale, alder, willow, birch, ash, dogwood, and a few others. If you assigned a code of 3 or higher to any of the first four choices and the ground cover beneath the trees/shrubs is <25% moss, then question F1 might be "B1". [CS, NV, NR, PH, POL, SBM, Sens]
		coniferous trees (may include tamarack) taller than 3 m. deciduous trees taller than 3 m.	4	• • • • • • • • • • • • • • • • • • • •
		coniferous or ericaceous shrubs or trees 1-3 m tall not directly below the canopy of trees.	2	
		deciduous shrubs or trees 1-3 m tall not directly below the canopy of trees. coniferous or ericaceous shrubs <1 m tall not directly below the canopy of taller vegetation.	2	
		deciduous shrubs or trees <1 m tall (e.g., deciduous seedlings) not directly below the canopy of taller vegetation.	2	
lote :	If none of top 4 rows in	F3 was marked 2 or greater , SKIP to F9 (N fixers).		
4	Dominance of Most Abundant Shrub	Determine which two woody plant species comprise the greatest portion of the low (<3 m) woody cover . Then choose one:		[PH, POL, SBM, Sens]
	Species	those species together comprise > 50% of such cover. those species together do not comprise > 50% of such cover.	0	
5	Woody Diameter Classes	Mark ALL the types that comprise >5% of the woody canopy cover in the AA or >5% of the wooded areas (if any) along its upland edge (perimeter). The edge should include only the frees whose canopies extend into the AA.		Estimate the diameters at chest height. If small-diameter trees are overtopped (shaded) by larger ones, visualise a "subcanopy" at the average height of the smaller-dbh trees, to serve as a basis for t
		coniferous, 1-9 cm diameter and >1 m tall.	1	minimum 5% canopy requirement in this question. The trees and shrubs need not be wetland species [AM, CS, POL, SBM, Sens, WBN]
		broad-leaved deciduous 1-9 cm diameter and >1 m tall. coniferous, 10-19 cm diameter.	1	, , , , , , , , , , ,

FieldF form - Non-tidal Page 3 of 5

F37	Interspersion of	During most of the part of the growing season when water is present, the spatial pattern of emergent vegetation within the water is mostly:		[AM, FA, FR, INV, NR, OE, PH, PR, SBM, SR, WBF, WBN]
	Emergents & Open Water	Scattered. More than 30% of such vegetation forms small islands or corridors surrounded by water.	0	
	water	Intermediate.	0	
		Clumped. More than 70% of such vegetation is in bands along the wetland perimeter or is clumped at one or a few sides of the surface water area.	0	
F38	Persistent Deepwater	If the deepest patch of surface water (flowing or ponded) in or directly adjacent to the AA is mostly deeper than 0.5 m for >2 weeks during the growing season, enter "1" and continue. If not, enter "0" and SKIP to F42 (Connection).	0	
F39	Area Non-vegetated Aquatic	During most of the growing season and in waters deeper than 0.5 m, the cover for fish, aquatic invertebrates, and/or amphibians that is		For this question, consider only the wood that is at or above the water surface. Estimates of underwater
	Cover	provided NOT by living vegetation, but by accumulations of dead wood and undercut banks is:		wood based only on observations from terrestrial viewpoints are unreliable so should not be attempted. [AM, FA, FR, INV]
		Little or none. Intermediate.	0	[AW, FA, FK, 11VV]
		Extensive.	0	
F40	Isolated Island	The AA contains (or is part of) an island or beaver lodge within a lake, pond, or river, and is isolated from the shore by water depths > 1 m on all sides during an average June. The island may be solid, or it may be a floating vegetation mat that is sufficiently large and dense to support a waterbird nest.	0	[WBN]
F41	Duckweed	At some time of the year, mats of algae and/or duckweed are likely to cover >50% of the AA's otherwise-unshaded water surface, or blanket >50% of the underwater substrate. If true, enter "1" in next column. If untrue or uncertain, enter "0".	0	[EC, PR, WBF]
F42	Channel Connection & Outflow Duration	The most persistent surface water connection (outlet channel or pipe, ditch, or overbank water exchange) between the AA and a downslope stream network is: [Note: If the AA represents only part of a welland, answer this according to whichever is the least permanent surface connection: the one between the AA and the rest of the wetland, or the surface connection between the wetland and the downslope stream network.] Persistent (surface water flows out for >9 months/year).	0	Consider the connection regardless of whether the surface water is frozen. The "downslope stream network" could consist of ditches, rivers, ponds, or lakes which eventually connect to the ocean. If this cannot be determined while visiting the AA, consult topographic maps perhaps by viewing these online with Toporama (http://atlas.nrcan.gc.ca/toporama/en/index.html) [CS, FA, FR, NR, OE, PR, Sens, SFS SR, WCv, WS]
		Seasonal (surface water flows out for 14 days to 9 months/year, not necessarily consecutive).	1	
		Temporary (surface water flows out for <14 days, not necessarily consecutive). None but maps show a stream network downslope from the AA and within a distance that is less than the AA's length. SKIP to F47 (pH	0	
		Measurement).		
		No surface water flows out of the wetland except possibly during extreme events (-once per 10 years). Or, water flows only into a wetland, ditch, or lake that lacks an outlet. SKIP to F47 (pH Measurement).	0	
F43	Outflow Confinement	During major runoff events, in the places where surface water exits the AA or connected waters nearby, the water:		"Major runoff events" would include biennial high water caused by storms and/or rapid snowmelt. [CS, NR, OE, PR, Sens, SR, STR, WS]
		Mostly passes through a pipe, culvert, narrowly breached dike, berm, beaver dam, or other partial obstruction (other than natural topography) that does not appear to drain the wetland artificially during most of the growing season.	0	
		Leaves through natural exits (channels or diffuse outflow), not mainly through artificial or temporary features.	1	
		Is exported more quickly than usual due to ditches or pipes within the AA or connected to its outlet, or within 10 m of the AA's edge, which drain the wetland artificially, or water is pumped out of the AA.	0	
F44	Tributary Channel	At least once annually, surface water from a tributary channel that is >100 m long moves into the AA. Or, surface water from a larger permanent water body adjacent to the AA spills into the AA. If it enters only via a pipe, that pipe must be fed by a mapped stream or lake further upslope. If no, SKIP to F47 (pH Measurement).	0	If inlet tributaries cannot be searched for due to inaccessibility of part of the AA, follow suggestions in F42 above. [NRv, PH, PRv, SRv]
F45	Input Water Temperature	Based on lack of shade, water source characteristics, or actual temperature measurements, the inflow is likely to be warmer than surface water in the AA during part of most years. Enter 1= yes, 0= no.	0	[WCv]
F46	Throughflow	During its travel through the AA at the time of peak annual flow, water arriving in channels: [select only the ONE encountered by most of the incoming water].		[FA, FR, INV, NR, OE, PR, SR, WS]
	Resistance	Does not bump into many plant stems as it travels through the AA. Nearly all the water continues to travel in unvegetated (often incised) channels that have minimal contact with wetland vegetation, or through a zone of open water such as an instream pond or lake.	0	
		Bumps into herbaceous vegetation but mostly remains in fairly straight channels. Bumps into herbaceous vegetation and mostly spreads throughout, or is in widely meandering, multi-branched, or braided channels.	0	
		Bumps into tree trunks and/or shrub stems but mostly remains in fairly straight channels. Bumps into tree trunks and/or shrub stems and follows a fairly indirect path from entrance to exit (meandering, multi-branched, or braided).	0	
F47	pH Measurement	The pH in most of the AA's surface water:		Preferably, measure this in larger areas of ponded surface water within the AA, or in streams that have
		Was measured, and is: [enter the reading in the column to the right.]	0	passed through (not along) most of the AA. Unless surface water is completely absent, do not dig holes or make depressions in peat in order to provide water for this measurement. Avoid measuring near
		Was not measured but surface water is present and is darkly tea-coloured. Or if no surface water, then mosses and plants that indicate pealland (e.g., Labrador tea) are prevalent. Enter *11. Neither of above. Enter *11.	0	roads or in puddles formed only by recent rain. [AM, FA, FR, NR, WBF, PH, PR, Sens, WBF, WBN]
F48	TDS and/or	The TDS (total dissolved solids) or conductivity off the AA's surface water is: (select the first true row with information):		See above for measurement guidance. [FR, INV, NRv, PH, PRv, Sens]
	Conductivity	TDS is: [Enter the reading in ppm or mg/L in the column to the right, if measured, or answer next row.]		
		Conductivity is [Enter the reading in µS/cm in the column to the right.] Was not measured, but plants that indicate saline conditions cover much of the vegetated AA. Enter *1*.	0	
		Neither of above	1	
F49	Beaver Probability	Use of the AA by beaver during the past 5 years is (select most applicable ONE):		[FA, FR, PH, SBM, Sens, WBF, WBN]
		Evident from direct observation or presence of gnawed limbs, dams, tracks, dens, lodges, or extensive stands of water-killed trees (snags).	0	
		Likely based on known occurrence in the region and proximity to suitable habitat, which may include: (a) a persistent freshwater wetland, pond, or lake, or a perennial low or mid-gradient (<10%) channel, and (b) a corridor or multiple stands of hardwood trees and shrubs in vegetated areas near surface water.	0	
F50	Groundwater Strength	Unlikely because site characteristics above are deficient, and/or this is a settled area or other area where beaver are routinely removed. Select first applicable choice:	1	Adhere to these criteria strictly do not use personal judgment based on fen conditions, pH, or other
1 30	of Evidence	Series in st. applicable choice: Springs are known to be present within the AA, or if groundwater levels have been monitored, that has demonstrated that groundwater primarily discharges to the wetland for longer periods during the year than periods when the wetland recharges the groundwater.	0	Audited to these chiefla shirtly - out hot use personal puginent based of her continuors, pr., or other evidence. Consult lopographic maps to detect breaks in slope described here. Rust deposits associated with groundwater seeps may be most noticeable as orange discoloration in ice formations along streams during early winter. [AM, CS, FA, FR, INV, NR, OE, PH, PRv, SFS, WC, WS]
		Most of the AA has a slope of >5%, or is very close to the base of a natural slope longer than 100 and much steeper than the slope of the AA, AND the pH of surface water, if known, is >5.5.	0	
F51	Internal Gradient	Neither of above is true, although some groundwater may discharge to or flow through the AA. Or groundwater influx is unknown. The gradient along most of the flow path within the AA is:	1	This is not the same as the shoreline slope. It is the elevational difference between the AA's inlet and
	cma Gradietti	The gradient along most of the new part within the AA is. The AA has no surface water outlet (not even seasonally).	1	outlet, divided by the flow-distance between them and converted to percent. If available, use a
		2-5%.	0	clinometer to measure this. Free clinometer apps can be downloaded to smartphones. If the wetland is large (longer than –1 km), this may be estimated using Google Earth to determine the minimum and
		6-10%. >10%.	0	maximum elevation within the AA, then dividing by length and multiplying by 100. [CS, NR, OE, PR, SR, WBF, WBN, WS]
		ions: If the AA lacks an upland edge, evaluate based on the AA's entire perimeter, and moving outward into whatever areas are		
adjace F52		nese questions are best answered by measuring from aerial images. Within a zone extending 30 m laterally from the AA's edge with upland and/or other wetlands, the percentage that contains perennial		[AM, FA, FR, INV, NRv, PH, POL, PRv, SBM, Sens, SRv, STR, WBN]
	of Perimeter	vegetation cover (except lawns, row crops, heavily grazed land, conifer plantations) is:		
		<5%. 5 to 30%.	0	
		30 to 60%.	0	
		60 to 90%. >90%, or all the area within 30 m of the AA edge is other wetlands. SKIP to F55.	0	
		> 70.70, or all the area within 30 m of the AM edge is offiel Welldhus. 3Nit to F33.		

FieldF form - Non-tidal Page 4 of 5

53	Type of Cover in Buffer	Within 30 m upslope of where the wetland transitions to upland, the upland land cover that is NOT perennial vegetation is mostly (mark ONE):		[AM, FA, INV, NRv, PH, POL, SBM, STR, WBN]
	Type or devel in Bullet			
		Impervious surface, e.g., paved road, parking lot, building, exposed rock.	0	
		Bare or nearly bare pervious surface or managed vegetation, e.g., lawn, row crops, unpaved road, dike, landslide.	0	
54	Buffer Slope	The steepest and/or most disturbed part of the upland area that is within 30 m of the wetland and occupies >10% of that upland area has a percent slope of:		[NRv, PRv, Sens, SRv]
		<1% (flat almost no noticeable slope) or all the area within 30 m of the AA edge is other wetlands.	0	
		2-5%.	0	
		5-30%. >30%.	0	4
55	Cliffs or Steep Banks	>30%. In the AA or within 100 m, there are elevated terrestrial features such as cliffs, talus slopes, stream banks, or excavated pits (but not riprap)	0	Do not include upturned trees as potential den sites. [POL, SBM]
33	Cilis of Steep Baliks	In the zero of within 1 on, interest are expensed terrestation realized such as callos, made suppes, suream datas, or excervated pais Qualiform propy that extend at least 2 m nearly vertically, are unvegetated, and potentially contain crevices or other substrate suitable for nesting or den areas. Enter 1 (yes) or 0 (no).	0	DO NOI INCIDURE UPERS AS POTENTIAL DEL SILES. [F.O.L., DUM]
56	New or Expanded Wetland	Human actions within or adjacent to the AA have persistently expanded a naturally occurring wetland or created a wetland where there previously was none (e.g., by excavation, impoundment):		Determine this using historical aerial photography, old maps, soil maps, or permit files as available [C NR, OE, PH, Sens]
		No.	1	
		Yes, and created or expanded 20 - 100 years ago.	0	
		Yes, and created or expanded 3-20 years ago.		4
		Yes, and created or expanded within last 3 years.	0	-
		Yes, but time of origin or expansion unknown. Unknown if new or expanded within 20 years or not.	0	-
57	Burn History	More than 1% of the AA's previously vegetated area:	0	Look for charred soil or stumps (in multiple widely-spaced locations) or ask landowner. [CS, PH, STR]
	Durit History			2 South of Statings (in manages makey Spacea totalions) of ask tandomici. [63, FH, STK
		Burned within past 5 years.	0	4
		Burned 6-10 years ago.	0	4
		Burned 11-30 years ago.	0	
		Burned >30 years ago, or no evidence of a burn and no data.	1	(DLI CTD WOE)
58	Visibility	The maximum percentage of the welland that is visible from the best vantage point on public roads, public parking lots, public buildings, or public maintained trails that intersect, adjoin, or are within 100 m of the AA (select one) is:		[PU, STR, WBFv]
		<25%.		
		25·50%. >50%.	0	4
59	Non-consumptive	Assuming access permission was granted, select ALL statements that are true of the AA as it currently exists:	Ü	[PU, STR]
J7	Uses - Actual or			[10, 310]
	Potential	For an average person, walking is physically possible <u>in</u> (not just near) >5% of the AA during most of the growing season, e.g., free of deep water and dense shrub thickets.	1	
		Maintained roads, parking areas, or foot-traits are within 10 m of the AA, or the AA can be accessed part of the year by boats arriving via contiquous waters.	0	
		Within or near the AA, there is an interpretive center, trails with interpretive signs or brochures, and/or regular guided interpretive tours.	0	
60	Unvisited Core Area	The percentage of the AA almost never visited by humans during an average growing season probably comprises: [Note: Only include the part actually walked or driven (find simply viewed from) with a vehicle or boat. Do not include visitors on traits outside of the AA unless more than half the welfand is visible from the traits and they are within 30 m of the welfand edge. In that case include only the accupied by the		[AM, FAv, FRv, PH, PU, SBM, STR, WBF, WBN]
		trail.]

Other human-related disturbances within the CA.	Other human-related disturbances within the CA.							
If any items were checked above, then for each row of the table below, assign points (3, 2, or 1 as shown in header) in the last column. However, if you believe the checked items did not cumulatively add significantly more sediment or suspended solids to the AA, then leave the "D's" for the scores in the following rows. To estimate effects, contrast the current condition with the condition if the checked items never occurred or were no longer present.								
	Severe (3 points)	Medium (2 points)	Mild (1 point)					
Erosion in CA:	Extensive evidence, high intensity.*	Potentially (based on high-intensity* land use) or scattered evidence.	Potentially (based on low-intensity* land use) with little or no direct evidence.					
Recentness of significant soil disturbance in the CA:	Current & ongoing.	1-12 months ago.	>1 yr ago.					
Duration of sediment inputs to the wetland:	Frequent and year-round.	Frequent but mostly seasonal.	Infrequent & during high runoff events mainly.					
AA proximity to actual or potential sources:	0 - 15 m.	15-100 m.	In more distant part of contributing area.					
* high-intensity= extensive off-road vehicle use, plowing, grading,	excavation, erosion with or without veg removal; $\textbf{low}\text{-}\text{intensity}\text{=}\text{veg}$	removal only with little or no apparent erosion or disturbance of	Sum=	0

FieldS form Non-tidal 2

Assessment Area (AA) Results:

Wetland ID: PLE-W-10

Date: 31 July 2020

Observer: Derrick Mitchell

Latitude & Longitude (decimal degrees): 45.176867, -66.195094

Scores will appear below after data are entered in worksheets OF, F, and S. See Manual for definitions and descriptions of how scores were computed.

an opening						
Wetland Functions or Other Attributes:	Function Score (Normalised)	Function Rating	Benefits Score (Normalised)	Benefits Rating	Function Score (raw)	Benefits Score (raw)
Water Storage & Delay (WS)	5.68	Higher	0.00	Lower	6.10	0.00
Stream Flow Support (SFS)	3.13	Moderate	1.62	Lower	1.67	0.94
Water Cooling (WC)	0.00	Lower	0.00	Lower	0.00	0.00
Sediment Retention & Stabilisation (SR)	7.56	Higher	0.37	Lower	8.33	0.22
Phosphorus Retention (PR)	5.71	Higher	0.00	Lower	6.95	0.33
Nitrate Removal & Retention (NR)	2.25	Lower	1.56	Lower	5.22	2.50
Carbon Sequestration (CS)	8.49	Higher			8.22	
Organic Nutrient Export (OE)	5.58	Higher			5.29	
Anadromous Fish Habitat (FA)	0.00	Lower	0.00	Lower	0.00	0.00
Resident Fish Habitat (FR)	0.00	Lower	0.00	Lower	0.00	0.00
Aquatic Invertebrate Habitat (INV)	5.09	Moderate	0.79	Lower	5.66	1.67
Amphibian & Turtle Habitat (AM)	2.12	Lower	5.13	Moderate	4.42	5.20
Waterbird Feeding Habitat (WBF)	0.00	Lower	0.00	Lower	0.00	0.00
Waterbird Nesting Habitat (WBN)	0.00	Lower	0.00	Lower	0.00	0.00
Songbird, Raptor, & Mammal Habitat (SBM)	6.77	Moderate	10.00	Higher	5.61	10.00
Pollinator Habitat (POL)	8.92	Higher	6.67	Moderate	7.19	6.67
Native Plant Habitat (PH)	8.16	Higher	7.48	Higher	6.38	6.49
Public Use & Recognition (PU)			2.07	Lower		1.80
Wetland Sensitivity (Sens)			1.54	Lower		2.67
Wetland Ecological Condition (EC)			7.83	Higher		8.75
Wetland Stressors (STR) (higher score means more stress)			0.22	Lower		2.34
Summary Ratings for Grouped Functions:						
HYDROLOGIC Group (WS)	3.13	Moderate	0.00	Lower	6.10	0.00
WATER QUALITY SUPPORT Group (max+avg/2 of SR, PR, NR, CS)	6.37	Higher	1.10	Lower	7.76	1.76
AQUATIC SUPPORT Group (max+avg/2 of SFS, INV, OE, WC)	4.52	Moderate	1.21	Lower	4.41	1.27
AQUATIC HABITAT Group (max+avg/2 of FA, FR, AM, WBF, WBN)	1.27	Lower	3.08	Lower	2.65	3.12
TRANSITION HABITAT Group (max+avg/2 of SBM, PH, POL)	8.44	Higher	9.02	Higher	6.79	8.86
WETLAND CONDITION (EC)			7.83	Higher		8.75
WETLAND RISK (average of Sensitivity & Stressors)			0.88	Lower		2.50
	NOTE: A scor	e of 0 does not	mean the func	tion or benefit i	s absent from t	he wetland It

NOTE: A score of 0 does not mean the function or benefit is absent from the wetland. It means only that this wetland has a capacity that is equal or less than the lowest-scoring one, for that function or benefit, from among the 98 NB calibration wetlands that were assessed previously.

Cover Page: Basic Description of Assessment	WESP-AC version 2
Site Name:	Burchill Wind Energy Project - PLE-W-11
Investigator Name:	Derrick Mitchell
Date of Field Assessment:	31 July 2020
Nearest Town:	Lorneville (west Saint John), New Brunswick
Latitude (decimal degrees):	45.179169
Longitude (decimal degrees):	-66.197518
Is a map based on a formal on-site wetland delineation available?	Yes
Approximate size of the Assessment Area (AA, in hectares):	4.50
AA as percent of entire wetland (approx.). Attach sketch map if AA is smaller than the entire contiguous wetland.	
What percent (approx.) of the wetland were you able to visit?	100
What percent (approx.) of the AA were you able to visit?	100
Were you able to ask the site owner/manager about any of the questions?	No
Indicate here if you intentionally surveyed for rare plants, calciphile plants, or rare animals	Yes
Have you attended a WESP-AC training session? If so, indicate approximate month & year	Yes, September 2016
How many wetlands have you assessed previously using WESP-AC? (approx.)	100+
Comments about the site or this WESP-AC assessment (attach extra page if desired):	

Form OF (Office). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Conduct an assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the Q (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answering many of the questions below will equire using these online map viewers:

Google Earth Pro: https://www.google.com/earth/download/gep/agree.html
GeoNB: http://www.snb.ca/geonb1/ and http://www.snb.ca/geonb1/e/apps/apps-E.asp

Geomb. http://www.sinu.ca/geomb./ and http://www.sinu.ca/geomb./ geomb./ geomb Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity,

#	Indicators	Condition Choices	Data	Definitions/Explanations
OF1	Province	Mark the province in which the AA is located by changing the 0 in the column next to it to a "1". Mark only one.		This determines to which province's calibration wetlands the raw score of any wetland is normalised.
		New Brunswick	- 1	In the function and benefits models, it also triggers the automatic exclusion of indicators for which no spatial data exists in a particular province.
		Nova Scotia	0	openia dala onoso in a pantada province.
		Prince Edward Island	0	
		Newfoundland-Labrador	0	
OF2	Ponded Area Within 1 km.	The area of surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) within 1 km is:		"Adjacent" means not separated from the AA by a wide expanse (>50 m) of upland (including roads >50 m wide). Include ponded areas likely to be hidden by wetland vegetation. If surface water
		<0.01 hectare (about 10 m x 10 m).	0	extends beyond 1 km, include only the part within 1 km. Do not include tidal areas. Measure the area
		0.01 - 0.1 hectare.	0	from aerial imagery using Google Earth Pro (click on Ruler icon in toolbar, then Polygon in pop-up menu). With the GeoNB viewer, enable the Wetlands layer, then measure with the Draw & Measure
		0.1 - 1 hectare.	0	tool after specifying Aerial as the Basemap. However, do not rely entirely on wetland boundaries
		1 to 10 hectares.	1	shown in online wetlands layers. [PH, SBM, WBN]
		10 to 100 hectares.	0	
		>100 hectares.	0	
OF3	Ponded Water & Wetland Within 1 km.	The area of wetlands and surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) within 1 km is:		See definition of adjacent in OF2. If the AA's wetland vegetation extends beyond 1 km, include only the part within 1 km. "Ponded" means not flowing in rivers or streams. [Sens, WBF]
		<0.01 hectare (about 10 m x 10 m).	0	
		0.01 - 0.1 hectare.	0	
		0.1 - 1 hectare.	0	
		1 to 10 hectares.	1	
		10 to 100 hectares.	0	1
OF4	Size of Largest Nearby	>100 hectares. The largest vegetated patch or corridor that includes the AA's vegetation plus all adjacent upland vegetation that is not lawn, row crops,	U	See definition of adjacent in OF2. Use Google Earth Pro's polygon ruler (as described above).
UF4	Vegetated Tract or Corridor	heavily grazed lands, conifer plantation is:		Exclude conifer plantations only if it is obvious that trees were planted in rows. [AM, PH, SBM, Sens]
	Comaci	<0.01 hectare (about 10 m x 10 m).	0	
		0.01 - 0.1 hectare.	0	
		0.1 - 1 hectare.	0	-
		1 to 10 hectares. 10 to 100 hectares.	0	-
		100 to 1000 hectares.	0	-
		>1000 hectares. [This is nearly always the answer in relatively undeveloped landscapes.]	1	
OF5	Distance to Large	The minimum distance from the edge of the AA to the edge of the closest <i>vegetated land</i> (but excluding row crops, lawn, conifer		To measure distance, use Google Earth Pro (Ruler > Line tool). Or use Draw & Measure tool at
	Vegetated Tract	plantation) larger than 375 hectares (about 2 km on a side), is:		GeoNB. The 375-ha criterion is from the Fundy Model Forest Project. [AM, PH, POL, SBM, Sens]
	J	<50 m, and not separated from the 375-ha vegetated area by any width of paved roads, stretches of open water, row crops, bare ground, lawn, or impervious surface. Or the AA itself contains >375 ha of vegetation. [This is often the answer in relatively undeveloped landscapes.]	1	
		<50 m, but completely separated from the 375-ha vegetated area by those features, and AA does not contain >375 ha of vegetation.	0	
		50-500 m, and not separated.	0	
		50-500 m, but separated by those features.	0	1
		0.5 - 5 km, and not separated.	0	
		0.5 - 5 km, but separated by those features.	0	
		None of the above (the closest patches or corridors which are that large are >5 km away).	0	
OF6	Herbaceous Uniqueness	The AA's vegetation cover is >10% herbaceous* but uplands within 5 km have <10% herbaceous cover. If so, enter "3" and continue to OF7. If not, consider: The AA's vegetation cover is >10% herbaceous but uplands within 1 km have <10% herbaceous cover. If so enter "2" and continue to OF7. If not, consider: The AA's vegetation cover is >10% herbaceous* but uplands within 100 m of the wetland edge have <10% herbaceous cover. If so, enter "1". If NOTE: Exclude lawns, row crops, heavily grazed lands, forest, shrublands. Include moss as well as grasslike plants in this use of "herbaceous vegetation"]		For this question only, consider moss to be herbaceous vegetation. Determine the score by viewing areal imagery in Google Earth after successively drawing or estimating the boundaries of the buffers of 5 km, 1 km, and 100 m radius focused on the center of the AA. Circles of specified radius can be drawn in Google Earth Pro by clicking on the Ruler icon, then Circle in the pop-up menu. [AMw, PHv, POLv, SBMv, WBFv, WBNv]
OF7	Woody Uniqueness	The AA's vegetation cover is >10% woody* but uplands within 5 km have <10% woody cover. If so, enter "3" and continue to OF8. If not,	2	See above. Do not consider conifer plantations to be forest if it is obvious that trees were planted in
		consider: The AA's pagetation is a 100's pagets' but unloads within 1 km have a 100's pagets gaves. If so enter "2" and continue to OFR. If not		rows. [AMv, PHv, POLv, SBMv]
		The AA's vegetation is >10% woody* but uplands within 1 km have <10% woody cover. If so enter *2" and continue to OF8. If not, consider:		
		The ANs vegetation is >10% woody* but uplands within 100 m of the wetland edge have <10% woody cover. If so, enter "1" [* NOTE: woody cover = trees & shrubs taller than 1 m.]		
OF8	Local Vegetated Cover	Draw a 5-km radius circle measured from the center of the AA. Ignoring all permanent water in the circle, the percent of the remaining area		In Google Earth, draw the 5 km buffer and then estimate land cover percentages, or do GIS analysis
	Percentage	that is wooded or unmanaged herbaceous vegetation (NOT lawn, row crops, bare or heavily grazed land, clearcuts, or conifer plantations) is:		of an appropriate land cover layer. [AM, PH, POL, SBM, Sens]
		<5% of the land.	0	
		5 to 20% of the land.	0]
		20 to 60% of the land.	0	
		60 to 90% of the land.	0	
		>90% of the land. SKIP to OF10.	1	
OF9	Type of Land Cover	Within the 5-km radius circle, and ignoring all permanent water, the land area that is bare or non-perennial cover is mostly:		[AM, SBM]
	Alteration	Impervious surface, e.g., paved road, parking lot, building, exposed rock.	0	
		Bare pervious surface, e.g., lawn, recent (<5 yrs ago) clearcut, dirt or gravel road, cropland, landslide, conifer plantation.	0	
OF10	Distance by Road to	Measured along the maintained road nearest the AA, the distance to the nearest population center is:		"Population center" means a settled area with more than about 5 regularly- inhabited structures per
	Nearest Population	<100 m.	0	square kilometer. In Google Earth, click on the Ruler icon, then Path, and draw and measure the
	Center	100 - 500 m.	0	route. Or use the GeoNB's Draw & Measure tool> Freehand Line to draw and measure the route to Settlements (click on Place Names in menu) or other areas not close to mapped settlements but
		0.5- 1 km.	0	which meet the criteria.[FAv, FRv, NRv, PH, PU, SBM, WBFv]
		1 - 5 km.	- 1	1
		>5 km.	0	1
			-	

OF11	Distance to Nearest From the center of the AA, the distance to the nearest maintained public road (dirt or paved) is:			Determine this by viewing aerial imagery in Google Earth and measuring with the Ruler>Line tool. Or
	Maintained Road	<10 m.	0	use the GeoNB's Draw Line tool. [AM, FAv, FRv, NRv, PH, PU, SBM, STR, WBN]
		10 - 25 m.	0	
		25 - 50 m.	0	
		50 - 100 m.	0	
		100 - 500 m. >500 m.	0	
OF12	Wildlife Access	Draw a circle of radius of 5 km from the center of the AA. If mammals and amphibians can move from the center of the AA to ALL other	U	In NB, enable the Wetlands layer in GeoNB (despite its omissions) to show surrounding wetlands and
		separate wetlands and ponds located within the circle without being forced to cross pavement (any width), lawns, bare ground, and/or marine waters, mark 1= yes can move to all, 0= no. Change to blank if there are no other wetlands within 5 km.	0	roads, while estimating the location of the 5 km circle (or draw the 5 km circle in Google Earth Pro using the Circle tool and compare). Evaluate using Google Earth, being cautious to search for roads hidden under forest canopy. [AM, SBM, STR]
OF13	Distance to Ponded	The distance from the AA center to the closest (but separate) ponded water body visible in GoogleEarth imagery is:		In Google Earth, zoom in closely to examine the surrounding landscape for ponds, lakes, and
	Water	<50 m, and not separated by any width of paved roads, stretches of open water, row crops, lawn, bare ground, or impervious surface.	0	wellands that appear to be permanently flooded. Enable the GeoNB viewer's Wetlands layer as well. [AM, PH, SBM, Sens, WBF, WBN]
		<50 m, but completely separated by those features. 50-500 m, and not separated.	0	
		50-500 m, and not separated. 50-500 m, but separated by those features.	0	
		0.5 - 1 km, and not separated.	0	
		0.5 - 1 km, but separated by those features.	0	
0014	Distance to Large	None of the above (the closest patches or corridors that large are >1 km away).	1	Determine this beginning and brown in Courts Forth (Court MDE MDN)
OF14	Distance to Large Ponded Water	The distance from the AA center to the closest (but separate) non-tidal body of water that is ponded during most of the year and is larger than 8 hectares during most of a normal year is: 100 m.	0	Determine this by viewing aerial imagery in Google Earth. [Sens, WBF, WBN]
		100 m - 1 km.	0	
		1 - 2 km.	1	
		2-5 km.	0	
		5-10 km.	0	1
OF15	Tidal Proximity	>10 km. The distance from the AA edge to the closest tidal water body (regardless of its salinity) is:	0	In Google Earth, measure the distance to the ocean (including Bay of Fundy) or tidal river, whichever
5. 15		The distance norm the AA edge to the crosest roan water body (regardless on its salinity) is. <100 m.	0	is closer. If you need to see how far upriver a river is tidal, see the KMZ file provided with this
		100 m · 1 km.	0	calculator for NB (NB Headtide). Points shown in those files are only an approximation, so local information if available may be preferable. [FA, WBF]
		1 - 5 km.	1	вния палот в ачавале тау не ргетегане. [г А, чтог]
		5-10 km.	0	
		10-40 km.	0	
051/	Haland Edna Contact	>40 km.	0	[NR. SBM. Sens]
UF 16	Upland Edge Contact	Select one: The AA has no upland edge (or upland is <1% of perimeter). The AA is entirely surrounded by (& contiguous with) other wetlands or water.	0	[NK, SBM, Selts]
		1-25% of the AA's perimeter abuts upland (including filled areas). The rest adjoins other wetlands or water that is mostly wider than the AA.	0	
		25-50% of the AA's perimeter abuts upland. The rest adjoins other wetlands or water that is mostly wider than the AA.	0	
		50-75% of the AA's perimeter abuts upland. The rest adjoins other wetlands or water that is mostly wider than the AA.	0	
		More than 75% of the AA's perimeter abuts upland. Any remainder adjoins other wetlands or water that is mostly wider than the AA. This will be true for most assessments done with WESP-AC.	1	
OF17	Flood Damage from Non- tidal Waters	Within 5 km downstream or downslope of the AA (select first true choice):		In the GeoNB map viewer: click on "More" in upper right, then "Flood Information". Expand the menu under it by clicking on the arrow to its left and the slider to its right. Uncheck the first (Limits of Data)
	tidal Waters	Maps show Flood Zone or Flood Risk areas and there appears to be infrastructure vulnerable to river flooding not caused by tidal storm surges.	0	box. Where available, LIDAR imagery can provide finer elevational resolution useful for flood modeling. (WSv)
		Maps show Flood Zone or Flood Risk areas, but infrastructure is absent or is not vulnerable to floods from a non-tidal river. In some cases levees, upriver dams, or other measures may partly limit damage or risk from smaller events. Maps do not show Flood Zone or Flood Risk areas (or no such mapping has been done locally) and there appears to be infrastructure	0	
		vulnerable to river flooding unrelated to tidal storm surges.	Ů	
		Maps do not show Flood Zone or Flood Risk areas (or no such mapping has been done locally) and there is no infrastructure vulnerable to river flooding unrelated to tidal storm surges.	1	
OF18	Relative Elevation in Watershed	In Google Earth, enable the Terrainh saugus. In Google Earth, enabl		[FA, NR, Sens, SFSv, WCv, WSv]
OF19	Water Quality Sensitive Watershed or Area	In Google Earth, open the KMZ file NB_Watershed Protected Area which accompanies this calculator. The AA is within such an area. Enter 1= yes, 0= no.	0.2	If an ACCDC report is available for this AA, it also may contain such information. [NRv]
OF20	Degraded Water	Sampling indicates a problem with concentrations of metals, hydrocarbons, nutrients, or other substances (excluding bacteria, acidic		May use existing data, or sample those waters as part of this wetland assessment. "Harmful" should
	Upstream	water, high temperatures) being present at levels harmful to aquatic life or humans, and:	,	be evaluated with regard to current federal or provincial water quality standards. [AM, FA, FR, NRv, PRv, SRv, STR, WBF, WBN]
		The condition is present within the AA. The condition is present in waters within 1 km that flow into the AA, but has not been documented in the AA itself.	0	
		Sampling during both low water periods and times with high runoff (storms, snowmelt) indicates no problems in either the AA or inflowing	0	
		waters.		
		Data are insufficient (no or inadequate sampling within 1 km, or condition exists only at >1 km upstream). This is the situation for nearly all wetlands in this region.	1	
OF21	Degraded Water Downstream	The problem described above is downslope from the AA, and:		May use existing data, or monitor waters as part of this wetland assessment. [NRv, PRv, SRv]
		The condition is present within 1 km downslope and connected to the AA by a channel.	0	
		The condition is present within 5 km downslope and connected to the AA by a channel, or within 1 km but not connected to the AA by a channel. Sampling during both low water periods and times with high runoff (storms, snowmell) indicates no problems in either the AA or inflowing	0	
		waters. Data are insufficient (no or inadequate sampling within 1 km, or condition exists only at >1 km upstream). This is the situation for nearly	1	
		all wetlands in this region.		
OF22	Wetland as a % of Its Contributing Area (Catchment)	From a topographic map and field observations, estimate the approximate boundaries of the catchment (CA) of the entire wetland of which the AI may be only a part. Then adjust those boundaries if necessary based on your field observations of the surrounding man, and/or by using procedures described in the Manual. Divide the area of the wetland (not just the AA) by the approximate area of its catchment excluding the area of the wetland itself. When doing the calculation, if ponded water is adjacent to the wetland, include that in the wetlands area. The result its:		Topographic maps may be viewed online at the National Atlas of Canada (Toporama): http://atlas.gc.ca/toporama/en/index.html [NR, PR, Sens, SR, WS]
		< 0.01, or catchment size unknown due to stormwater pipes that collect water from an indeterminate area.	0	
		0.01 to 0.1.	0	
		0.1 to 1. >1 (wetland is larger than its catchment (e.g., wetland with flat surrounding terrain and no inlet, or is entirely isolated by dikes, or is a raised	0	
OF23	Unvegetated Surface in	The proportion of the AA's contributing area (measured to no more than 1000 m upslope) that is comprised of buildings, roads, parking lots,		[FA, INV, NRv, PRv, SRv, STR, WCv, WSv]

Form F (Field). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Walk for no less than 10 minutes from the wetland edge towards its core, in the part of the AA that is proposed for alteration. If no alteration is proposed, walk in a portion that appears to be most representative of the wetland overall. Walk only where it is safe and legal to do so. Conduct the assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answer these questions primarily based on your onsite observations and interpretations. Do not write in shaded parts of this data form. Answering some questions accurately may require conferring with the landowner or other knowledgable persons and/or reviewing aerial imagery. For most wetlands, completing this field data form will require 1-2 hours on a site. For a list of functions to which each question pertains, see the accompanying Interpretations form. For detailed descriptions of each WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage & Delay, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity, STR= Stressors.

#	Indicators	Condition Choices	Data	Definitions/Explanations
F1	Wetland Type	Follow the key below and mark the ONE row that best describes MOST of the vegetated part of the AA:		Ericaceous shrubs are ones in the heather family (Ericaceae). Most have leathery evergreen leaves. They include rhododendron, azalea, swamp laurel, leatherleaf, Labrador tea, and others. Most require
		A. Moss and/or lichen cover more than 25% of the ground. Often dominated by ericaceous shrubs (e.g., Labrador tea) or other acid-tolerant plants (e.g., bog cranberry, pitcher plant, sundew, orchids). Substrate is mostly undecomposed peat. Choose between A1 and A2 and mark the choice with a 1 in their adjoining column. Otherwise go to B below.		acidic soil. Although not in the family Ericaceae, sweetgale (Myrica gale) should be counted also.
		A1. Surface water is usually absent or, if present, pH is typically <4.5 and conductivity is usually <100 µS/cm (<64 ppm TDS). Trees are absent or nearly so. Sedge cover usually sparse or absent but cottongrass and/or lichen cover may be extensive, as well as cloudberry, lingonberry, sheep laurel, and a sedge (Carex rarillora). Wetland surface and surrounding landscape are seldom sloping and wetland often is domed (convex). Inlet and outlet channels are usually absent. If known, pH of peat is <4.0.	0	
		A2. Not A1. Surface water, if present, has pH typically >4.5 and conductivity is usually >100 µS/cm (>64 ppm TDS). Sedge cover is usually extensive, and/or tree and tall shrub cover is extensive. Sometimes at loe of slope or edge of water body. An exit channel is usually present. Wetter than A1 and peat depth may be shallower (<2 m).	0	
		B. Moss and/or lichen cover less than 25% of the ground. Soil is mineral or decomposed organic (muck). Choose between B1 and B2 and mark the choice with a 1 in their adjoining column:		
		B1. Trees and shrubs taller than 1 m comprise more than 25% of the vegetated cover. Surface water is mostly absent or inundates the vegetation only seasonally (e.g., vernal pools or floodplain).	1	
		B2. Not B1. Tree & tall shrubs comprise less than than 25% of the vegetated cover. Vegetation is mostly herbaceous, e.g., catrail, bulrush, burreed, pond lily, horsetail. Surface water may be extensive and fluctuates seasonally, being either persistent or drying up partly or entirely.	0	
AA sh includ " adja descri	ould also include part of le the open water part ad cent " is used synonymo ibed features along their	the AA should include all persistent waters in ponds smaller than 8 hectares (-283 m on a side) that are adjacent to the AA. The the water area of adjacent ponded water larger than 8 ha and adjacent rivers wider than 20 m. Specifically, the AA should flacent to wetland vegetation and equal in width to the average width of that vegetated zone. Throughout this data form, usly with abutting, adjoining, bordering, contiguous and means no upland (manmade or natural) completely separates the directly shared edge. Features joined only by a channel are not necessarily considered to be adjacent a large portion of their res do not have to be hydrologically connected in order to be considered adjacent.		
F2	Wetland Types - Adjoining or Subordinate	If the AA is smaller than 1 ha, mark all other types that occupy more than 1% of the vegetated AA. If the AA is larger than 1 ha, mark all other types which are within or adjacent to the AA and occupy more than 1 ha, as visible from the AA or as interpreted from aerial imagery. Do not mark again the type marked in F1.		1 hectare is 10,000 sq. m or about 2.5 acres. It could have dimensions of 100 m by 100 m, 1000 m by 10 m, or similar. [AM, INV, SBM, WBF]
		A1. A2.	0	
		B1.	0	
-3	Woody Height & Form	B2. Following EACH row below, indicate with a number code the percentage of the living vegetation in the AA which is occupied by that feature (6	0	Deciduous shrubs in this region usually include buttonbush, Labrador tea, bayberry (Morella),
	Diversity	if >95%, 5 if 75-95%, 4 if 50-75%, 3 if 25-50%, 2 if 5-25%, 1 if <5%, 0 if none). If the vegetated part of the AA is largely herbaceous (non-woody) vegetation, these percentages should not sum to 100%. coniferous trees (may include tamarack) taller than 3 m.	2	huckleberry, cranberry, cloudberry, sweetgale, alder, willow, birch, ash, dogwood, and a few others. If you assigned a code of 3 or higher to any of the first four choices and the ground cover beneath the trees/shrubs is <25% moss, then question F1 might be "B1". [CS, INV, NR, PH, POL, SBM, Sens]
		deciduous trees (may include ramarack) railer main s m.	2	
		coniferous or ericaceous shrubs or trees 1-3 m tall not directly below the canopy of trees.	1	
		deciduous shrubs or trees 1-3 m tall not directly below the canopy of trees. coniferous or ericaceous shrubs <1 m tall not directly below the canopy of taller vegetation.	0	
		deciduous shrubs or trees <1 m tall (e.g., deciduous seedlings) not directly below the canopy of taller vegetation.	0	
Note :		F3 was marked 2 or greater , SKIP to F9 (N fixers).		
F4	Dominance of Most Abundant Shrub	Determine which two woody plant species comprise the greatest portion of the low (<3 m) woody cover . Then choose one: those species together comprise > 50% of such cover.	1	[PH, POL, SBM, Sens]
	Species	those species together do not comprise > 50% of such cover.	0	
F5	Woody Diameter Classes	Mark ALL the types that comprise >5% of the woody canopy cover in the AA or >5% of the wooded areas (if any) along its upland edge (perimeter). The edge should include only the trees whose canopies extend into the AA.		Estimate the diameters at chest height. If small-diameter trees are overtopped (shaded) by larger ones, visualise a "subcanopy" at the average height of the smaller-dbh trees, to serve as a basis for the
		coniferous, 1-9 cm diameter and >1 m tall. broad-leaved deciduous 1-9 cm diameter and >1 m tall.	1	minimum 5% canopy requirement in this question. The trees and shrubs need not be wetland species [AM, CS, POL, SBM, Sens, WBN]
		coniferous, 10-19 cm diameter.	1	
		broad-leaved deciduous 10-19 cm diameter.	1	
		coniferous, 20-40 cm diameter.	1

FieldF form - Non-tidal Page 3 of 5

F37	Interspersion of	During most of the part of the growing season when water is present, the spatial pattern of emergent vegetation within the water is mostly:		[AM, FA, FR, INV, NR, OE, PH, PR, SBM, SR, WBF, WBN]
	Emergents & Open Water	Scattered. More than 30% of such vegetation forms small islands or corridors surrounded by water.	0	
	water	Intermediate.	0	
		Clumped. More than 70% of such vegetation is in bands along the wetland perimeter or is clumped at one or a few sides of the surface water area.	0	
F38	Persistent Deepwater	If the deepest paich of surface water (flowing or ponded) in or directly adjacent to the AA is mostly deeper than 0.5 m for >2 weeks during the growing season, enter *1* and continue. If not, enter *0* and SKIP to F42 (Connection).	0	
F39	Area Non-vegetated Aquatic	During most of the growing season and in waters deeper than 0.5 m, the cover for fish, aquatic invertebrates, and/or amphibians that is		For this question, consider only the wood that is at or above the water surface. Estimates of underwater
	Cover	provided NOT by living vegetation, but by accumulations of dead wood and undercut banks is:		wood based only on observations from terrestrial viewpoints are unreliable so should not be attempted. [AM, FA, FR, INV]
		Little or none. Intermediate.	0	[Pag, 17, 115, 114]
E40	In elekt of televisid	Extensive.	0	DAMAN
F40	Isolated Island	The AA contains (or is part of) an island or beaver lodge within a lake, pond, or river, and is isolated from the shore by water depths > 1 m on all sides during an average June. The island may be solid, or it may be a floating vegetation mat that is sufficiently large and dense to support a waterbird nest.	0	[WBN]
	Duckweed	At some time of the year, mats of algae and/or duckweed are likely to cover >50% of the AA's otherwise-unshaded water surface, or blanket >50% of the underwater substrate. If true, enter "1" in next column. If untrue or uncertain, enter "0".	0	[EC, PR, WBF]
F42	Channel Connection & Outflow Duration	The most persistent surface water connection (outlet channel or pipe, ditch, or overbank water exchange) between the AA and a downslope stream network is: [Note: If the AA represents only part of a welland, answer this according to whichever is the least permanent surface connection: the one between the AA and the rest of the wetland, or the surface connection between the wetland and the downslope stream network.] Persistent (surface water flows out for >9 months/year).	0	Consider the connection regardless of whether the surface water is frozen. The "downslope stream network" could consist of ditches, rivers, ponds, or lakes which eventually connect to the ocean. If this cannot be determined while visiting the AA, consult topographic maps perhaps by viewing these online with Toporama (http://atlas.nrcan.gc.ca/toporama/en/index.html) [CS, FA, FR, NR, OE, PR, Sens, SFS SR, WCv, WS]
		Seasonal (surface water flows out for 14 days to 9 months/year, not necessarily consecutive).	1	
		Temporary (surface water flows out for <14 days, not necessarily consecutive). None but maps show a stream network downslope from the AA and within a distance that is less than the AA's length. SKIP to F47 (pH	0	
		Measurement).		
		No surface water flows out of the wetland except possibly during extreme events (<once (ph="" 10="" a="" an="" ditch,="" f47="" flows="" into="" lacks="" lake="" measurement).<="" only="" or="" or,="" outlet.="" per="" skip="" td="" that="" to="" water="" wetland,="" years).=""><td>0</td><td></td></once>	0	
F43	Outflow Confinement	During major runoff events, in the places where surface water exits the AA or connected waters nearby, the water:	Ŷ	"Major runoff events" would include biennial high water caused by storms and/or rapid snowmelt. [CS, NR, OE, PR, Sens, SR, STR, WS]
		Mostly passes through a pipe, culvert, narrowly breached dike, berm, beaver dam, or other partial obstruction (other than natural topography) that does not appear to drain the wetland artificially during most of the growing season.	0	
		Leaves through natural exits (channels or diffuse outflow), not mainly through artificial or temporary features. Is exported more quickly than usual due to ditches or pipes within the AA or connected to its outlet, or within 10 m of the AA's edge, which	0	
F44		drain the wetland artificially, or water is pumped out of the AA.	Ü	
F44	Tributary Channel	At least once annually, surface water from a tributary channel that is >100 m long moves into the AA. Or, surface water from a larger permanent water body adjacent to the AA spills into the AA. If it enters only via a pipe, that pipe must be fed by a mapped stream or lake further upslope. If no, SKIP to F47 (pH Measurement).	0	If inlet tributaries cannot be searched for due to inaccessibility of part of the AA, follow suggestions in F42 above. [NRv, PH, PRv, SRv]
F45	Input Water Temperature	Based on lack of shade, water source characteristics, or actual temperature measurements, the inflow is likely to be warmer than surface water in the AA during part of most years. Enter 1= yes, 0= no.	0	[WCv]
F46	Throughflow	During its travel through the AA at the time of peak annual flow, water arriving in channels: [select only the ONE encountered by most of the incoming water].		[FA, FR, INV, NR, OE, PR, SR, WS]
	Resistance	Does not bump into many plant stems as it travels through the AA. Nearly all the water continues to travel in unvegetated (often incised) channels that have minimal contact with wetland vegetation, or through a zone of open water such as an instream pond or lake.	0	
			_	
		Bumps into herbaceous vegetation but mostly remains in fairly straight channels. Bumps into herbaceous vegetation and mostly spreads throughout, or is in widely meandering, multi-branched, or braided channels.	0	
		Bumps into tree trunks and/or shrub stems but mostly remains in fairly straight channels.	0	
		Bumps into tree trunks and/or shrub stems and follows a fairly indirect path from entrance to exit (meandering, multi-branched, or braided).	0	
F47	pH Measurement	The pH in most of the AA's surface water:		Preferably, measure this in larger areas of ponded surface water within the AA, or in streams that have
		Was measured, and is: [enter the reading in the column to the right.]		passed through (not along) most of the AA. Unless surface water is completely absent, do not dig holes or make depressions in peat in order to provide water for this measurement. Avoid measuring near
		Was not measured but surface water is present and is darkly tea-coloured. Or if no surface water, then mosses and plants that indicate pealland (e.g., Labrador tea) are prevalent. Enter *11. Neither of above. Enter *11.	0	roads or in puddles formed only by recent rain. [AM, FA, FR, NR, WBF, PH, PR, Sens, WBF, WBN]
F48	TDS and/or	The TDS (total dissolved solids) or conductivity off the AA's surface water is: (select the first true row with information):		See above for measurement guidance. [FR, INV, NRv, PH, PRv, Sens]
	Conductivity	TDS is: [Enter the reading in ppm or mg/L in the column to the right, if measured, or answer next row.]		
		Conductivity is [Enter the reading in µS/cm in the column to the right.] Was not measured, but plants that indicate saline conditions cover much of the vegetated AA. Enter *1*.	0	
		Neither of above	1	
F49	Beaver Probability	Use of the AA by beaver during the past 5 years is (select most applicable ONE):	0	[FA, FR, PH, SBM, Sens, WBF, WBN]
		Evident from direct observation or presence of gnawed limbs, dams, tracks, dens, lodges, or extensive stands of water-killed trees (snags).	0	
		Likely based on known occurrence in the region and proximity to suitable habitat, which may include: (a) a persistent freshwater wetland, pond, or lake, or a perennial low or mid-gradient (<10%) channel, and (b) a corridor or multiple stands of hardwood trees and shrubs in vegetated areas near surface water.	0	
FEO	Croundy-t C:	Unlikely because site characteristics above are deficient, and/or this is a settled area or other area where beaver are routinely removed.	1	Adhere to there exists existing strictly do not we record induced to the control of the control
F50	Groundwater Strength of Evidence	Select first applicable choice: Springs are known to be present within the AA, or if groundwater levels have been monitored, that has demonstrated that groundwater primarily discharges to the wetland for longer periods during the year than periods when the wetland recharges the groundwater.	0	Adhere to these criteria strictly do not use personal judgment based on fen conditions, pH, or other evidence. Consult loggraphic maps to detect breaks in slope described here. Rust deposits associated with groundwater seeps may be most noticeable as orange discoloration in ice formations along streams during early winter. [AM, CS, FA, FR, INV, NR, CB, PH, PRV, SFS, WC, WS]
		Most of the AA has a slope of >5%, or is very close to the base of a natural slope longer than 100 and much steeper than the slope of the AA, AND the pH of surface water, if known, is >5.5.	0	
FE1	Internal Cradinat	Neither of above is true, although some groundwater may discharge to or flow through the AA. Or groundwater influx is unknown.	1	This is not the come as the charaline clane. It is the about 125
F51	Internal Gradient	The gradient along most of the flow path within the AA is: < or the AA has no surface water outlet (not even seasonally).	1	This is not the same as the shoreline slope. It is the elevational difference between the AA's inlet and outlet, divided by the flow-distance between them and converted to percent. If available, use a
		4. Or the AA has no surface water outlet (not even seasonally). 2-5%.	0	clinometer to measure this. Free clinometer apps can be downloaded to smartphones. If the wetland is large (longer than -1 km), this may be estimated using Google Earth to determine the minimum and
		6-10%. >10%.	0	maximum elevation within the AA, then dividing by length and multiplying by 100. [CS, NR, OE, PR, SR, WBF, WBN, WS]
Note fo	or the next three quest	>10%. ions: If the AA lacks an upland edge, evaluate based on the AA's entire perimeter, and moving outward into whatever areas are	0	ן אינון אינון, אינון
adjacei	nt. In many situations, th	nese questions are best answered by measuring from aerial images.		IAM FA FD INV NDv DH DOL DDv CDM Cone CDv CTD M/DMI
F52	Vegetated Buffer as % of Perimeter	Within a zone extending 30 m laterally from the AA's edge with upland and/or other wetlands, the percentage that contains perennial vegetation cover (except lawns, row crops, heavily grazed land, conifer plantations) is:		[AM, FA, FR, INV, NRv, PH, POL, PRv, SBM, Sens, SRv, STR, WBN]
		<5%.	0	
		5 to 30%. 30 to 60%.	0	
		60 to 90%. >90%, or all the area within 30 m of the AA edge is other wetlands. SKIP to F55.	0	

FieldF form - Non-tidal Page 4 of 5

53	Type of Cover in Buffer	Within 30 m upslope of where the wetland transitions to upland, the upland land cover that is NOT perennial vegetation is mostly (mark ONE):		[AM, FA, INV, NRv, PH, POL, SBM, STR, WBN]
	Type or devel in Bullet			
		Impervious surface, e.g., paved road, parking lot, building, exposed rock.	0	
		Bare or nearly bare pervious surface or managed vegetation, e.g., lawn, row crops, unpaved road, dike, landslide.	0	
54	Buffer Slope	The steepest and/or most disturbed part of the upland area that is within 30 m of the wetland and occupies >10% of that upland area has a percent slope of:		[NRv, PRv, Sens, SRv]
		<1% (flat almost no noticeable slope) or all the area within 30 m of the AA edge is other wetlands.	0	
		2-5%.	0	
		5-30%. >30%.	0	4
55	Cliffs or Steep Banks	>30%. In the AA or within 100 m, there are elevated terrestrial features such as cliffs, talus slopes, stream banks, or excavated pits (but not riprap)	0	Do not include upturned trees as potential den sites. [POL, SBM]
33	Cilis of Steep Baliks	In the zero of within 1 to m, there are executed televation realizes such as callos, and a suppes, surean varies, or exercise pins (our interpretable extend at least 2 m nearly vertically, are unvegetated, and potentially contain crevices or other substrate suitable for nesting or den areas. Enter 1 (yes) or 0 (no).	0	DO NOI INCIDURE UPERS AS POTENTIAL DEL SILES. [FOL, JUNI]
56	New or Expanded Wetland	Human actions within or adjacent to the AA have persistently expanded a naturally occurring wetland or created a wetland where there previously was none (e.g., by excavation, impoundment):		Determine this using historical aerial photography, old maps, soil maps, or permit files as available [C NR, OE, PH, Sens]
		No.	1	
		Yes, and created or expanded 20 - 100 years ago.	0	
		Yes, and created or expanded 3-20 years ago.		4
		Yes, and created or expanded within last 3 years.	0	-
		Yes, but time of origin or expansion unknown. Unknown if new or expanded within 20 years or not.	0	-
57	Burn History	More than 1% of the AA's previously vegetated area:	0	Look for charred soil or stumps (in multiple widely-spaced locations) or ask landowner. [CS, PH, STR]
	Durit History			2 South of Statings (in manages makey Spacea totalions) of ask tandomici. [63, FH, STK
		Burned within past 5 years.	0	4
		Burned 6-10 years ago.	0	4
		Burned 11-30 years ago.	0	
		Burned >30 years ago, or no evidence of a burn and no data.	1	(DLI CTD WOF)
58	Visibility	The maximum percentage of the welland that is visible from the best vantage point on public roads, public parking lots, public buildings, or public maintained trails that intersect, adjoin, or are within 100 m of the AA (select one) is:		[PU, STR, WBFv]
		<25%.		
		25·50%. >50%.	0	4
59	Non-consumptive	Assuming access permission was granted, select ALL statements that are true of the AA as it currently exists:	Ü	[PU, STR]
J7	Uses - Actual or			[10, 310]
	Potential	For an average person, walking is physically possible <u>in</u> (not just near) >5% of the AA during most of the growing season, e.g., free of deep water and dense shrub thickets.	1	
		Maintained roads, parking areas, or foot-traits are within 10 m of the AA, or the AA can be accessed part of the year by boats arriving via contiquous waters.	0	
		Within or near the AA, there is an interpretive center, trails with interpretive signs or brochures, and/or regular guided interpretive tours.	0	
60	Unvisited Core Area	The percentage of the AA almost never visited by humans during an average growing season probably comprises: [Note: Only include the part actually walked or driven (not simply viewed from) with a vehicle or boat. Do not include visitors on traits outside of the AA unless more than half the welfand is visible from the traits and they are within 30 m of the welfand edge. In that case include only the accupied by the		[AM, FAv, FRv, PH, PU, SBM, STR, WBF, WBN]
		trail.]		
		<5% and no inhabited building is within 100 m of the AA.	0	
		<5% and inhabited building is within 100 m of the AA.	0	
		5-50% and no inhabited building is within 100 m of the AA.	0	
		5-50% and inhabited building is within 100 m of the AA.	0	
		50-95%, with or without inhabited building nearby.	0	
61	Fraguently Violted	>95% of the AA with or without inhabited building nearby.		TAMA DILI DILI COMI CTD. MIDE MIDAN
01	Frequently Visited Area	The part of the AA visited by humans almost daily for several weeks during an average growing season probably comprises: [See note above.]		[AM, PH, PU, SBM, STR, WBF, WBN]
		<5%. If F60 was answered ">95%" (mostly never visited), SKIP to F64.	1	
		5-50%.	0	4
		50-95%.	0	4
	DIAD O II	>95% of the AA.	0	(DLL DLE
	BMP - Soils	Boardwalks, paved trails, fences or other infrastructure and/or well-enforced regulations appear to effectively prevent visitors from walking on soil within nearly all of the AA when the soil is unfrozen. Enter "1" if true.	0	[PH, PU]
63	BMP - Wildlife Protection	Fences, observation blinds, platforms, pawed trails, exclusion periods, and/or well-enforced prohibitions on motorised boats, off-leash pets, and off froad welnickes appear to effectively exclude or divert visitors and their pets from the AA at critical times in order to minimize disturbance of wildlife (except during hunting seasons). Enter "1" if true.	0	[AM, PU, WBF, WBN]
64	Consumptive Uses	Recent evidence was found within the AA of the following potentially-sustainable consumptive uses. Select ALL that apply.		[FAv, FRv, WBFv]
	(Provisioning Services)	Low-impact commercial timber harvest (e.g., selective thinning).	0	1
		Commercial or traditional-use harvesting of native plants, their fruits, or mushrooms.	0	1
		Waterfowl hunting.	0	1
		Fishing.	0	1
		Trapping of furbearers.	0	1
		None of the above.	1	
65	Domestic Wells	The closest wells or water bodies that currently provide drinking water are:		[NRv]
		Within 0-100 m. of the AA.	0	
		100-500 m. away.	0	1
		>500 m. away, or no information.	1	1
66	Calcareous Fen	The AA is, or is part of, a calcareous fen. See the Plants_Calcar worksheet in the accompanying Supplnfo file for list of plant indicators	0	[PH, PR]
		(calciphiles). Enter 1 If more than two Strong or more than five Moderate calciphile species are present; otherwise enter 0, but if not able to		T · ·

	NOTE: A scor	e of 0 does not	mean the func	tion or benefit i	s absent from t	ne wetland. It		

NOTE: A score of 0 does not mean the function or benefit is absent from the wetland. It means only that this wetland has a capacity that is equal or less than the lowest-scoring one, for that function or benefit, from among the 98 NB calibration wetlands that were assessed previously.

Cover Page: Basic Description of Assessment	WESP-AC version 2
Site Name:	Burchill Wind Energy Project - PLW-W-04
Investigator Name:	Derrick Mitchell
Date of Field Assessment:	10 September 2020
Nearest Town:	Lorneville (west Saint John), New Brunswick
Latitude (decimal degrees):	45.166276
Longitude (decimal degrees):	-66.205112
Is a map based on a formal on-site wetland delineation available?	
Approximate size of the Assessment Area (AA, in hectares):	0.66
AA as percent of entire wetland (approx.). Attach sketch map if AA is smaller than the entire contiguous wetland.	10
What percent (approx.) of the wetland were you able to visit?	10
What percent (approx.) of the AA were you able to visit?	
Were you able to ask the site owner/manager about any of the questions?	
Indicate here if you intentionally surveyed for rare plants, calciphile plants, or rare animals	
Have you attended a WESP-AC training session? If so, indicate approximate month & year	
How many wetlands have you assessed previously using WESP-AC? (approx.)	100+
Comments about the site or this WESP-AC assessment (attach extra page if desired):	

Form OF (Office). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Conduct an assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answering many of the questions below will require using these online map viewers:

Google Earth Pro: https://www.google.com/earth/download/gep/agree.html

GeoNB: http://www.snb.ca/geonb1/ and http://www.snb.ca/geonb1/e/apps/apps-E.asp

For most wetlands, completing this office data form will require 1-2 hours. For a list of functions to which each question pertains, see bracketed abbreviations in the Definitions/Explanations column. For detailed descriptions of each WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, PO= Pollinator Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity, STR= Stressors.

#	Indicators	Condition Choices	Data	Definitions/Explanations
OF1	Province	Mark the province in which the AA is located by changing the 0 in the column next to it to a *1*. Mark only one.		This determines to which province's calibration wetlands the raw score of any wetland is normalised.
		New Brunswick	1	In the function and benefits models, it also triggers the automatic exclusion of indicators for which no spatial data exists in a particular province.
		Nova Scotia	0	spatial data exists in a particular province.
		Prince Edward Island	0	
		Newfoundland-Labrador	0	
)F2	Ponded Area Within 1 km.	The area of surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) within 1 km is:		"Adjacent" means not separated from the AA by a wide expanse (>50 m) of upland (including roads >50 m wide). Include ponded areas likely to be hidden by wetland vegetation. If surface water
		<0.01 hectare (about 10 m x 10 m).	- 1	extends beyond 1 km, include only the part within 1 km. Do not include tidal areas. Measure the ar
		0.01 - 0.1 hectare.	0	from aerial imagery using Google Earth Pro (click on Ruler icon in toolbar, then Polygon in pop-up menu). With the GeoNB viewer, enable the Wetlands layer, then measure with the Draw & Measure
		0.1 - 1 hectare.	0	tool after specifying Aerial as the Basemap. However, do not rely entirely on wetland boundaries
		1 to 10 hectares.	0	shown in online wetlands layers. [PH, SBM, WBN]
		10 to 100 hectares.	0	
		>100 hectares.	0	
)F3	Ponded Water & Wetland Within 1 km.	The area of wetlands and surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) within 1 km is:		See definition of adjacent in OF2. If the AA's wetland vegetation extends beyond 1 km, include only the part within 1 km. "Ponded" means not flowing in rivers or streams. [Sens, WBF]
		<0.01 hectare (about 10 m x 10 m).	0	
		0.01 - 0.1 hectare.	0	
		0.1 - 1 hectare.	0	
		1 to 10 hectares.	1	
		10 to 100 hectares.	0	
-,	0. (1	>100 hectares.	0	
F4	Size of Largest Nearby Vegetated Tract or Corridor	The largest vegetated patch or corridor that includes the AA's vegetation plus aladjacent upland vegetation that is not lawn, row crops, heavily grazed lands, confler plantation is:		See definition of adjacent in OF2. Use Google Earth Pro's polygon ruler (as described above). Exclude conifer plantations only if it is obvious that trees were planted in rows. [AM, PH, SBM, Sen:
	Corridor	<0.01 hectare (about 10 m x 10 m).	0	
		0.01 - 0.1 hectare.	0	
		0.1 - 1 hectare.	0	
		1 to 10 hectares.	0	
		10 to 100 hectares.	0	
		100 to 1000 hectares.	0	
		>1000 hectares. [This is nearly always the answer in relatively undeveloped landscapes]	- 1	
F5	Distance to Large Vegetated Tract	The minimum distance from the edge of the AA to the edge of the closest vegetated land (but excluding row crops, lawn, conifer plantation) larger than 375 hectares (about 2 km on a side), is:		To measure distance, use Google Earth Pro (Ruler > Line tool). Or use Draw & Measure tool at GeoNB. The 375-ha criterion is from the Fundy Model Forest Project. [AM, PH, POL, SBM, Sens]
		<50 m, and not separated from the 375-ha vegetated area by any width ofpaved roads, stretches of open water, row crops, bare ground, lawn, or impervious surface. Or the AA itself contains >375 ha of vegetation. [This is often the answer in relatively undeveloped landscape.]	1 s.]	
		<50 m, but completely separated from the 375-ha vegetated area by those features, and AA does not contain >375 ha of vegetation.	0	
		50-500 m, and not separated.	0	
		50-500 m, but separated by those features.	0	
		0.5 - 5 km, and not separated.	0	
		0.5 - 5 km, but separated by those features.	0	
		None of the above (the closest patches or corridors which are that large are >5 km away).	0	
)F6	Herbaceous Uniqueness	The AA's vegetation cover is >10% herbaceous* but uplands within 5 km have <10% herbaceous cover. If so, enter "3" and continue to OF7. If not, consider: The AA's vegetation cover is >10% herbaceous* but uplands within 1 km have <10% herbaceous cover. If so enter "2" and continue to OF7. If not, consider: The AA's vegetation cover is >10% herbaceous* but uplands within 100 m of the wetland edge have <10% herbaceous cover. If so, enter "1". "NOTE: Exclude lawns, row crops, heavily grazed lands, forest, shrublands. Include moss as well as grasslike plants in this use of "herbaceous vegetation".	2	For this question only, consider moss to be herbaceous vegetation. Determine the score by viewing areal imagery in Google Earth fire successively davning or estimating the boundaries of the buffer of 5 km, 1 km, and 100 m radius focused on the center of the AA. Circles of specified radius can be drawn in Google Earth Pro by clicking on the Ruler Loon, then Circle in the pop-up menu. [AMV, PH POLV, SBMV, WBFV, WBNV]
)F7	Woody Uniqueness	The AA's vegetation cover is >10% woody* but uplands within 5 km have <10% woody cover. If so, enter "3" and continue to OF8. If not, consider:	2	See above. Do not consider conifer plantations to be forest if it is obvious that trees were planted in rows. [AMv, PHv, POLv, SBMv]
		The AA's vegetation is >10% woody* but uplands within 1 km have <10% woody cover. If so enter "2" and continue to OF8. If not, consider:		
		The AA's vegetalion is >10% woody" but uplands within 100 m of the wetland edge have <10% woody cover. If so, enter "1" [" NOTE: woody cover = trees & shrubs taller than 1 m.]		
F8	Local Vegetated Cover Percentage	Draw a 5-km radius circle measured from the center of the AA. Ignoring all permanent water in the circle, the percent of the remaining are that is wooded or unmanaged herbaceous vegetation (NOT lawn, row crops, bare or heavily grazed land, clearcuts, or conifer plantations) is:		In Google Earth, draw the 5 km buffer and then estimate land cover percentages, or do GIS analysi of an appropriate land cover layer. [AM, PH, POL, SBM, Sens]
		<5% of the land.	0	1
		5 to 20% of the land.	0	1
		20 to 60% of the land.	0]
		60 to 90% of the land.	0	
		>90% of the land. SKIP to OF10.	1	
F9	Type of Land Cover	Within the 5-km radius circle, and ignoring all permanent water, the land area that is bare or non-perennial cover is mostly:		[AM, SBM]
	Alteration	Impervious surface, e.g., paved road, parking lot, building, exposed rock.	0	1
		Bare pervious surface, e.g., lawn, recent (<5 yrs ago) clearcut, dirt or gravel road, cropland, landslide, conifer plantation.	0	1
F10	Distance by Road to	Measured along the maintained road nearest the AA, the distance to the nearestpopulation center is:		"Population center" means a settled area with more than about 5 regularly- inhabited structures per
	Nearest Population		^	square kilometer. In Google Earth, click on the Ruler icon, then Path, and draw and measure the
	Center	<100 m.	0	route. Or use the GeoNB's Draw & Measure tool> Freehand Line to draw and measure the route to
		100 - 500 m.	0	Settlements (click on Place Names in menu) or other areas not close to mapped settlements but which meet the criteria.[FAv, FRv, NRv, PH, PU, SBM, WBFv]
		0.5-1 km. 1 - 5 km.	0	which most the Chicha.[LAV, LIVV, MIXV, FTT, FO, SDIVI, WDFV]
		5 km.	0	
		NO MILE	0	

OF11	Distance to Nearest	From the center of the AA, the distance to the nearest maintained public road (dirt or paved) is:		Determine this by viewing aerial imagery in Google Earth and measuring with the Ruler>Line tool.
	Maintained Road	<10 m.	0	use the GeoNB's Draw Line tool. [AM, FAv, FRv, NRv, PH, PU, SBM, STR, WBN]
		10 - 25 m.	0	
		25 - 50 m.	0	
		50 - 100 m. 100 - 500 m.	0	
		>500 m.	0	
OF12	Wildlife Access	Draw a circle of radius of 5 km from the center of the AA. If mammals and amphibians can move from the center of the AA to ALL other separate wetlands and ponds located within the circle without being forced to cross pavement (any width), lawns, bare ground, and/or marine waters, mark 1 = yes can move to all, 0 = no. Change toblank if there are no other wetlands within 5 km.	0	In NB, enable the Wetlands layer in GeoNB (despite its omissions) to show surrounding wetlands a roads, while estimating the location of the 5 km circle (or draw the 5 km circle in Google Earth Pro using the Circle tool and compare). Evaluate using Google Earth, being cautious to search for roads hidden under forest canopy. [AM, SBM, STR]
OF13	Distance to Ponded	The distance from the AA center to the closest (but separate) ponded water body visible in GoogleEarth imagery is:		In Google Earth, zoom in closely to examine the surrounding landscape for ponds, lakes, and
01 13	Water	450 m, and not separated by any width of paved roads, stretches of open water, row crops, lawn, bare ground, or impervious surface.	0	wellands that appear to be permanently flooded. Enable the GeoNB viewer's Wellands layer as we [AM, PH, SBM, Sens, WBF, WBN]
		<50 m, but completely separated by those features.	0	
		50-500 m, and not separated.	1	
		50-500 m, but separated by those features. 0.5 - 1 km. and not separated.	0	
		0.5 - 1 km, but separated by those features.	0	
		None of the above (the closest patches or corridors that large are >1 km away).	0	1
OF14	Distance to Large Ponded Water	The distance from the AA center to the closest (but separate)non-lidal body of water that is ponded during most of the year and islarger than 8 hectares during most of a normal year is:		Determine this by viewing aerial imagery in Google Earth. [Sens, WBF, WBN]
		<100 m.	0	
		100 m - 1 km. 1 - 2 km.	0	-
		2-5 km.	1	
		5-10 km.	0	1
		>10 km.	0	
OF15	Tidal Proximity	The distance from the AA edge to the closesttidal water body (regardless of its salinity) is:		in Google Earth, measure the distance to the ocean (including Bay of Fundy) or tidal river, whicheve is closer. If you need to see how far upriver a river is tidal, see the KMZ file provided with this
		<100 m.	0	closer. If you need to see now far upriver a river is tidal, see the kinz life provided with this calculator for NB (NB Headtide). Points shown in those files are only an approximation, so local
		100 m - 1 km.	1	information if available may be preferable. [FA, WBF]
		1 - 5 km. 5-10 km.	0	
		5-10 Km. 10-40 km.	0	-
		>40 km.	0	
OF16	Upland Edge Contact	Select one:		[NR, SBM, Sens]
		The AA has no upland edge (or upland is <1% of perimeter). The AA is entirely surrounded by (& contiguous with) other wetlands or water	. 0	
		1-25% of the AA's perimeter abuts upland (including filled areas). The rest adjoins other wetlands or water that is mostly wider than the AA	0	
		25-50% of the AA's perimeter abuts upland. The rest adjoins other wetlands or water that is mostly wider than the AA.	0	
		50-75% of the AA's perimeter abuts upland. The rest adjoins other wetlands or water that is mostly wider than the AA. More than 75% of the AA's perimeter abuts upland. Any remainder adjoins other wetlands or water that is mostly wider than the AA.This	0	
		will be true for most assessments done with WESP-AC.		
OF17		Within 5 km downstream or downslope of the AA (select first true choice):		In the GeoNB map viewer: click on "More" in upper right, then "Flood Information". Expand the mer
	tidal Waters	Maps show Flood Zone or Flood Risk areas and there appears to be infrastructure vulnerable to river flooding not caused by tidal storm surges.	0	under it by clicking on the arrow to its left and the slider to its right. Uncheck the first (Limits of Data box. Where available, LIDAR imagery can provide finer elevational resolution useful for flood modeling, IWSV)
		Maps show Flood Zone or Flood Risk areas, but infrastructure is absent or is not vulnerable to floods from a non-lidal river. In some cases evees, upriver dams, or other meastures may partly limit damage or risk from smaller events. Maps do not show Flood Zone or Flood Risk areas for no such mapping has been done locally) and there appears to be infrastructure	0	
		vulnerable to river flooding unrelated to tidal storm surges. Maps do not show Flood Zone or Flood Risk areas (or no such mapping has been done locally) and there i no infrastructure vulnerable	1	
OF18	Relative Elevation in Watershed	to river flooding unrelated to tidal storm surges. In Google Earth, enable the Terrain layer (lower left menu) and open the NB_Watersheds KMZ file that accompanies this calculator. Then determine the AA's approximate elevation (bottom right, NOT the "eye att"). Then move cursor around to determine the watershed's	0.23	[FA, NR, Sens, SFSv, WCv, WSv]
OF19	Water Quality Sensitive	maximum and minimum elevation. Divide the AA's elevation by the (max-min). In Google Earth, open the KMZ file NB_Watershed Protected Area which accompanies this calculator. The AA is within such an area.	0	If an ACCDC report is available for this AA, it also may contain such information. [NRv]
OF20	Watershed or Area Degraded Water	Enter 1= yes, 0= no. Sampling indicates a problem with concentrations ofmetals, hydrocarbons, nutrients, or other substances (excluding bacteria, acidic		May use existing data, or sample those waters as part of this wetland assessment. "Harmful" should
UFZU	Upstream	water, high temperatures) being present at levels harmful to aquatic life or humans, and:	0	way use existing data, or sample index waters as part or this wettain assessment. Faithful should be evaluated with regard to current federal or provincial water quality standards. [AM, FA, FR, NRv PRv, SRv, STR, WBF, WBN]
		The condition is present within the AA. The condition is present in waters within 1 km that flowinto the AA, but has not been documented in the AA itself.	0	1
		Sampling during both low water periods and times with high runoff (storms, snowmelt) indicates no problems in either the AA or inflowing waters.	0	
		Data are insufficient (no or inadequate sampling within 1 km, or condition exists only at >1 km upstream)This is the situation for nearly all wetlands in this region.	1	
OF21	Degraded Water Downstream	The problem described above is downslope from the AA, and:		May use existing data, or monitor waters as part of this wetland assessment. [NRv, PRv, SRv]
	Downstream	The condition is present within 1 km downslope and connected to the AA by a channel.	0	
		The condition is present within 5 km downslope and connected to the AA by a channel, or within 1 km but not connected to the AA by a channel. Sampling during both low water periods and times with high runoff (storms, snowmett) indicates no problems in either the AA or inflowing	0	
		waters. Data are insufficient (no or inadequate sampling within 1 km, or condition exists only at >1 km upstream)This is the situation for nearly	1	
OFC		all wetlands in this region.		
OF22	Wetland as a % of Its Contributing Area (Catchment)	From a topographic map and field observations, estimate the approximate boundaries of the catchment (CA) of the entire wetland of which AM may be only a part. Then adjust those boundaries if necessary based on your field observations of the surrounding and/or busing procedures described in the Manual. Divide the area of the wetland (not just the AA) by the approximate area of its catchment excluding the area of the wetland itself. When doing the calculation, if ponded water is adjacent to the wetland, include that in the wetland area. The result is:		Topographic maps may be viewed online at the National Atlas of Canada (Toporama): http://atlas.gc.ca/loporama/en/index.html [NR, PR, Sens, SR, WS]
		< 0.01, or calchment size unknown due to stormwater pipes that collect water from an indeterminate area. 0.01 to 0.1.	0	
		0.1 to 1.	1	
OF23	Unvegetated Surface in	>1 (welland is larger than its catchment (e.g., welland with flat surrounding terrain and no inlet, or is entirely isolated by dikes, or is a raised bog). The proportion of the AA's contributing area (measured to no more than 1000 m upslope) that is comprised of buildings, roads, parking lots	0	[FA, INV, NRv, PRv, SRv, STR, WCv, WSv]
OI 23	the Contributing Area	other pavement, exposed bedrock, landslides, and other mostly-bare surface is about :		C, 1107, 1107, FRY, 510, WOY, WSY
		<10%.	1	
		<10%. 10 to 25%.	0	

OF24	Transport From Upslope	A relatively large proportion of the precipitation that falls farther upslope in the CA reaches this wetland quickly as runoff (surface water), a	9	[NRv, PRv, SRv, WSv]
		indicated by the following:		
		(a) input channel is present,		
		(b) input channels have been straightened, (c) upslope wetlands have been ditched extensively,		
		(d) land cover is mostly non-forest,		
		(e) CA slopes are steep, and/or		
		(f) most CA soils are shallow (bedrock near surface) and/or have high runoff coefficients.		
		This statement is:		
		Mostly true.	0	1
		Somewhat true.	0	1
		Mostly untrue.	1	
OF25	Aspect	The overland flow direction of most surface water (in streams, rivers, or runoff) that enters the AA is:		[AM, NR, SFS, WC, WS]
01 23	нарост			[Am, MC, 31-3, NO, NO]
		Northward (N, NE). north-facing contributing area.	0	
		Southward (S, SW). south-facing contributing area.	1	
		Other (E, SE, W, NW), or no detectable uphill slope or input channel (flat).		
OF26	Internal Flow Distance	The horizontal flow distance from the wetland's inlet to outlet is:		Identify inlets and outlets, if any, from topographic maps (use elevations to determine which are inlet
	(Path Length)	10	0	and which are outlets) and augment by field inspection. [NR, OE, PR, SR, WS]
		<10 m.	0	
		10 - 50 m.	0	
		50 - 100 m.	0	
		100 - 1000 m.	1	
		1- 2 km.	0	
		>2 km, or wetland lacks an inlet and outlet.	0]
OF27	Growing Degree Days	In Google Earth, open the KMZ file that accompanies this calculator, called NB-PEI_GrowingDegreeDays. Place your cursor over the AA		This layer was provided by Dr. Dan McKenney of the Canadian Forest Service [AM, CS, FR, INV,
		and left-click. From the pop-up, enter the GRIDCODE in the next column.	2428	NR, OE, PH, PR, Sens, SR, WBF, WCv, WS]
OF28	Fish Access or Use	According to agency biologists and/or your own observations, the AA. [Nark just the first choice that is true.]:		Regarding the last choice, if uncertain if an AA is fishless, consider the possibility its waters have be
. 20				stocked. In NB, the list of stocked waters is at:
		is known to support rearing and/or spawning by Atlantic salmon or other anadromous species or eels. In NB, consult Figure A-2 in	0	http://www2.gnb.ca/content/gnb/en/departments/erd/natural_resources/content/fish/content/Stocked
		Appendix A of the Manual. Contact local fishery biologists, review the ACCDC report, and visit these websites:		aters.html
		http://www.salmonatlas.com/atlanticsalmon/canada-east/index.1.html http://atlanticsalmonfederation.org/rivers/introduction.html		[AM, FA, FR, INV, WBF, WBN]
		Has not been documented to support Atlantic salmon rearing and/or spawning, but is connected to nearby waters likely to contain Atlantic	0	
		salmon or other anadromous species or eels and is probably accessed by those during some conditions.		
		Is probably is not accessed by any anadromous fish species but is known or likely to hav other fish at least seasonally.	0	
		Is known or likely to be fishless (e.g., too small, dry, and/or not accessible even temporarily, and not stocked).	- 1	
OF29	Species of Conservation	Within the past 10 years, in the AA (or in its adjoining waters or wetland), qualified observers have documented mark all applicable:		Request information from ACCDC and/or conduct your own survey at an appropriate season using a
	Concern			approved protocol. For birds, also check eBird.org. [AMv, EC, PHv, POLv, SBMv, Sens, WBFv,
		Presence of one or more of the plant species listed in the Plants_Rare worksheet of the accompanying Supplinfo file, or the AA is within a	0	WBNv]
		mapped Atlantic Coastal Plain Flora Buffer	U	
		Presence of one or more of the amphibian or reptile species (AM) of conservation concern as listed in the Wildlife_Rare worksheet of the accompanying Supplnfo file.	0

OF38	Ownership	Select the ONE ownership that covers the most of the AA. In Google Earth, open KMZ file called NB Crown lands. Use more recent		"Private lands" may include those owned or leased by non-governmental organizations, e.g.,
		information if available.		charitable conservation land trusts, DUC, TNC. [PU, STR]
		New timber harvest, roads, mineral extraction, and intensive summer recreation (e.g., off-road vehicles) are permanently prohibited.	0	
		Includes many publicly-owned Protected Lands, and private lands under long-term (30+ year) legal agreements to maintain nearly-unalter	4	
		conditions.	<u></u>	
		Ownership is public (e.g., municipal, Crown Reservations/Notations) but some or all of the above activities are allowed.	1	
		Ownership is private but public access is allowed, and/or a shorter-term conservation easement (whether renewable or not) is in place.	0	
		Ownership is private and owner does not allow access, or access permission unknown, and not a conservation easement.	0	1

Date: 10 September 2020 Site Identiffier: PLW-W-04 Investigator: Derrick Mitc

Form F (Field). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Walk for no less than 10 minutes from the wetland edge towards its core, in the part of the AA that is proposed for alteration. If no alteration is proposed, walk in a portion that appears to be most representative of the wetland overall. Walk only where it is safe and legal to do so. Conduct the assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answer these questions primarily based on your onsite observations and interpretations. Do not write in shaded parts of this data form. Answering some questions accurately may require conferring with the landowner or other knowledgable persons and/or reviewing aerial imagery. For most wetlands, completing this field data form will require 1-2 hours on a site. For a list of functions to which each question pertains, see the accompanying Interpretations form. For detailed descriptions of each WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage & Delay, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity, STR= Stressors.

	_			
#	Indicators	Condition Choices	Data	Definitions/Explanations
-1	Wetland Type	Follow the key below and mark the ONE row that best describes MOST of the vegetated part of the AA:		Ericaceous shrubs are ones in the heather family (Ericaceae). Most have leathery evergreen leaves. They include rhododendron, azalea, swamp laurel, leatherleaf, Labrador tea, and others. Most require
		A. Moss and/or lichen cover more than 25% of the ground. Often dominated by ericaceous shrubs (e.g., Labrador tea) or other acid-tolerant plants (e.g., bog cranberry, pitcher plant, sundew, orchids). Substrate is mostly undecomposed peat. Choose between A1 and A2 and mark the choice with a 1 in their adjoining column. Otherwise go to 8 below.		acidic soil. Although not in the family Ericaceae, sweetgale (Myrica gale) should be counted also. [AM, CS, FA, FR, INV, NR, OE, PH, Sens, SFS, WBF, WBN]
		A1. Surface water is usually absent or, if present, pH is typically <4.5 and conductivity is usually <100 μS/cm (<64 ppm TDS). Trees are absent or nearly so. Sedge cover usually sparse or absent but cottongrass and/or lichen cover may be extensive, as well as cloudberry, lingonberry, sheep laurel, and a sedge (<i>Carex rarillor</i> a). Welland surface and surrounding landscape are seldom sloping and welland often is domed (convex). Inlet and outlet channels are usually absent. If known, pH of peat is <4.0.	0	
		A2. Not A1. Surface water, if present, has pH typically >4.5 and conductivity is usually >100 µS/cm (>64 ppm TDS). Sedge cover is usually extensive, and/or tree and tall shrub cover is extensive. Sometimes at toe of slope or edge of water body. An exit channel is usually present. Wetter than A1 and peat depth may be shallower (<2 m).	0	
		B. Moss and/or lichen cover less than 25% of the ground. Soil is mineral or decomposed organic (muck). Choose between B1 and B2 and mark the choice with a 1 in their adjoining column:		
		B1. Trees and shrubs taller than 1 m comprise more than 25% of the vegetated cover. Surface water is mostly absent or inundates the vegetation only seasonally (e.g., vernal pools or floodplain).	1	
		B2. Not B1. Tree & tall shrubs comprise less than than 25% of the vegetated cover. Vegetation is mostly herbaceous, e.g., cattail, bufusch, burreed, pond lily, horsetail. Surface water may be extensive and fluctuates seasonally, being either persistent or drying up partly or entirely.	0	
AA sh includ " adja descri	ould also include part of i e the open water part adj cent " is used synonymou bed features along their i must match. The featur	he AA should include all persistent waters in ponds smaller than 8 hectares (-283 m on a side) that are adjacent to the AA. The the water area of adjacent ponded water larger than 8 ha and adjacent rivers wider than 20 m. Specifically As should lacent to wetland vegetation and equal in width to the average width of that vegetated zone. Throughout this data form, usly with abutting, adjoining, bordering, contiguous – and means no upland (mammade or natural) completely separates the directly shared edge. Features joined only by a channel are not necessarily considered to be adjacent – a large portion of their es do not have to be hydrologically connected in order to be considered adjacent.		
F2	Wetland Types - Adjoining or Subordinate	If the AA is smaller than 1 ha, mark all other types that occupy more than 1% of the vegetated AA. If the AA is larger than 1 ha, mark all other types which are within or adjacent to the AA and occupy more than 1 ha, as visible from the AA or as interpreted from aerial imagery. Do not mark again the type marked in F1.		1 hectare is 10,000 sq. m or about 2.5 acres. It could have dimensions of 100 m by 100 m, 1000 m by 10 m, or similar. [AM, INV, SBM, WBF]
		A1. A2.	0	
		B1. B2.	0	
F3	Woody Height & Form Diversity	DZ. Following EACH row below, indicate with a number code the percentage of the living vegetation in the AA which is occupied by that feature (6 if >95%, 5 if 75 >55%, 4 if 50-75%, 3 if 72-55%, 2 if 5-25%, 1 if -55%, 0 if none). If the vegetated part of the AA is largely herbaceous (non-woody) vegetation, these percentages should not sum to 100%.	0	Deciduous shrubs in this region usually include buttonbush, Labrador tea, bayberry (Moreila), huckleberry, cranberry, cloudberry, sweetgale, alder, willow, birch, ash, dogwood, and a few others. If you assigned a code of 3 or higher to any of the first four choices and the ground cover beneath the
		coniferous trees (may include tamarack) taller than 3 m.	5	trees/shrubs is <25% moss, then question F1 might be "B1". [CS, INV, NR, PH, POL, SBM, Sens]
		deciduous trees taller than 3 m. coniferous or ericaceous shrubs or trees 1-3 m tall not directly below the canopy of trees.	0	
		deciduous shrubs or trees 1-3 m tall not directly below the canopy of trees. coniferous or ericaceous shrubs <1 m tall not directly below the canopy of taller vegetation.	0	
		deciduous shrubs or trees <1 m tall (e.g., deciduous seedlings) not directly below the canopy of taller vegetation.	0	
Note:		F3 was marked 2 or greater , SKIP to F9 (N fixers).		
F4	Dominance of Most Abundant Shrub	Determine which two woody plant species comprise the greatest portion of the low (<3 m) woody cover . Then choose one: those species together comprise > 50% of such cover.	1	[PH, POL, SBM, Sens]
ГС	Species Meady Diameter	those species together do not comprise > 50% of such cover. Mark ALL the types that comprise >5% of the woody canopy cover in the AA or >5% of the wooded areas (if any) along its upland edge	0	Estimate the diameters at chest height. If small-diameter trees are overtopped (shaded) by larger
ıJ	Woody Diameter Classes	(perimeter). The edge should include only the trees whose canopies extend into the AA.		Estimate the unimers at criest regin. If sharmanness here are very expect sharest player ones, visualise a "subcanopy" at the average height of the smaller-dbh trees, to serve as a basis for the minimum 5% canopy requirement in this question. The trees and shrubs need not be welland species.
		coniferous, 1-9 cm diameter and >1 m tall. broad-leaved deciduous 1-9 cm diameter and >1 m tall.	1	[AM, CS, POL, SBM, Sens, WBN]
		coniferous, 10-19 cm diameter.	1	
		broad-leaved deciduous 10-19 cm diameter. coniferous, 20-40 cm diameter.	1	
		broad-leaved deciduous 20-40 cm diameter.	0	
		coniferous, >40 cm diameter.	1	
Г4	Holaht Class	broad-leaved deciduous > 40 cm diameter.	0	[AM, INV, NR, PH, SBM, Sens]
10	Height Class Interspersion	Follow the key below and mark the ONE row that best describes MOST of the AA: A. Neither the vegetation taller than 1 m nor the vegetation shorter than that comprise >70% of the vegetated part of the AA. They each comprise 30-70%. Choose between A1 and A2 and mark the choice with a 1 in the adjoining column. Otherwise go to B below.		(pour, intr, FTI, Julion, Seria)
		A1. The two height classes are mostly scattered and intermixed throughout the AA.	0	
		A2. Not A1. The two height classes are mostly in separate zones or bands, or in proportionately large clumps. B. Either the vegetation shorter than 1 m comprises > 70% of the vegetated part of the AA, or the vegetation taller than that does. One size class might even be totally absent. Choose between B1 and B2 and mark the choice with a 1 in the adjoining column:	0	
		B1. The less prevalent height class is mostly scattered and intermixed within the prevalent one.	1	
F7	Large Snags (Dead	B2. Not B1. The less prevalent height class is mostly located apart from the prevalent one, in separate zones or clumps, or is completely absent. The number of large snags (diameter >20 cm) in the AA plus adjacent upland area within 10 m of the wetland edge is:	0	Snags are dead standing trees that often (not always) lack bark and foliage. Include only ones that are
. ,	Standing Trees)	None, or fewer than 8/ hectare which exceed this diameter.	0	Shags are used startung trees that other (not aways) lack bank and tollage. Include only ones that are at least 2 m tall. [POL, SBM, WBN]
		Several (>8/hectare) and a pond, lake, or slow-flowing water wider than 10 m is within 1 km.	1	
		Several (>8/hectare) but above not true.	0	
F8	Downed Wood	The number of downed wood pieces longer than 2 m and with diameter >10 cm, and not persistently submerged, is:		Exclude temporary "burn piles." [AM, INV, POL, SBM]
F8	Downed Wood	The number of downed wood pieces longer than 2 m and with diameter >10 cm, and not persistently submerged, is: Few or none that meet these criteria.	0	Exclude temporary "burn piles." [AM, INV, POL, SBM]

FieldF form - Non-tidal Page 1 of 5

FO	N Fixers	The percentage of the AA's vegetated cover that contains nitrogen-fixing plants (e.g., alder, sweetgale, clover, lupine, alfalfa, other legumes)		Do not include N-fixing algae or lichens. [FA, FR, INV, NRv, OE, PH, SBM, Sens]
,	IN FIXEIS	is:		Do not include (4 liking algae of ilciteris: [; 7, 7 K, 1144, 1144, 02, 1 H, 3518, 3518]
		<1% or none.	0	
		1-25% of the vegetated cover, in the AA or along its water edge (whichever has more).	1	
		25-50% of the vegetated cover, in the AA or along its water edge (whichever has more). 50-75% of the vegetated cover, in the AA or along its water edge (whichever has more).	0	
		>75% of the vegetated cover, in the AA or along its water edge (whichever has more).	0	
F10	Sphagnum Moss	The cover of Sphagnum moss (or any moss that forms a dense cushion many centimeters thick), including the moss obscured by taller		Exclude moss growing on trees and rocks. [CS, PH]
	Extent	sedges and other plants rooted in it, is:		
		<5% of the vegetated part of the AA.	0	
		5-25% of the vegetated part of the AA. 25-50% of the vegetated part of the AA.	0	
		50-95% of the vegetated part of the AA.	1	
		>95% of the vegetated part of the AA.	0	
F11	% Bare Ground &	Consider the parts of the AA that lack surface water at the driest time of the growing season. Viewed from directly above the ground layer, the		Thatch is dead plant material (stems, leaves) resting on the ground surface. Bare ground that is
	Thatch	predominant condition in those areas at that time is:		present under a tree or shrub canopy should be counted. Boulders count as bare ground. Wetlands with mineral soils and that are heavily shaded or are dominated by annual plant species tend to have
		Little or no (<5%) bare ground is visible between erect stems or under canopy anywhere in the vegetated AA. Ground is extensively blanketed by dense thatch, moss, lichens, graminoids with great stem densities, or plants with ground-hugging foliage.	0	more extensive areas that are bare during the early growing season. [AM, EC, INV, NR, OE, POL, PR,
				SBM, Sens]
		Slightly bare ground (5-20% bare between plants) is visible in places, but those areas comprise less than 5% of the unflooded parts of the	1	
		AA. Much bare ground (20-50% bare between plants) is visible in places, and those areas comprise more than 5% of the unflooded parts of the	0	
		AA.		
		Other conditions.	0	
		Not applicable. Surface water (either open or obscured by emergent plants) covers all of the AA all the time.	0	
F12	Ground Irregularity	Imagine the AA without any living vegetation. Excluding the portion of the AA that is always under water, the number of hummocks, small pits, raised mounds, animal burrows, ruts, gullies, natural levees, microdepressions, and other areas of peat or mineral soil that are raised or		The depressions may be of human or natural origin. [AM, EC, INV, NR, PH, POL, PR, SBM, SR, WS]
		depressed >10 cm compared to most of the area within a few meters surrounding them is:		
		Few or none (minimal microtopography; <1% of the land has such features, or entire AA is always water-covered).	0	
		Intermediate.	1	
Ec.		Several (extensive micro-topography).	0	TALL ND COM
F13	Upland Inclusions	Within the AA, inclusions of upland are:		[AM, NR, SBM]
		Few or none.	0	
		Intermediate (1 - 10% of vegetated part of the AA). Many (6 g. westland unland "massis" - 10% of the vegetated AA).	0	
F14	Soil Texture	Many (e.g., wetland-upland "mosaic", >10% of the vegetated AA). In parts of the AA that lack persistent water, the texture of soil in the uppermost layer is mostly: [To determine this, use a trowel to check in at	U	[CS, NR, OE, PH, PR, Sens, SFS, WS]
	Son Texture	least 3 widely spaced locations, and use the soil texture key (in Appendix A of the Manual).]		[65] 111, 62, 111, 11, 6613, 613, 110]
		Loamy: soils that may contain a little fine grit and do not make a "ribbon" longer than 2 cm when moistened, rolled, squeezed, and extended	0	
		between thumb and forefinger.		
		Fines: includes silt, clay, silt, soils that make a ribbon longer than 2 cm when moistened, rolled, squeezed, and extended between thumb and forefinger.	0	
		Deep Peat, to 40 cm depth or greater.	0	
		Shallow Peat or organic <40 cm deep.	1	
		Coarse: includes sand, loamy sand, gravel, cobble, soils that do not make a ribbon when moistened, rolled, squeezed, and extended	0	
F15	Shorebird Feeding	between thumb and forefinger. During any 2 consecutive weeks of the growing season, the extent of mudflats, bare unshaded saturated areas not covered by thatch, and		This addresses needs of many but not all migratory sandpipers, plovers, and related species. [WBF]
	Habitats	unshaded waters shallower than 6 cm is: [Include also any area that is adjacent to the AA.]		, , , , , , , , , , , , , , , , , ,
		None, or <100 sq. m.	1	
		100-1000 sq. m.	0	
		1000 – 10,000 sq. m. >10,000 sq. m.	0	
F16	Herbaceous % of	In aerial ("ducks eye") view, the maximum annual cover of herbaceous vegetation (all non-woody plants except moss) is:	0	[AM, WBF, WBN]
	Vegetated Wetland	<5% of the vegetated part of the AA or <0.01 hectare (whichever is less). Mark "1" here and SKIP to F20 (Invasive Plant Cover).	1	
		5-25% of the vegetated part of the AA.	0	
		25-50% of the vegetated part of the AA.	0	
		50-95% of the vegetated part of the AA.	0	
		>95% of the vegetated part of the AA.	0	
F17	Forb Cover	Within parts of the AA having herbaceous cover (excluding SAV), the areal cover of forbs reaches an annual maximum of:		Forbs are flowering plants. Do not include grasses, sedges, cattail, other graminoids, ferns, horsetails, or others that lack showy flowers. [POL]
		<5% of the herbaceous part of the AA.	0	
		5-25% of the herbaceous part of the AA. 25-50% of the herbaceous part of the AA.	0

FieldF form - Non-tidal Page 3 of 5

F37	Interspersion of	During most of the part of the growing season when water is present, the spatial pattern of emergent vegetation within the water is mostly:		[AM, FA, FR, INV, NR, OE, PH, PR, SBM, SR, WBF, WBN]
	Emergents & Open Water	Scattered. More than 30% of such vegetation forms small islands or corridors surrounded by water.	0	
	water	Intermediate.	0	
		Clumped. More than 70% of such vegetation is in bands along the wetland perimeter or is clumped at one or a few sides of the surface water area.	0	
F38	Persistent Deepwater	if the deepest patch of surface water (flowing or ponded) in or directly adjacent to the AA is mostly deeper than 0.5 m for >2 weeks during the growing season, enter "1" and continue. If not, enter "0" and SKIP to F42 (Connection).	0	
F39	Area Non-vegetated Aquatic	During most of the growing season and in waters deeper than 0.5 m, the cover for fish, aquatic invertebrates, and/or amphibians that is		For this question, consider only the wood that is at or above the water surface. Estimates of underwater
	Cover	provided NOT by living vegetation, but by accumulations of dead wood and undercut banks is:		wood based only on observations from terrestrial viewpoints are unreliable so should not be attempted. [AM, FA, FR, INV]
		Little or none. Intermediate.	0	[Pag, 17, 115, 114]
E40	teeleted televid	Extensive.	0	BAIDAR
F40	Isolated Island	The AA contains (or is part of) an island or beaver lodge within a lake, pond, or river, and is isolated from the shore by water depths > 1 m on all sides during an average June. The island may be solid, or it may be a floating vegetation mat that is sufficiently large and dense to support a waterbird nest.	0	[WBN]
	Duckweed	At some time of the year, mats of algae and/or duckweed are likely to cover >50% of the AA's otherwise-unshaded water surface, or blanket >50% of the underwater substrate. If true, enter "1" in next column. If untrue or uncertain, enter "0".	0	[EC, PR, WBF]
F42	Channel Connection & Outflow Duration	The most persistent surface water connection (outlet channel or pipe, dilct, or overbank water exchange) between the AA and a downslope stream network is: [Note: If the AA represents only part of a wetland, answer this according to whichever is the least permanent surface connection: the one between the AA and the rest of the wetland, or the surface connection between the wetland and the downslope stream network.] Persistent (surface water flows out for >9 months/year).	1	Consider the connection regardless of whether the surface water is frozen. The "downslope stream network" could consist of ditches, rivers, ponds, or lakes which eventually connect to the ocean. If this cannot be determined while visiting the AA, consult topographic maps perhaps by viewing these online with Toporama (http://atlas.nrcan.gc.ca/toporama/en/index.html) [CS, FA, FR, NR, OE, PR, Sens, SFS SR, WCV, WS]
		Seasonal (surface water flows out for 14 days to 9 months/year, not necessarily consecutive).	0	
		Temporary (surface water flows out for <14 days, not necessarily consecutive). None but maps show a stream network downslope from the AA and within a distance that is less than the AA's length. SKIP to F47 (pH	0	
		Measurement).	0	
		No surface water flows out of the welland except possibly during extreme events (-once per 10 years). Or, water flows only into a welland, ditch, or lake that lacks an outlet. SKIP to F47 (pH Measurement).	U	
F43	Outflow Confinement	During major runoff events, in the places where surface water exits the AA or connected waters nearby, the water: Medity passes through a rine, where the passes through the passes through a rine, where the passes through a rine, where the passes through a rine water through the passes through a rine water.	^	"Major runoff events" would include biennial high water caused by storms and/or rapid snowmelt. [CS, NR, OE, PR, Sens, SR, STR, WS]
		Mostly passes through a pipe, culvert, narrowly breached dike, berm, beaver dam, or other partial obstruction (other than natural topography) that does not appear to drain the wetland artificially during most of the growing season.	0	
		Leaves through natural exits (channels or diffuse outflow), not mainly through artificial or temporary features. Is exported more quickly than usual due to ditches or pipes within the AA or connected to its outlet, or within 10 m of the AA's edge, which	0	
F44	Tributary Channel	drain the welland artificially, or water is pumped out of the AA. At least once annually, surface water from a tributary channel that is >100 m long moves into the AA. Or, surface water from a larger		If inlet tributaries cannot be searched for due to inaccessibility of part of the AA, follow suggestions in
	,	permanent water body adjacent to the AA spills into the AA. If it enters only via a pipe, that pipe must be fed by a mapped stream or lake further upslope. If no, SKIP to F47 (pH Measurement).	0	F42 above. [NRv, PH, PRv, SRv]
F45	Input Water Temperature	Based on lack of shade, water source characteristics, or actual temperature measurements, the inflow is likely to be warmer than surface water in the AA during part of most years. Enter 1= yes, 0= no.	0	[WCv]
F46	Throughflow Resistance	During its travel through the AA at the time of peak annual flow, water arriving in channels: [select only the ONE encountered by most of the incoming water].		[FA, FR, INV, NR, OE, PR, SR, WS]
	resistance	Does not bump into many plant stems as it travels through the AA. Nearly all the water continues to travel in unvegetated (often incised) channels that have minimal contact with wetland vegetation, or through a zone of open water such as an instream pond or lake.	0	
		Bumps into herbaceous vegetation but mostly remains in fairly straight channels.	0	
		Bumps into herbaceous vegetation and mostly spreads throughout, or is in widely meandering, multi-branched, or braided channels.	0	
		Bumps into tree trunks and/or shrub stems but mostly remains in fairly straight channels. Bumps into tree trunks and/or shrub stems and follows a fairly indirect path from entrance to exit (meandering, multi-branched, or braided).	0	
F47	pH Measurement	The pH in most of the AA's surface water:		Preferably, measure this in larger areas of ponded surface water within the AA, or in streams that have
		Was measured, and is: [enter the reading in the column to the right.]		passed through (not along) most of the AA. Unless surface water is completely absent, do not dig holes or make depressions in peat in order to provide water for this measurement. Avoid measuring near
		Was not measured but surface water is present and is darkly tea-coloured. Or if no surface water, then mosses and plants that indicate peatland (e.g., Labrador tea) are prevalent. Enter *1*. Neither of above. Enter *1*.	0	roads or in puddles formed only by recent rain. [AM, FA, FR, NR, WBF, PH, PR, Sens, WBF, WBN]
F48	TDS and/or Conductivity	The TDS (total dissolved solids) or conductivity off the AA's surface water is: (select the first true row with information):		See above for measurement guidance. [FR, INV, NRv, PH, PRv, Sens]
	Conductivity	TDS is: [Enter the reading in ppm or mg/L in the column to the right, if measured, or answer next row.] Conductivity is [Enter the reading in µSicm in the column to the right.]		
		Was not measured, but plants that indicate saline conditions cover much of the vegetated AA. Enter "1".	0	
F49	Beaver Probability	Neither of above Use of the AA by beaver during the past 5 years is (select most applicable ONE):	1	[FA, FR, PH, SBM, Sens, WBF, WBN]
		Evident from direct observation or presence of gnawed limbs, dams, tracks, dens, lodges, or extensive stands of water-killed trees (snags).	0	
		Likely based on known occurrence in the region and proximity to suitable habitat, which may include: (a) a persistent freshwater wetland, pond, or lake, or a perennial low or mid-gradient (<10%) channel, and (b) a corridor or multiple stands of hardwood trees and shrubs in	0	
		vegetated areas near surface water. Unlikely because site characteristics above are deficient, and/or this is a settled area or other area where beaver are routinely removed.	1	
F50	Groundwater Strength of Evidence	Select first applicable choice:		Adhere to these criteria strictly do not use personal judgment based on fen conditions, pH, or other evidence. Consult topographic maps to detect breaks in slope described here. Rust deposits
	or Evidence	Springs are known to be present within the AA, or if groundwater levels have been monitored, that has demonstrated that groundwater primarily discharges to the wetland for longer periods during the year than periods when the wetland recharges the groundwater.	0	estudence. Consult uppographic maps to udect of each in slope described neter. Add reposts associated with groundwater seeps may be most noticeable as orange discoloration in ice formations along streams during early winter. [AM, CS, FA, FR, INV, NR, OE, PH, PRV, SFS, WC, WS]
		Most of the AA has a slope of >5%, or is very close to the base of a natural slope longer than 100 and much steeper than the slope of the AA, AND the pH of surface water, if known, is >5.5. Neither of above is true, although some groundwater may discharge to or flow through the AA. Or groundwater influx is unknown.	0	
F51	Internal Gradient	The gradient along most of the flow path within the AA is:		This is not the same as the shoreline slope. It is the elevational difference between the AA's inlet and
		<2% or the AA has no surface water outlet (not even seasonally).	0	outlet, divided by the flow-distance between them and converted to percent. If available, use a clinometer to measure this. Free clinometer apps can be downloaded to smartphones. If the wetland is
		2-5%. 6-10%.	0	large (longer than –1 km), this may be estimated using Google Earth to determine the minimum and maximum elevation within the AA, then dividing by length and multiplying by 100. [CS, NR, OE, PR,
No.		>10%.	0	SR, WBF, WBN, WS]
adjacei	nt. In many situations, th	ons: If the AA lacks an upland edge, evaluate based on the AA's entire perimeter, and moving outward into whatever areas are lese questions are best answered by measuring from aerial images.		
F52	Vegetated Buffer as % of Perimeter	Within a zone extending 30 m laterally from the AA's edge with upland and/or other wetlands, the percentage that contains perennial vegetation cover (except lawns, row crops, heavily grazed land, conifer plantations) is:		[AM, FA, FR, INV, NRv, PH, POL, PRv, SBM, Sens, SRv, STR, WBN]
	a Gilliotol	<5%.	0	
		5 to 30%. 30 to 60%.	0	
		60 to 90%.	0	
		>90%, or all the area within 30 m of the AA edge is other wetlands. SKIP to F55.	1	

FieldF form - Non-tidal Page 4 of 5

53	Type of Cover in Buffer	Within 30 m upslope of where the wetland transitions to upland, the upland land cover that is NOT perennial vegetation is mostly (mark ONE):		[AM, FA, INV, NRv, PH, POL, SBM, STR, WBN]
	Type or devel in Bullet			
		Impervious surface, e.g., paved road, parking lot, building, exposed rock.	0	
		Bare or nearly bare pervious surface or managed vegetation, e.g., lawn, row crops, unpaved road, dike, landslide.	0	
54	Buffer Slope	The steepest and/or most disturbed part of the upland area that is within 30 m of the wetland and occupies >10% of that upland area has a percent slope of:		[NRv, PRv, Sens, SRv]
		<1% (flat almost no noticeable slope) or all the area within 30 m of the AA edge is other wetlands.	0	
		2-5%.	0	
		5-30%. >30%.	0	4
55	Cliffs or Steep Banks	>30%. In the AA or within 100 m, there are elevated terrestrial features such as cliffs, talus slopes, stream banks, or excavated pits (but not riprap)	0	Do not include upturned trees as potential den sites. [POL, SBM]
33	Cilis of Steep Baliks	In the zero of within 1 to m, there are executed televation realizes such as callos, and a suppes, surean varies, or exercise pins (our interpretable extend at least 2 m nearly vertically, are unvegetated, and potentially contain crevices or other substrate suitable for nesting or den areas. Enter 1 (yes) or 0 (no).	0	DO NOI INCIDURE UPERS AS POTENTIAL DEL SILES. [FOL, JUNI]
56	New or Expanded Wetland	Human actions within or adjacent to the AA have persistently expanded a naturally occurring wetland or created a wetland where there previously was none (e.g., by excavation, impoundment):		Determine this using historical aerial photography, old maps, soil maps, or permit files as available [C NR, OE, PH, Sens]
		No.	1	
		Yes, and created or expanded 20 - 100 years ago.	0	
		Yes, and created or expanded 3-20 years ago.		4
		Yes, and created or expanded within last 3 years.	0	-
		Yes, but time of origin or expansion unknown. Unknown if new or expanded within 20 years or not.	0	-
57	Burn History	More than 1% of the AA's previously vegetated area:	0	Look for charred soil or stumps (in multiple widely-spaced locations) or ask landowner. [CS, PH, STR]
	Durit History			2 South of Statings (in manages makey Spacea totalions) of ask tandomici. [63, FH, STK
		Burned within past 5 years.	0	4
		Burned 6-10 years ago.	0	4
		Burned 11-30 years ago.	0	
		Burned >30 years ago, or no evidence of a burn and no data.	1	(DLI CTD WOF)
58	Visibility	The maximum percentage of the welland that is visible from the best vantage point on public roads, public parking lots, public buildings, or public maintained trails that intersect, adjoin, or are within 100 m of the AA (select one) is:		[PU, STR, WBFv]
		<25%.		
		25·50%. >50%.	0	4
59	Non-consumptive	Assuming access permission was granted, select ALL statements that are true of the AA as it currently exists:	Ü	[PU, STR]
J7	Uses - Actual or			[10, 310]
	Potential	For an average person, walking is physically possible <u>in</u> (not just near) >5% of the AA during most of the growing season, e.g., free of deep water and dense shrub thickets.	1	
		Maintained roads, parking areas, or foot-traits are within 10 m of the AA, or the AA can be accessed part of the year by boats arriving via contiquous waters.	0	
		Within or near the AA, there is an interpretive center, trails with interpretive signs or brochures, and/or regular guided interpretive tours.	0	
60	Unvisited Core Area	The percentage of the AA almost never visited by humans during an average growing season probably comprises: [Note: Only include the part actually walked or driven (not simply viewed from) with a vehicle or boat. Do not include visitors on traits outside of the AA unless more than half the welfand is visible from the traits and they are within 30 m of the welfand edge. In that case include only the accupied by the		[AM, FAv, FRv, PH, PU, SBM, STR, WBF, WBN]
		trail.]

FieldS form Non-tidal 2

Assessment Area (AA) Results:

Wetland ID: PLW-W-04

Date: 10 September 2020

Observer: Derrick Mitchell

Latitude & Longitude (decimal degrees): 45.166276, -66.205112

Scores will appear below after data are entered in worksheets OF, F, and S. See Manual for definitions and descriptions of how scores were computed.

computed.						
Wetland Functions or Other Attributes:	Function Score (Normalised)	Function Rating	Benefits Score (Normalised)	Benefits Rating	Function Score (raw)	Benefits Score (raw)
Water Storage & Delay (WS)	3.37	Moderate	0.50	Lower	4.33	0.58
Stream Flow Support (SFS)	5.63	Moderate	3.58	Moderate	3.00	2.09
Water Cooling (WC)	0.00	Lower	0.00	Lower	0.00	0.00
Sediment Retention & Stabilisation (SR)	4.80	Moderate	0.37	Lower	6.44	0.22
Phosphorus Retention (PR)	4.68	Higher	0.00	Lower	6.22	0.33
Nitrate Removal & Retention (NR)	1.36	Lower	1.56	Lower	4.67	2.50
Carbon Sequestration (CS)	6.64	Higher			7.43	
Organic Nutrient Export (OE)	6.85	Higher			5.97	
Anadromous Fish Habitat (FA)	0.00	Lower	0.00	Lower	0.00	0.00
Resident Fish Habitat (FR)	0.00	Lower	0.00	Lower	0.00	0.00
Aquatic Invertebrate Habitat (INV)	4.98	Moderate	0.89	Moderate	5.62	1.73
Amphibian & Turtle Habitat (AM)	3.20	Lower	3.16	Moderate	4.99	4.01
Waterbird Feeding Habitat (WBF)	0.00	Lower	0.00	Lower	0.00	0.00
Waterbird Nesting Habitat (WBN)	0.00	Lower	0.00	Lower	0.00	0.00
Songbird, Raptor, & Mammal Habitat (SBM)	6.47	Moderate	6.67	Moderate	5.36	6.67
Pollinator Habitat (POL)	9.42	Higher	6.67	Moderate	7.58	6.67
Native Plant Habitat (PH)	5.78	Moderate	7.53	Higher	5.42	6.54
Public Use & Recognition (PU)			2.18	Lower		1.88
Wetland Sensitivity (Sens)			0.30	Lower		2.29
Wetland Ecological Condition (EC)			4.22	Moderate		6.67
Wetland Stressors (STR) (higher score means more stress)			2.11	Lower		3.04
Summary Ratings for Grouped Functions:						
HYDROLOGIC Group (WS)	5.63	Higher	0.50	Lower	4.33	0.58
WATER QUALITY SUPPORT Group (max+avg/2 of SR, PR, NR, CS)	4.21	Moderate	1.10	Lower	6.81	1.76
AQUATIC SUPPORT Group (max+avg/2 of SFS, INV, OE, WC)	5.60	Moderate	2.54	Moderate	4.81	1.68
AQUATIC HABITAT Group (max+avg/2 of FA, FR, AM, WBF, WBN)	1.92	Lower	1.90	Lower	2.99	2.41
TRANSITION HABITAT Group (max+avg/2 of SBM, PH, POL)	8.32	Higher	7.24	Higher	6.85	6.65
WETLAND CONDITION (EC)			4.22	Moderate		6.67
WETLAND RISK (average of Sensitivity & Stressors)			1.21	Lower		2.66
	NOTE: A coor	o of 0 doop not	moon the fund	tion or honofit i	e abcont from t	ho watland It

NOTE: A score of 0 does not mean the function or benefit is absent from the wetland. It means only that this wetland has a capacity that is equal or less than the lowest-scoring one, for that function or benefit, from among the 98 NB calibration wetlands that were assessed previously.

Cover Page: Basic Description of Assessment	WESP-AC version 2
Site Name:	Burchill Wind Energy Project - PLW-W-06
Investigator Name:	Derrick Mitchell
Date of Field Assessment:	11 October 2019
Nearest Town:	Lorneville (west Saint John), New Brunswick
Latitude (decimal degrees):	45.166706
Longitude (decimal degrees):	-66.208365
Is a map based on a formal on-site wetland delineation available?	Yes
Approximate size of the Assessment Area (AA, in hectares):	0.61
AA as percent of entire wetland (approx.). Attach sketch map if AA is smaller than the entire contiguous wetland.	
What percent (approx.) of the wetland were you able to visit?	10
What percent (approx.) of the AA were you able to visit?	100
Were you able to ask the site owner/manager about any of the questions?	No
Indicate here if you intentionally surveyed for rare plants, calciphile plants, or rare animals	Yes
Have you attended a WESP-AC training session? If so, indicate approximate month & year	Yes, September 2016
How many wetlands have you assessed previously using WESP-AC? (approx.)	100+
Comments about the site or this WESP-AC assessment (attach extra page if desired):	

Form OF (Office). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Conduct an assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the Q (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answering many of the questions below will equire using these online map viewers:

Google Earth Pro: https://www.google.com/earth/download/gep/agree.html
GeoNB: http://www.snb.ca/geonb1/ and http://www.snb.ca/geonb1/e/apps/apps-E.asp

For most wetlands, completing this office data form will require 1-2 hours. For a list of functions to which each question pertains, see bracketed abbreviations in the Definitions/Explanations column. For detailed descriptions of each WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity, STR= Stressors.

#	Indicators	Condition Choices	Data	Definitions/Explanations
OF1	Province	Mark the province in which the AA is located by changing the 0 in the column next to it to a *1". Mark only one.		This determines to which province's calibration wetlands the raw score of any wetland is normalised. In the function and benefits models, it also triggers the automatic exclusion of indicators for which no
		New Brunswick	- 1	spatial data exists in a particular province.
		Nova Scotia	0	
		Prince Edward Island Newfoundland-Labrador	0	4
OF2	Ponded Area Within 1	The area of surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) within 1 km is:	0	"Adjacent" means not separated from the AA by a wide expanse (>50 m) of upland (including roads
	km.	<0.01 hectare (about 10 m x 10 m).	1	>50 m wide). Include ponded areas likely to be hidden by wetland vegetation. If surface water extends beyond 1 km, include only the part within 1 km. Do not include tidal areas. Measure the are:
		0.01 - 0.1 hectare.	0	from aerial imagery using Google Earth Pro (click on Ruler icon in toolbar, then Polygon in pop-up
		0.1 - 1 hectare.	0	menu). With the GeoNB viewer, enable the Wetlands layer, then measure with the Draw & Measure tool after specifying Aerial as the Basemap. However, do not rely entirely on wetland boundaries
		1 to 10 hectares.	0	shown in online wetlands layers. [PH, SBM, WBN]
		10 to 100 hectares.	0	
050	D 1 1W 1 0	>100 hectares.	0	
OF3	Ponded Water & Wetland Within 1 km.	The area of wetlands and surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) within 1 km is:		See definition of adjacent in OF2. If the AA's wetland vegetation extends beyond 1 km, include only the part within 1 km. "Ponded" means not flowing in rivers or streams. [Sens, WBF]
		<0.01 hectare (about 10 m x 10 m).	0	
		0.01 - 0.1 hectare. 0.1 - 1 hectare.	0	4
		1 to 10 hectares.	1	
		10 to 100 hectares.	0	
		>100 hectares.	0	1
OF4	Size of Largest Nearby Vegetated Tract or	The largest vegetated patch or corridor that includes the AA's vegetation plus all adjacent upland vegetation that is not lawn, row crops, neavily grazed lands, conifer plantation is:		See definition of adjacent in OF2. Use Google Earth Pro's polygon ruler (as described above). Exclude conifer plantations only if it is obvious that trees were planted in rows. [AM, PH, SBM, Sens]
	Corridor	<0.01 hectare (about 10 m x 10 m).	0	
		0.01 - 0.1 hectare.	0	
		0.1 - 1 hectare.	0	
		1 to 10 hectares.	0	4
		10 to 100 hectares. 100 to 1000 hectares.	0	1
		>1000 hectares. [This is nearly always the answer in relatively undeveloped landscapes.]	1	
OF5	Distance to Large Vegetated Tract	The minimum distance from the edge of the AA to the edge of the closest <i>vegetated land</i> (but excluding row crops, lawn, conifer plantation) larger than 375 hectares (about 2 km on a side), is:		To measure distance, use Google Earth Pro (Ruler > Line tool). Or use Draw & Measure tool at GeoNB. The 375-ha criterion is from the Fundy Model Forest Project. [AM, PH, POL, SBM, Sens]
		<50 m, and not separated from the 375-ha vegetated area by any width of paved roads, stretches of open water, row crops, bare ground, lawn, or impervious surface. Or the AA itself contains >375 ha of vegetation. [This is often the answer in relatively undeveloped landscapes.]	1	
		<50 m, but completely separated from the 375-ha vegetated area by those features, and AA does not contain >375 ha of vegetation.	0	
		50-500 m, and not separated.	0	
		50-500 m, but separated by those features.	0	
		0.5 - 5 km, and not separated. 0.5 - 5 km, but separated by those features.	0	4
		None of the above (the closest patches or corridors which are that large are >5 km away).	0	1
OF6	Herbaceous Uniqueness	The AA's vegetation cover is >10% herbaceous" but uplands within 5 km have <10% herbaceous cover. If so, enter "3" and continue to	2	For this question only, consider moss to be herbaceous vegetation. Determine the score by viewing
		OF7. If not, consider:		aerial imagery in Google Earth after successively drawing or estimating the boundaries of the buffers of 5 km, 1 km, and 100 m radius focused on the center of the AA. Circles of specified radius can be
		The AA's vegetation cover is >10% herbaceous* but uplands within 1 km have <10% herbaceous cover. If so enter "2" and continue to 0F7. If not, consider: The AA's vegetation cover is >10% herbaceous* but uplands within 100 m of the wetland edge have <10% herbaceous cover. If so, enter		of sixty, Tixty, and too intradus toolsed on the center of the AAC Circles of specified radius can be drawn in Google Earth Pro by clicking on the Ruler icon, then Circle in the pop-up menu. [AMv, PHv, PDLv, SBMv, WBFv, WBNv]
		"1". NOTE: Exclude lawns, row crops, heavily grazed lands, forest, shrublands. Include moss as well as grassilike plants in this use of		. 527,55117,115.17,115.11
057	18/	"herbaceous vegetation"]	2	Construction of the state of th
OF7	Woody Uniqueness	The AA's vegetation cover is >10% woody" but uplands within 5 km have <10% woody cover. If so, enter "3" and continue to OF8. If not, consider: The AA's vegetation is >10% woody" but uplands within 1 km have <10% woody cover. If so enter "2" and continue to OF8. If not,	2	See above. Do not consider conifer plantations to be forest if it is obvious that trees were planted in rows. [AMv, PHv, POLv, SBMv]
		The AA's vegetation is >10% woody* but uplands within 100 m of the wetland edge have <10% woody cover. If so, enter "1"		
		[* NOTE: woody cover = trees & shrubs taller than 1 m.]		
OF8	Local Vegetated Cover Percentage	Draw a 5-km radius circle measured from the center of the AA. Ignoring all permanent water in the circle, the percent of the remaining area that is wooded or unmanaged herbaceous vegetation (NOT lawn, row crops, bare or heavily grazed land, clearcuts, or conifer plantations) is:		In Google Earth, draw the 5 km buffer and then estimate land cover percentages, or do GIS analysis of an appropriate land cover layer. [AM, PH, POL, SBM, Sens]
		<5% of the land.	0]
		5 to 20% of the land. 20 to 60% of the land.	0	-
		20 to 60% or the land. 60 to 90% of the land.	0	1
		>90% of the land. SKIP to OF10.	1	1
OF9	Type of Land Cover	Within the 5-km radius circle, and ignoring all permanent water, the land area that is bare or non-perennial cover is mostly:		[AM, SBM]
	Alteration	Impervious surface, e.g., paved road, parking lot, building, exposed rock.	0	1
		Bare pervious surface, e.g., lawn, recent (<5 yrs ago) clearcut, dirt or gravel road, cropland, landslide, conifer plantation.	0	1
OF10	Distance by Road to	Measured along the maintained road nearest the AA, the distance to the nearest population center is:		"Population center" means a settled area with more than about 5 regularly- inhabited structures per
	Nearest Population Center	<100 m.	0	square kilometer. In Google Earth, click on the Ruler icon, then Path, and draw and measure the route. Or use the GeoNB's Draw & Measure tool> Freehand Line to draw and measure the route to
		100 - 500 m.	0	Settlements (click on Place Names in menu) or other areas not close to mapped settlements but
		0.5- 1 km.	0	which meet the criteria.[FAv, FRv, NRv, PH, PU, SBM, WBFv]
		1 - 5 km.	1	
		>5 km.	0	1

OF11	Distance to Nearest	From the center of the AA, the distance to the nearest maintained public road (dirt or paved) is:	1	Determine this by viewing aerial imagery in Google Earth and measuring with the Ruler>Line tool. Or
OI II	Maintained Road	r r r	0	use the GeoNB's Draw Line tool. [AM, FAv, FRv, NRv, PH, PU, SBM, STR, WBN]
		<10 m. 10 - 25 m.	0	
		25 - 50 m.	0	
		50 - 100 m.	0	
		100 - 500 m.	1	
OF12	Wildlife Access	>500 m.	0	In NID, anable the Metlands laws in CookID (despite its emissions) to show surrounding wetlands and
UF12	wilding Access	Draw a circle of radius of 5 km from the center of the AA. If mammals and amphibians can move from the center of the AA to ALL other separate wetlands and ponds located within the circle without being forced to cross pavement (any width), tawns, bare ground, and/or marrie waters, mark 1 = yes can move to all, 0 = no. Change to blank if there are no other wetlands within 5 km.	0	In NB, enable the Wetlands layer in GeoNB (despite its omissions) to show surrounding wetlands and roads, while estimating the location of the 5 km circle (or draw the 5 km circle in Google Earth Pro using the Circle tool and compane). Evaluate using Google Earth, being cautious to search for roads hidden under forest canopy. [AM, SBM, STR]
OF13	Distance to Ponded	The distance from the AA center to the closest (but separate) ponded water body visible in GoogleEarth imagery is:		In Google Earth, zoom in closely to examine the surrounding landscape for ponds, lakes, and
	Water	<50 m, and not separated by any width of paved roads, stretches of open water, row crops, lawn, bare ground, or impervious surface.	0	wellands that appear to be permanently flooded. Enable the GeoNB viewer's Wetlands layer as well. [AM, PH, SBM, Sens, WBF, WBN]
		<50 m, but completely separated by those features.	0	
		50-500 m, and not separated. 50-500 m, but separated by those features.	0	
		0.5 - 1 km, and not separated.	0	
		0.5 - 1 km, but separated by those features.	0	
		None of the above (the closest patches or corridors that large are >1 km away).	0	
OF14	Distance to Large Ponded Water	The distance from the AA center to the closest (but separate) non-lidal body of water that is ponded during most of the year and is larger than 8 hectares during most of a normal year is: -100 m.	0	Determine this by viewing aerial imagery in Google Earth. [Sens, WBF, WBN]
		100 m - 1 km.	0	
		1-2 km.	0	
		2-5 km.	1	
		5-10 km.	0	
0545	T. I. I. D	>10 km.	0	
UF15	Tidal Proximity	The distance from the AA edge to the closest tidal water body (regardless of its salinity) is:		In Google Earth, measure the distance to the ocean (including Bay of Fundy) or tidal river, whichever is closer. If you need to see how far upriver a river is tidal, see the KMZ file provided with this
		<100 m.	0	calculator for NB (NB Headtide). Points shown in those files are only an approximation, so local
		100 m - 1 km.	0	information if available may be preferable. [FA, WBF]
		1 - 5 km. 5-10 km.	0	
		10-40 km.	0	
		>40 km.	0	
OF16	Upland Edge Contact	Select one: The AA has no upland edge (or upland is <1% of perimeter). The AA is entirely surrounded by (& contiguous with) other wetlands or water.	0	[NR, SBM, Sens]
		1-25% of the AA's perimeter abuts upland (including filled areas). The rest adjoins other wellands or water that is mostly wider than the AA.	0	
		25-50% of the AA's perimeter abuts upland. The rest adjoins other wetlands or water that is mostly wider than the AA.	0	
		50-75% of the AA's perimeter abuts upland. The rest adjoins other wetlands or water that is mostly wider than the AA.	0	
		More than 75% of the AA's perimeter abuts upland. Any remainder adjoins other wetlands or water that is mostly wider than the AA. This will be true for most assessments done with WESP-AC.	1	
OF17		Within 5 km downstream or downslope of the AA (select first true choice):		In the GeoNB map viewer: click on "More" in upper right, then "Flood Information". Expand the menu
	tidal Waters	Maps show Flood Zone or Flood Risk areas and there appears to be infrastructure vulnerable to river flooding not caused by tidal storm surges.	0	under it by clicking on the arrow to its left and the slider to its right. Uncheck the first (Limits of Data) box. Where available, LIDAR imagery can provide finer elevational resolution useful for flood modeling, [WSv]
		Maps show Flood Zone or Flood Risk areas, but infrastructure is absent or is not vulnerable to floods from a non-tidal river. In some cases levees, upriver dams, or other measures may partly limit damage or risk from smaller events.	0	
		Maps do not show Flood Zone or Flood Risk areas (or no such mapping has been done locally) and there appears to be infrastructure vulnerable to river flooding unrelated to tidal storm surges. Maps do not show Flood Zone or Flood Risk areas (or no such mapping has been done locally) and there is no infrastructure vulnerable	0	
OF18	Relative Elevation in	to river flooding unrelated to tidal storm surges. In Google Earth, enable the Terrain layer (tower left menu) and open the NB_Watersheds KMZ file that accompanies this calculator. Then		[FA, NR, Sens, SFSv, WCv, WSv]
	Watershed	determine the AA's approximate elevation (hottom right, NOT the "eye alt"). Then move cursor around to determine the watershed's maximum and minimum elevation. Divide the AA's elevation by the (max-min).	0.23	
	Water Quality Sensitive Watershed or Area	In Google Earth, open the KMZ file NB_Watershed Protected Area which accompanies this calculator. The AA is within such an area. Enter 1= yes, 0= no.	0	If an ACCDC report is available for this AA, it also may contain such information. [NRv]
OF20	Degraded Water Upstream	Sampling indicates a problem with concentrations of metals, hydrocarbons, nutrients, or other substances (excluding bacteria, acidic water, high temperatures) being present at levels harmful to aquatic life or humans, and:		May use existing data, or sample those waters as part of this wetland assessment. "Harmful" should be evaluated with regard to current federal or provincial water quality standards. [AM, FA, FR, NRv,
		The condition is present within the AA.	0	PRv, SRv, STR, WBF, WBN]
		The condition is present in waters within 1 km that flow into the AA, but has not been documented in the AA itself.	0	
		Sampling during both low water periods and times with high runoff (storms, snowmelt) indicates no problems in either the AA or inflowing waters.	0	
		Data are insufficient (no or inadequate sampling within 1 km, or condition exists only at >1 km upstream). This is the situation for nearly all wetlands in this region.	1	
OFo:	Degraded Water	The problem described above is downslope from the AA, and:		May use existing data, or monitor waters as part of this wetland assessment. [NRv, PRv, SRv]
OF21

			<u> </u>	
		Ownership is private and owner does not allow access, or access permission unknown, and not a conservation easement.	0	

Date: 11 October 2019 Site Identifier: PLW-W-06 Investigator: Derrick Mitch

Form F (Field). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Walk for no less than 10 minutes from the wetland edge towards its core, in the part of the AA that is proposed for alteration. If no alteration is proposed, walk in a portion that appears to be most representative of the wetland overall. Walk only where it is safe and legal to do so. Conduct the assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answer these questions primarily based on your onsite observations and interpretations. Do not write in shaded parts of this data form. Answering some questions accurately may require conferring with the landowner or other knowledgable persons and/or reviewing aerial imagery. For most wetlands, completing this field data form will require 1-2 hours on a site. For a list of functions to which each question pertains, see the accompanying Interpretations form. For detailed descriptions of each WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage & Delay, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity, STR= Stressors.

				0.000 5.000
#	Indicators	Condition Choices	Data	Definitions/Explanations
1	Wetland Type	Follow the key below and mark the ONE row that best describes MOST of the vegetated part of the AA:		Ericaceous shrubs are ones in the heather family (Ericaceae). Most have leathery evergreen leaves. They include rhododendron, azalea, swamp laurel, leatherleaf, Labrador tea, and others. Most require
		A. Moss and/or lichen cover more than 25% of the ground. Often dominated by ericaceous shrubs (e.g., Labrador tea) or other acid-tolerant plants (e.g., bog cranberry, pitcher plant, sundew, orchids). Substrate is mostly undecomposed peat. Choose between A1 and A2 and mark the choice with a 1 in their adjoining column. Otherwise go to 8 below.		acidic soil. Although not in the family Ericaceae, sweetgale (<i>Myrica gale</i>) should be counted also. [AM, CS, FA, FR, INV, NR, OE, PH, Sens, SFS, WBF, WBN]
		A1. Surface water is usually absent or, if present, pH is typically <4.5 and conductivity is usually <100 µSicm (<64 ppm TDS). Trees are absent or nearly so. Sedge cover usually sparse or absent but cottongrass and/or lichen cover may be extensive, as well as cloudberry, lingonberry, sheep laurel, and a sedge (Carex rarillora). Wetland surface and surrounding landscape are seldom sloping and wetland often is domed (convex). Inlet and outlet channels are usually absent. If known, pH of peat is <4.0.	0	
		A2. Not A1. Surface water, if present, has pH typically >4.5 and conductivity is usually >100 µS/cm (>64 ppm TDS). Sedge cover is usually extensive, and/or tree and tall shrub cover is extensive. Sometimes at toe of slope or edge of water body. An exit channel is usually present. Wetter than A1 and peat depth may be shallower (<2 m).	1	
		B. Moss and/or lichen cover less than 25% of the ground. Soil is mineral or decomposed organic (muck). Choose between B1 and B2 and mark the choice with a 1 in their adjoining column:		
		B1. Trees and shrubs taller than 1 m comprise more than 25% of the vegetated cover. Surface water is mostly absent or inundates the vegetation only seasonally (e.g., vernal pools or floodplain).	0	
		B2. Not B1. Tree & tall shrubs comprise less than than 25% of the vegetated cover. Vegetation is mostly herbaceous, e.g., catrail, bulrush, burreed, pond lily, horsetail. Surface water may be extensive and fluctuates seasonally, being either persistent or drying up partly or entirely.	0	
		the AA should include all persistent waters in ponds smaller than 8 hectares (-283 m on a side) that are adjacent to the AA. The		
nclud ' adja descn	e the open water part ad cent " is used synonymo bed features along their	the water area of adjacent ponded water larger than 8 ha and adjacent rivers wider than 20 m. Specifically, the AA should jacent to wetland vegetation and equal in width to the average width of that vegetated zone. Throughout this data form, usty with abutting, adjoining, bordering, configuous and means no upland (manmade or natural) completely separates the directly shared edge. Features joined only by a channel are not necessarily considered to be adjacent a large portion of their res do not have to be hydrologically connected in order to be considered adjacent.		
2	Wetland Types - Adjoining or Subordinate	If the AA is smaller than 1 ha, mark all other types that occupy more than 1% of the vegetated AA. If the AA is larger than 1 ha, mark all other types which are within or adjacent to the AA and occupy more than 1 ha, as visible from the AA or as interpreted from aerial imagery. Do not mark again the type marked in F1.		1 hectare is 10,000 sq. m or about 2.5 acres. It could have dimensions of 100 m by 100 m, 1000 m by 10 m, or similar. [AM, INV, SBM, WBF]
		A1.	0	
		A2. B1.	0	
		B2.	0	
3	Woody Height & Form Diversity	Following EACH row below, indicate with a number code the percentage of the living vegetation in the AA which is occupied by that feature (6 if >95%, 5 if 75-95%, 4 if 50-75%, 3 if 25-50%, 2 if 5-25%, 1 if <5%, 0 if none). If the vegetated part of the AA is largely herbaceous (non-woody) vegetation, these percentages should not sum to 100%.		Deciduous shrubs in this region usually include buttonbush, Labrador tea, bayberry (Morella), huckleberry, cranberry, Coudberry, sweetgale, alder, willow, birch, ash, dogwood, and a few others. If you assigned a code of 3 or higher to any of the first four choices and the ground cover beneath the trees/shrubs is <25% moss, then question F1 might be "B1". [CS, INV, NR, PH, POL, SBM, Sens]
		coniferous trees (may include tamarack) taller than 3 m. deciduous trees taller than 3 m.	3	accessinates to second mostly monitoring accessing control of the
		coniferous or ericaceous shrubs or trees 1-3 m tall not directly below the canopy of trees.	2	
		deciduous shrubs or trees 1-3 m tall not directly below the canopy of trees.	2	
		coniferous or ericaceous shrubs <1 m tall not directly below the canopy of taller vegetation. deciduous shrubs or trees <1 m tall (e.g., deciduous seedlings) not directly below the canopy of taller vegetation.	4	
<u>Vote</u> :	If none of top 4 rows in	F3 was marked 2 or greater , SKIP to F9 (N fixers).		
4	Dominance of Most Abundant Shrub	Determine which two woody plant species comprise the greatest portion of the low (<3 m) woody cover . Then choose one:		[PH, POL, SBM, Sens]
	Species	those species together comprise > 50% of such cover.	0	
5	Woody Diameter	those species together do not comprise > 50% of such cover. Mark ALL the types that comprise >5% of the woody canopy cover in the AA or >5% of the wooded areas (if any) along its upland edge		Estimate the diameters at chest height. If small-diameter trees are overlopped (shaded) by larger
	Classes	(perimeter). The edge should include only the trees whose canopies extend into the AA. coniferous, 1-9 cm diameter and >1 m tall.	- 1	ones, visualise a "subcanopy" at the average height of the smaller-dbh trees, to serve as a basis for th minimum 5% canopy requirement in this question. The trees and shrubs need not be wetland species.
		broad-leaved deciduous 1-9 cm diameter and >1 m tall.	1	[AM, CS, POL, SBM, Sens, WBN]
		coniferous, 10-19 cm diameter.	1

40	solated Island	The AA contains (or is part of) an island or beaver lodge within a lake, pond, or river, and is isolated from the shore by water depths >1 m on	0	[WBN]
		all sides during an average June. The island may be solid, or it may be a floating vegetation mat that is sufficiently large and dense to support a waterbird nest.		TO DO MOST
	Duckweed	At some time of the year, mats of algae and/or duckweed are likely to cover >50% of the AA's otherwise-unshaded water surface, or blanket >50% of the underwater substrate. If true, enter "1" in next column. If unitrue or uncertain, enter "0".	0	[EC, PR, WBF]
	Channel Connection & Outflow Duration	The most persistent surface water connection (outlet channel or pipe, dilct, or overbank water exchange) between the AA and a downslope stream network is; [Note: If the AA represents only part of a wetland, answer this according to whichever is the least permanent surface connection: the one between the AA and the rest of the wetland, or the surface connection between the wetland and the downslope stream network.] Persistent (surface water flows out for >9 months/year).	1	Consider the connection regardless of whether the surface water is frozen. The "downslope stream network" could consist of ditches, rivers, ponds, or lakes which eventually connect to the ocean. If this cannot be determined while visiting the AA, consult topographic maps perhaps by viewing these online with Toporama (http://atlas.nrcan.gc.ca/toporama/en/index.html) [CS, FA, FR, NR, OE, PR, Sens, SFS SR, WCv, WS]
		Seasonal (surface water flows out for 14 days to 9 months/year, not necessarily consecutive).	0	
		Temporary (surface water flows out for <14 days, not necessarily consecutive). None but maps show a stream network downslope from the AA and within a distance that is less than the AA's length. SKIP to F47 (pH	0	
		Measurement).		
		No surface water flows out of the wetland except possibly during extreme events (<once (ph="" 10="" a="" an="" ditch,="" f47="" flows="" into="" lacks="" lake="" measurement).<="" only="" or="" or,="" outlet.="" per="" skip="" td="" that="" to="" water="" wetland,="" years).=""><td>0</td><td></td></once>	0	
43	Outflow Confinement	During major runoff events, in the places where surface water exits the AA or connected waters nearby, the water:		"Major runoff events" would include biennial high water caused by storms and/or rapid snowmelt. [CS, NR, OE, PR, Sens, SR, STR, WS]
		Mostly passes through a pipe, culvert, narrowly breached dike, berm, beaver dam, or other partial obstruction (other than natural topography)	0	wk, ue, mk, seils, sk, sik, wsj
		that does not appear to drain the wetland artificially during most of the growing season. Leaves through natural exits (channels or diffuse outflow), not mainly through artificial or temporary features.	1	
		is exported more quickly than usual due to ditches or pipes within the AA or connected to its outlet, or within 10 m of the AA's edge, which drain the wetland artificially, or water is pumped out of the AA.	0	
44	Tributary Channel	At least once annually, surface water from a tributary channel that is >100 m long moves into the AA. Or, surface water from a larger		If inlet tributaries cannot be searched for due to inaccessibility of part of the AA, follow suggestions in
		permanent water body adjacent to the AA spills into the AA. If it enters only via a pipe, that pipe must be fed by a mapped stream or lake further upslope. If no, SKIP to F47 (pH Measurement).	1	F42 above. [NRv, PH, PRv, SRv]
	Input Water Temperature	Based on lack of shade, water source characteristics, or actual temperature measurements, the inflow is likely to be warmer than surface water in the AA during part of most years. Enter 1= yes, 0= no.	1	[WCv]
46	Throughflow	During its travel through the AA at the time of peak annual flow, water arriving in channels: [select only the ONE encountered by most of the		[FA, FR, INV, NR, OE, PR, SR, WS]
	Resistance	incoming water]. Does not bump into many plant stems as it travels through the AA. Nearly all the water continues to travel in unvegetated (often incised)	0	
		channels that have minimal contact with welland vegetation, or through a zone of open water such as an instream pond or lake.	U	
		Bumps into herbaceous vegetation but mostly remains in fairly straight channels.	1	
		Bumps into herbaceous vegetation and mostly spreads throughout, or is in widely meandering, multi-branched, or braided channels.	0	
		Bumps into tree trunks and/or shrub stems but mostly remains in fairly straight channels.	0	
		Bumps into tree trunks and/or shrub stems and follows a fairly indirect path from entrance to exit (meandering, multi-branched, or braided).	0	
47	pH Measurement	The pH in most of the AA's surface water:		Preferably, measure this in larger areas of ponded surface water within the AA, or in streams that have
		Was measured, and is: [enter the reading in the column to the right.]		passed through (not along) most of the AA. Unless surface water is completely absent, do not dig holes or make depressions in peat in order to provide water for this measurement. Avoid measuring near
		Was not measured but surface water is present and is darkly tea-coloured. Or if no surface water, then mosses and plants that indicate peatland (e.g., Labrador tea) are prevalent. Enter "1".	0	roads or in puddles formed only by recent rain. [AM, FA, FR, NR, WBF, PH, PR, Sens, WBF, WBN]
		Neither of above. Enter *1".	- 1	
	TDS and/or Conductivity	The TDS (total dissolved solids) or conductivity off the AA's surface water is: (select the first true row with information):		See above for measurement guidance. [FR, INV, NRv, PH, PRv, Sens]
	Conductivity	TDS is: [Enter the reading in ppm or mg/L in the column to the right, if measured, or answer next row.] Conductivity is [Enter the reading in µS/cm in the column to the right.]		
		Was not measured, but plants that indicate saline conditions cover much of the vegetated AA. Enter "1".	0	
10	D 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1	Neither of above	1	[FA, FR, PH, SBM, Sens, WBF, WBN]
49	Beaver Probability	Use of the AA by beaver during the past 5 years is (select most applicable ONE): Evident from direct observation or presence of gnawed limbs, dams, tracks, dens, lodges, or extensive stands of water-killed trees (snags).	0	II A, I B, F II, JUN, JEIB, WOF, WONJ
			U	
		Likely based on known occurrence in the region and proximity to suitable habitat, which may include: (a) a persistent freshwater wetland, pond, or lake, or a perennial low or mid-gradient (<10%) channel, and (b) a corridor or multiple stands of hardwood trees and shrubs in	1	
		vegetated areas near surface water.		
	0 1 1 01 11	Unlikely because site characteristics above are deficient, and/or this is a settled area or other area where beaver are routinely removed. Select first applicable choice:	0	Adhere to these criteria strictly do not use personal judgment based on fen conditions, pH, or other

ABSTRACT

On August 10 & 11th, 2020, an archaeological pedestrian survey took place at the location of a proposed wind farm near Lorneville, NB. The pedestrian survey was undertaken to identify any extant heritage/archaeological features of significance, any visible significant artifacts or if any potential exists for the presence of buried archaeological sites.

INTRODUCTION

Natural Forces Development LP commissioned the work of an archaeologist to mitigate the potential negative effects of construction activity surrounding the development of a wind farm near Lorneville, New Brunswick (see Figures 1 & 2). In advance of construction activities associated with the wind farm development, the locations of thirteen wind turbines west of Saint John were assessed for the presence of heritage resources and the potential for buried archaeological remains.

PREVIOUS RESEARCH

There are not any previously recorded archaeological sites registered at Archaeological Services New Brunswick within the vicinity of the proposed construction activities in the area surveyed.

The Borden system is a nation-wide, geographically based method for recording sites of archaeological value. In New Brunswick, each Borden block is 10 minutes of latitude by 10 minutes of longitude. Each of these blocks is referred to by a four-letter code, which describes the location of that particular block. Consequently, sites within each Borden block are numbered sequentially in the order in which they are reported. The Borden block that is of concern to this report is BhDm.

METHODS

The information presented in this report was gained through research of relevant documents from Archaeological Services in Fredericton and published materials, including topographic and surficial geology maps & reports, aerial photographs, LiDAR data, and the New Brunswick Register of Historic Places. The field component was conducted using intensive visual inspection through pedestrian surveying. Each turbine area was assessed (see Figure 22).

RESULTS

A review of early and modern aerial photographs (1935 5093/048 & 059) failed to indicate any extant cultural features of interest. The air photos and topographical mapping indicate that the assessed area of the proposed wind farm is sited across an area that has previously been forested with occasional wood lots and rests at an elevation of ~57-73 m asl. As can also be seen from the remotely sensed data (see Figure 3), the project area is comprised of flat areas with several increases in elevation, which are usually bedrock outcrops. The flat areas are often at the lower local elevations and were sometimes wet and classified as a wetland. While bedrock can clearly be seen at the surface in places, there is also a good chance that much of the wet surface can be attributed to the near-surface presence of marine clay. The maximum elevation of the marine transgression is reported to be ~61 m asl (Lohse, 1977), which places much of the project area below or near this level (see Figure 5).

The bedrock geology of the area, the outcrops on which some of the turbines are proposed, is comprised of four different formations – Taylor Island, Saint John Group, Ashburn and the Spruce Lake Tonalite (Barr and White, 2005). Of potential interest is the middle to late Neoproterzoic Ashburn Formation which is reported to contain white to grey fine-grained quartzite. This quartzite may have been used in the production of stone tools. Turbines 6e & 7e are sited in the area resting on the Ashburn Formation deposits.

The notable surficial geology of the project area consists of ice contact and marine shallow water deposits (see Figure 4). In the north of the project area, an elongated ice contact deposit was mapped with at least three recorded gravel pits. Below the topsoil, this deposit is described as fine to coarse-grained sand with fine to coarse gravel to several metres in depth. Turbine 10e is sited near the northern edge of this deposit. In the south of the map area, a couple of marine shallow water deposits were mapped, just south and immediately west of Turbine 2e and north of Turbine 11e. These deposits are also described as fine to coarse-grained sand with fine to coarse gravel to several metres in depth.

With the maximum marine limit at ~61 m asl, it is assumed that early habitation sites may be found in close proximity to this migrating shoreline. Turbines 2e, 5e, 6e, 7e, 8e, 9e, 11e, 12e & 13e are at elevations at or below the 61 m asl level and consequently are considered as holding high potential for the presence of Indigenous archaeological remains.

A few streams were noted within the project area, along with many mapped wetlands, which are known to be great sources of food & resources as well as being ideal locations for human habitation for thousands of years after the last glaciation. Each of these modern and ancient geographical features should be considered as holding high potential for the presence of Indigenous archaeological remains.

No evidence of significant extant structures was visible during the desktop survey or in the field. In the near vicinity of Turbine 1e (~45 m south-east), a garbage dump was noted along an overgrown dirt road. Much of the forest floor is covered in a thick layer of moss, likely obscuring most of the smaller discarded items, but a few abandoned cars were clearly visible. Only one had enough markings visible to be identified as an early 1960s Pontiac Laurentian (see Figure 7). At Turbine 9e, a couple of particularly flat & level areas between bedrock outcrops that would be ideal locations for habitation, providing protection from some of the elements (see Figure 16). Also at Turbine 9e (~45 m north-west), a gap in the bedrock stood out (see Figure 17). While it is possible that this is natural, it also holds the potential to be an Indigenous quarry site. In a couple of other areas at Turbine 9e, veins of quartz were exposed at the surface. Some turbine locations (including Turbine 5e (see Figure 11)), are placed near areas of bedrock outcropping that could be used as rock shelters; ideal areas for habitation during the late Pleistocene and early Holocene. Consequently, these turbine locations meet the criteria for holding high potential for the presence of significant archaeological resources.

Throughout the course of the pedestrian survey, there were not any culturally significant extant or exposed features/artifacts identified. If any change to the proposed footprint of this project is anticipated, then consultation with a permitted archaeologist should occur to ensure a minimal amount of damage to any buried heritage that may be present.

CONCLUSIONS & RECOMMENDATIONS

On August 10th & 11th, 2020, an archaeological pedestrian survey took place at a proposed wind farm west of Lorneville, NB. The assessment of this area resulted in the failure to identify any evidence of significant past human use at the locations of the proposed 13 turbines locations. However, nine turbine locations (Turbines 2e, 5e, 6e, 7e, 8e, 9e, 11e, 12e & 13e) rest in areas that are considered to hold high potential for significant archaeological remains. The age of the Pontiac Laurentian near Turbine 1e falls outside of the range considered significant enough to record as an archaeological site (75+ years), the other two or more vehicles may reach that threshold, but more work to uncover and identify those will be needed.

Due to their proximity to the former marine shoreline, Turbines 2e, 5e, 6e, 7e, 8e, 9e, 11e, 12e & 13e should be considered as holding high potential for the presence of early postglacial archaeology. Following the *Guidelines* (2012), archaeological test pits should be excavated on a 5 m grid anywhere ground-disturbing activities (removing tree stumps, use of heavy equipment etc) will occur as follows: (c) extends within 50 metres of the banks or shores of a current or former body of water (i.e., river, lake, bay, etc.) – for areas between 50-80 metres from current or former body of water see: Medium Potential (a 10 m grid). Initially, it might be suitable to excavate test pits along a transect (in a N/S direction) at each of these locations, to better understand the surficial geology and the potential for early human habitation and to narrow focus. Additionally, minimising the amount of ground disturbing activity will limit the amount of effort required to identify the presence/absence of archaeology (i.e. only clear area for turbine pad, leave stumps beyond).

APPENDIX

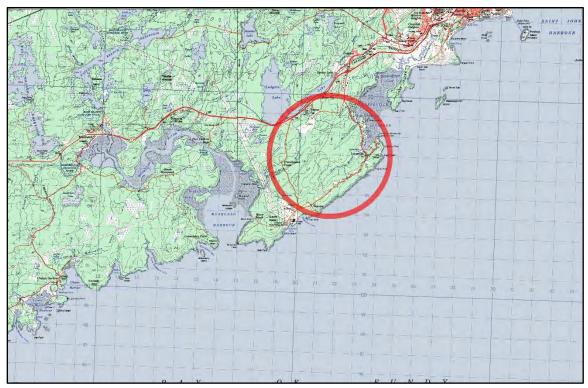

Figure 1: Approximate location of the proposed wind farm. (21 G/01)

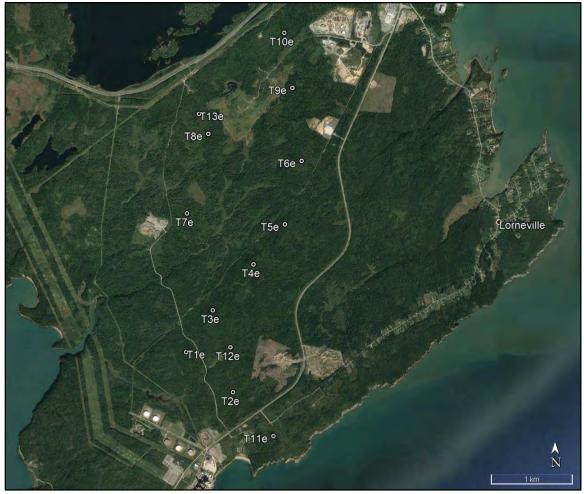

Figure 2: Project area with locations of turbines.

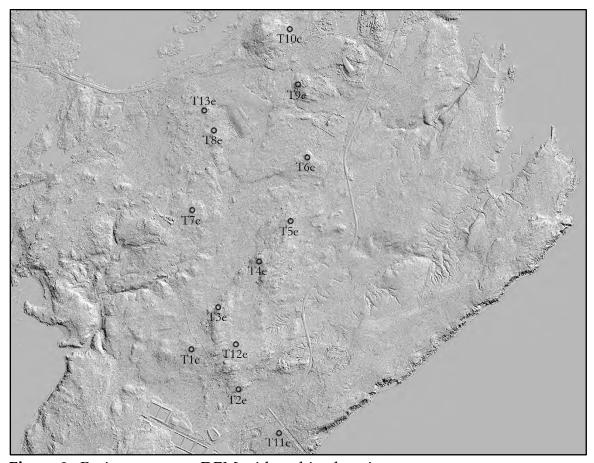

Figure 3: Project area on a DEM with turbine locations.

Figure 4: Project area on a satellite image with turbine locations & geology. The southern deposits are 'marine shallow water deposits', and the northern deposit is a 'ice contact stratified drift'.

Figure 5: Project area on a satellite image with turbine locations and 60 m+ elevations.

Figure 6: Proposed placement for Turbine 1e.

Figure 7: An early 1960's Pontiac Laurentian in a dump ~45 m south-east of T1e.

Figure 8: Proposed placement for Turbine 2e.

Figure 9: Proposed placement for Turbine 3e.

Figure 10: Proposed placement for Turbine 4e.

Figure 11: Proposed placement for Turbine 5e.

Figure 12: Proposed placement for Turbine 6e.

Figure 13: Proposed placement for Turbine 7e.

Figure 14: Proposed placement for Turbine 8e.

Figure 15: Proposed placement for Turbine 9e.

Figure 16: A flat, level area between bedrock outcrops near Turbine 9e.

Figure 17: An opening in the bedrock near Turbine 9e.

Figure 18: Proposed placement for Turbine 10e.

Figure 19: Proposed placement for Turbine 11e.

Figure 20: Proposed placement for Turbine 12e.

Figure 21: Proposed placement for Turbine 13e.

Figure 22: Turbines and tracklog on a satellite image.

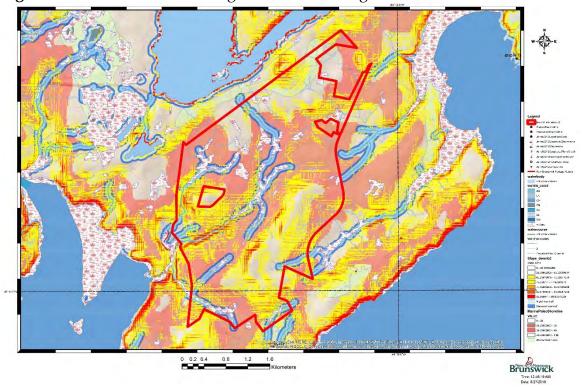

Figure 23: The required predictive model purchased from the Province.
