58	Visibility	The maximum percentage of the wetland that is visible from the best vantage point on public roads, public parking lots, public buildings, or public maintained trails that intersect, adjoin, or are within 100 m of the AA (select one) is:		[PU, STR, WBFv]
		<25%.	1	
		25-50%.	0	
		>50%.	0	
59	Non-consumptive	Assuming access permission was granted, select ALL statements that are true of the AA as it currently exists:		[PU, STR]
	Uses - Actual or Potential	For an average person, walking is physically possible in (not just near) >5% of the AA during most of the growing season, e.g., free of deep	1	
	rotential	water and dense shrub thickets. Maintained roads, parking areas, or foot-trails are within 10 m of the AA, or the AA can be accessed part of the year by boats arriving via	0	
		contiguous waters. Within or near the AA, there is an interpretive center, trails with interpretive signs or brochures, and/or regular guided interpretive tours.	0	
60	Unvisited Core Area	The percentage of the AA almost never visited by humans during an average growing season probably comprises: [Note: Only include the		[AM, FAv, FRv, PH, PU, SBM, STR, WBF, WBN]
	Onvision Coronica	part actually walked or driven (not simply viewed from) with a vehicle or boat. Do not include visitors on trails outside of the AA unless more		, , , , , , , , , , , , , , , , , , , ,
		than half the wetland is visible from the trails and they are within 30 m of the wetland edge. In that case include only the area occupied by the trail.]		
		<5% and no inhabited building is within 100 m of the AA.	0	
		<5% and inhabited building is within 100 m of the AA.	0	
		5-50% and no inhabited building is within 100 m of the AA.	0	
		5-50% and inhabited building is within 100 m of the AA.	0	1
		50-95%, with or without inhabited building nearby.	0	1
		>95% of the AA with or without inhabited building nearby.	1	
61	Frequently Visited Area	The part of the AA visited by humans almost daily for several weeks during an average growing season probably comprises: [See note above.]		[AM, PH, PU, SBM, STR, WBF, WBN]
		<5%. If F60 was answered ">95%" (mostly never visited), SKIP to F64.	1	
		5-50%.	0	
		50-95%.	0	
		>95% of the AA.	0	
62	BMP - Soils	Boardwalks, paved trails, fences or other infrastructure and/or well-enforced regulations appear to effectively prevent visitors from walking on soil within nearly all of the AA when the soil is unfrozen. Enter "1" if true.	0	[PH, PU]
63	BMP - Wildlife Protection	Fences, observation blinds, platforms, paved trails, exclusion periods, and/or well-enforced prohibitions on motorised boats, off-leash pels, and off road vehicles appear to effectively exclude or divert visitors and their pets from the AA at critical times in order to minimize disturbance of wildlife (except during hunting seasons). Enter "1" if true.	0	[AM, PU, WBF, WBN]
64	Consumptive Uses	Recent evidence was found within the AA of the following potentially-sustainable consumptive uses. Select ALL that apply.		[FAv, FRv, WBFv]
	(Provisioning Services)	Low-impact commercial timber harvest (e.g., selective thinning).	0	
		Commercial or traditional-use harvesting of native plants, their fruits, or mushrooms.	0	1
		Waterfowl hunting.	0	1
		Fishing.	0	1
		Trapping of furbearers.	0]
		None of the above.	1	
65	Domestic Wells	The closest wells or water bodies that currently provide drinking water are:		[NRv]
		Within 0-100 m. of the AA.	0	
		100-500 m. away.	0	1
		>500 m. away, or no information.	1	1
,				(DLL DD)
66	Calcareous Fen	The AA is, or is part of, a calcareous fen. See the Plants_Calcar worksheet in the accompanying SuppInfo file for list of plant indicators	0	[PH, PR]

essor (S) Data Form for Non-Tid	al Wetlands. WESP-AC for New B	runswick. Version 2.						
Aberrant Timing of Water Inputs								
In the last column, place a check mark next to any item that is lik	ely to have caused the timing of water inputs (but not necessarily their	r volume) to shift by hours, days, or weeks, becoming either more i	muted (smaller or less frequent peaks spread over longer time:					
more temporal homogeneity of flow or water levels) or more flashy (larger or more frequent spikes but over shorter times). [FA, FR, INV, PH, STR]								
Stormwater from impervious surfaces that drains directly to the								
Water subsidies from wastewater effluent, septic system leakag								
Regular removal of surface or groundwater for irrigation or other	•							
	g water body, or other control structure at water entry points that regu							
	rom the wetland that interferes with surface or subsurface flow in/ou	t of the AA (e.g., road fill, wellpads, pipelines).						
Excavation within the wetland, e.g., dugout, artificial pond, dead	-end ditch.							
Artificial drains or ditches in or near the wetland.								
Accelerated downcutting or channelization of an adjacent or inte	ernal channel (incised below the historical water table level).							
Logging within the wetland.								
Subsidence or compaction of the wetland's substrate as a result								
Straightening, ditching, dredging, and/or lining of tributary chann								
	below, assign points. However, if you believe the checked items had n ion if the checked items never occurred or were no longer present.	no measurable ettect on the timing of water conditions in any part of	r tne AA, tnen leave the "U's" tor the scores in the following row					
Services and the current container must the contain	Severe (3 points)	Medium (2 points)	Mild (1 point)					
Spatial extent of timing shift within the wetland:	>95% of wetland.	5-95% of wetland.	<5% of wetland.					
When most of the timing shift began:	<3 yrs ago.	3-9 yrs ago.	10-100 yrs ago.					
	past 10 years, and only for the part of the wetland that experiences th	, ,	10 100 jib ugo.					
Input timing now vs. previously:	Shift of weeks.	Shift of days.	Shift of hours or minutes.					
Flashiness or muting:	Became very flashy or controlled.	Intermediate.	Became mildly flashy or controlled.

FieldS form Non-tidal 1

	buting Area							
In the last column, place a check mark next to any item present in	the CA that is likely to have elevated the load of waterborne or wind	borne sediment reaching the wetland from its CA. [FA, FR, INV,	PH, SRv, STR]					
Erosion from plowed fields, fill, timber harvest, dirt roads, vegetation clearing, fires.								
Erosion from construction, in-channel machinery in the CA.								
Erosion from off-road vehicles in the CA.								
Erosion from livestock or foot traffic in the CA.								
Stormwater or wastewater effluent.								
Sediment from road sanding, gravel mining, other mining, oil/ ga	s extraction.							
Accelerated channel downcutting or headcutting of tributaries du	e to altered land use.							
Other human-related disturbances within the CA.								
If any items were checked above, then for each row of the table below, assign points (3, 2, or 1 as shown in header) in the last column. However, if you believe the checked items did not cumulatively add significantly more sediment or suspended solids to the AA, then leave the "Us" for the scores in the following rows. To estimate effects, contrast the current condition with the condition with the cendition if the checked items never occurred or were no longer present.								
	Severe (3 points)	Medium (2 points)	Mild (1 point)					
Erosion in CA:	Extensive evidence, high intensity.*	Potentially (based on high-intensity* land use) or scattered evidence.	Potentially (based on low-intensity* land use) with little or no direct evidence.					
Recentness of significant soil disturbance in the CA:	Current & ongoing.	1-12 months ago.	>1 yr ago.					
Duration of sediment inputs to the wetland:	Frequent and year-round.	Frequent but mostly seasonal.	Infrequent & during high runoff events mainly.					
AA proximity to actual or potential sources:	0 - 15 m.	15-100 m.	In more distant part of contributing area.					
* high-intensity= extensive off-road vehicle use, plowing, grading,	excavation, erosion with or without veg removal; low-intensity= veg	removal only with little or no apparent erosion or disturbance of	Sum=	0

FieldS form Non-tidal 2

Assessment Area (AA) Results:

Wetland ID: FC-Trib2-W-01

Date: 14 October 2019 Observer: Derrick Mitchell

Latitude & Longitude (decimal degrees): 45.193500, -66.207134

Scores will appear below after data are entered in worksheets OF, F, and S. See Manual for definitions and descriptions of how scores were computed.

computed.						
Wetland Functions or Other Attributes:	Function Score (Normalised)	Function Rating	Benefits Score (Normalised)	Benefits Rating	Function Score (raw)	Benefits Score (raw)
Water Storage & Delay (WS)	2.64	Moderate	0.39	Lower	3.76	0.48
Stream Flow Support (SFS)	2.92	Lower	3.53	Moderate	1.56	2.06
Water Cooling (WC)	8.40	Higher	1.28	Lower	5.60	0.77
Sediment Retention & Stabilisation (SR)	2.00	Moderate	1.56	Lower	4.53	0.94
Phosphorus Retention (PR)	3.76	Moderate	1.09	Lower	5.57	1.32
Nitrate Removal & Retention (NR)	2.30	Moderate	4.56	Moderate	5.25	5.17
Carbon Sequestration (CS)	4.82	Moderate			6.64	
Organic Nutrient Export (OE)	6.31	Higher			5.68	
Anadromous Fish Habitat (FA)	0.00	Lower	0.00	Lower	0.00	0.00
Resident Fish Habitat (FR)	0.00	Lower	0.00	Lower	0.00	0.00
Aquatic Invertebrate Habitat (INV)	7.93	Higher	5.26	Moderate	6.66	4.08
Amphibian & Turtle Habitat (AM)	4.85	Moderate	5.58	Moderate	5.86	5.48
Waterbird Feeding Habitat (WBF)	7.62	Higher	2.50	Moderate	6.07	2.50
Waterbird Nesting Habitat (WBN)	5.49	Higher	2.50	Moderate	4.69	2.50
Songbird, Raptor, & Mammal Habitat (SBM)	9.48	Higher	2.50	Lower	7.86	2.50
Pollinator Habitat (POL)	10.00	Higher	0.00	Lower	8.35	0.00
Native Plant Habitat (PH)	8.65	Higher	6.23	Moderate	6.57	5.40
Public Use & Recognition (PU)			2.23	Lower		1.92
Wetland Sensitivity (Sens)			0.08	Lower		2.23
Wetland Ecological Condition (EC)			7.59	Higher		8.61
Wetland Stressors (STR) (higher score means more stress)			3.14	Moderate		3.41
Summary Ratings for Grouped Functions:						
HYDROLOGIC Group (WS)	2.92	Moderate	0.39	Lower	3.76	0.48
WATER QUALITY SUPPORT Group (max+avg/2 of SR, PR, NR, CS)	3.23	Moderate	3.48	Lower	6.07	3.82
AQUATIC SUPPORT Group (max+avg/2 of SFS, INV, OE, WC)	7.39	Higher	4.31	Moderate	5.77	3.19
AQUATIC HABITAT Group (max+avg/2 of FA, FR, AM, WBF, WBN)	5.61	Moderate	3.85	Moderate	4.69	3.79
TRANSITION HABITAT Group (max+avg/2 of SBM, PH, POL)	9.69	Higher	4.57	Moderate	7.97	4.02
WETLAND CONDITION (EC)			7.59	Higher		8.61
WETLAND RISK (average of Sensitivity & Stressors)			1.61	Lower		2.82
	NOTE: A coor	a of 0 does not	moon the fune	tion or bonofit i	a abaant from t	ho wotland It

NOTE: A score of 0 does not mean the function or benefit is absent from the wetland. It means only that this wetland has a capacity that is equal or less than the lowest-scoring one, for that function or benefit, from among the 98 NB calibration wetlands that were assessed previously.

Cover Page: Basic Description of Assessment	WESP-AC version 2
Site Name:	Burchill Wind Energy Project - MB-Trib2-W-01
Investigator Name:	Derrick Mitchell
Date of Field Assessment:	11 October 2019
Nearest Town:	Lorneville (west Saint John), New Brunswick
Latitude (decimal degrees):	45.172643
Longitude (decimal degrees):	-66.196268
Is a map based on a formal on-site wetland delineation available?	Yes
Approximate size of the Assessment Area (AA, in hectares):	9.8
AA as percent of entire wetland (approx.). Attach sketch map if AA is smaller than the entire contiguous wetland.	40
What percent (approx.) of the wetland were you able to visit?	40
What percent (approx.) of the AA were you able to visit?	
Were you able to ask the site owner/manager about any of the questions?	No
Indicate here if you intentionally surveyed for rare plants, calciphile plants, or rare animals	
Have you attended a WESP-AC training session? If so, indicate approximate month & year	Yes, September 2016
How many wetlands have you assessed previously using WESP-AC? (approx.)	100+
Comments about the site or this WESP-AC assessment (attach extra page if desired):	

Form OF (Office). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Conduct an assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the O (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answering many of the questions below will equire using these online map viewers:

Google Earth Pro: https://www.google.com/earth/download/gep/agree.html
GeoNB: http://www.snb.ca/geonb1/ and http://www.snb.ca/geonb1/e/apps/apps-E.asp

For most wetlands, completing this office data form will require 1-2 hours. For a list of functions to which each question pertains, see bracketed abbreviations in the Definitions/Explanations column. For detailed descriptions of each WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity, STR= Stressors.

#	Indicators	Condition Choices	Data	Definitions/Explanations
OF1	Province	Mark the province in which the AA is located by changing the 0 in the column next to it to a *1". Mark only one.		This determines to which province's calibration wetlands the raw score of any wetland is normalised. In the function and benefits models, it also triggers the automatic exclusion of indicators for which no
		New Brunswick	1	spatial data exists in a particular province.
		Nova Scotia	0	
		Prince Edward Island Newfoundland-Labrador	0	4
OF2	Ponded Area Within 1 km.	The area of surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) within 1 km is:	U	"Adjacent" means not separated from the AA by a wide expanse (>50 m) of upland (including roads >50 m wide). Include ponded areas likely to be hidden by wetland vegetation. If surface water
		<0.01 hectare (about 10 m x 10 m).	1	extends beyond 1 km, include only the part within 1 km. Do not include tidal areas. Measure the area
		0.01 - 0.1 hectare.	0	from aerial imagery using Google Earth Pro (click on Ruler icon in toolbar, then Polygon in pop-up
		0.1 - 1 hectare.	0	menu). With the GeoNB viewer, enable the Wetlands layer, then measure with the Draw & Measure tool after specifying Aerial as the Basemap. However, do not rely entirely on wetland boundaries
		1 to 10 hectares.	0	shown in online wetlands layers. [PH, SBM, WBN]
		10 to 100 hectares.	0	
OF3	Ponded Water &	>100 hectares. The area of wetlands and curface water pended during most of the growing season that is both (1) in as ediscont to the AA and (2) within	0	See definition of adjacent in OF2. If the AA's wetland vegetation extends beyond 1 km, include only
UF3	Wetland Within 1 km.	The area of wetlands and surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) within 1 km is:	0	the part within 1 km. "Ponded" means not flowing in rivers or streams. [Sens, WBF]
		<0.01 hectare (about 10 m x 10 m). 0.01 - 0.1 hectare.	0	-
		0.0 i - 0. i nectare. 0.1 - 1 hectare.	0	1
		1 to 10 hectares.	0	1
		10 to 100 hectares.	0	1
		>100 hectares.	- 1	
OF4	Size of Largest Nearby Vegetated Tract or	The largest vegetated patch or corridor that includes the AA's vegetation plus all adjacent upland vegetation that is not lawn, row crops, heavily grazed lands, conifer plantation is:		See definition of adjacent in OF2. Use Google Earth Pro's polygon ruler (as described above). Exclude conifer plantations only if it is obvious that trees were planted in rows. [AM, PH, SBM, Sens]
	Corridor	<0.01 hectare (about 10 m x 10 m).	0	
		0.01 - 0.1 hectare.	0	
		0.1 - 1 hectare. 1 to 10 hectares	0	-
		1 to 10 nectares.	0	1
		100 to 1000 hectares.	1	
		>1000 hectares. [This is nearly always the answer in relatively undeveloped landscapes.]	0	
OF5	Distance to Large Vegetated Tract	The minimum distance from the edge of the AA to the edge of the closest vegetated land (but excluding row crops, lawn, conifer plantation) larger than 375 hectares (about 2 km on a side), is:		To measure distance, use Google Earth Pro (Ruler > Line tool). Or use Draw & Measure tool at GeoNB. The 375-ha criterion is from the Fundy Model Forest Project. [AM, PH, POL, SBM, Sens]
		c50 m, and not separated from the 375-ha vegetated area by any width of paved roads, stretches of open water, row crops, bare ground, lawn, or impervious surface. Or the AA liself contains >375 ha of vegetation, [This is often the answer in relatively undeveloped landscapes.]	1	
		<50 m, but completely separated from the 375-ha vegetated area by those features, and AA does not contain >375 ha of vegetation.	0	
		50-500 m, and not separated.	0	
		50-500 m, but separated by those features.	0	
		0.5 - 5 km, and not separated. 0.5 - 5 km, but separated by those features.	0	-
		None of the above (the closest patches or corridors which are that large are >5 km away).	0	-
OF6	Herbaceous Uniqueness	The AA's vegetation cover is >10% herbaceous* but uplands within 5 km have <10% herbaceous cover. If so, enter "3" and continue to	0	For this question only, consider moss to be herbaceous vegetation. Determine the score by viewing
		OF7. If not, consider:		aerial imagery in Google Earth after successively drawing or estimating the boundaries of the buffers of 5 km, 1 km, and 100 m radius focused on the center of the AA. Circles of specified radius can be
		The AA's vegetation cover is >10% herbaceous* but uplands within 1 km have <10% herbaceous cover. If so enter *2* and continue to OF7. If not, consider:		drawn in Google Earth Pro by clicking on the Ruler icon, then Circle in the pop-up menu. [AMv, PHv,
		The AA's vegetation cover is >10% herbaceous* but uplands within 100 m of the wetland edge have <10% herbaceous cover. If so, enter "1".		POLv, SBMv, WBFv, WBNv]
		[* NOTE: Exclude lawns, row crops, heavily grazed lands, forest, shrublands. Include moss as well as grasslike plants in this use of "herbaceous vegetation"]		
OF7	Woody Uniqueness	The AA's vegetation cover is >10% woody* but uplands within 5 km have <10% woody cover. If so, enter "3" and continue to OF8. If not, consider:	0	See above. Do not consider conifer plantations to be forest if it is obvious that trees were planted in rows. [AMv, PHv, POLv, SBMv]
		The AA's vegetation is >10% woody* but uplands within 1 km have <10% woody cover. If so enter *2* and continue to OF8. If not, consider:		
		The AATs vegetation is >10% woody* but uplands within 100 m of the wetland edge have <10% woody cover. If so, enter "1" [* NOTE: woody cover = trees & shrubs taller than 1 m.]		
OF8	Local Vegetated Cover Percentage	Draw a 5-km radius circle measured from the center of the AA. Ignoring all permanent water in the circle, the percent of the remaining area that is wooded or unmanaged herbaceous vegetation (NOT lawn, row crops, bare or heavily grazed land, clearcuts, or conifer plantations)		In Google Earth, draw the 5 km buffer and then estimate land cover percentages, or do GIS analysis of an appropriate land cover layer. JAM, PH, POL, SBM, Sens
		is:		
		<5% of the land.	0	
		5 to 20% of the land.	0	4
		20 to 60% of the land. 60 to 90% of the land.	0	4
		>90% of the land. SKIP to OF10.	1	
OF9	Type of Land Cover	Within the 5-km radius circle, and ignoring all permanent water, the land area that is bare or non-perennial cover is mostly:		[AM, SBM]
	Alteration	Impervious surface, e.g., paved road, parking lot, building, exposed rock.	0	
		Bare pervious surface, e.g., lawn, recent (<5 yrs ago) clearcut, dirt or gravel road, cropland, landslide, conifer plantation.	0	1
OF10	Distance by Road to	Measured along the maintained road nearest the AA, the distance to the nearest population center is:		"Population center" means a settled area with more than about 5 regularly- inhabited structures per
	Nearest Population	<100 m.	0	square kilometer. In Google Earth, click on the Ruler icon, then Path, and draw and measure the
	Center	< 100 m. 100 - 500 m.		route. Or use the GeoNB's Draw & Measure tool> Freehand Line to draw and measure the route to
		100 - 500 m. 0.5- 1 km.	0	Settlements (click on Place Names in menu) or other areas not close to mapped settlements but which meet the criteria.[FAv, FRv, NRv, PH, PU, SBM, WBFv]

OF11	Distance to Nearest	From the center of the AA, the distance to the nearest maintained public road (dirt or paved) is:		Determine this by viewing aerial imagery in Google Earth and measuring with the Ruler>Line tool. Or
	Maintained Road	<10 m.	0	use the GeoNB's Draw Line tool. [AM, FAv, FRv, NRv, PH, PU, SBM, STR, WBN]
		10 - 25 m.	0	
		25 - 50 m.	0	1
		50 - 100 m.	1	
		100 - 500 m.	0	
OF12	Wildlife Access	>500 m. Draw a circle of radius of 5 km from the center of the AA. If mammals and amphibians can move from the center of the AA to ALL other	0	In NB, enable the Wetlands layer in GeoNB (despite its omissions) to show surrounding wetlands and
		separate wetlands and ponds located within the circle without being forced to cross pavement (any width), lawns, bare ground, and/or marine waters, mark 1= yes can move to all, 0= no. Change to blank if there are no other wetlands within 5 km.	0	roads, while estimating the location of the 5 km circle (or draw the 5 km circle in Google Earth Pro using the Circle tool and compare). Evaluate using Google Earth, being cautious to search for roads hidden under forest canopy. [AM, SBM, STR]
OF13	Distance to Ponded	The distance from the AA center to the closest (but separate) ponded water body visible in GoogleEarth imagery is:		In Google Earth, zoom in closely to examine the surrounding landscape for ponds, lakes, and
	Water	<50 m, and not separated by any width of paved roads, stretches of open water, row crops, lawn, bare ground, or impervious surface.	0	wetlands that appear to be permanently flooded. Enable the GeoNB viewer's Wetlands layer as well. [AM, PH, SBM, Sens, WBF, WBN]
		<50 m, but completely separated by those features. 50-500 m, and not separated.	0	
		50-500 m, and not separated. 50-500 m, but separated by those features.	1	
		0.5 - 1 km, and not separated.	0	
		0.5 - 1 km, but separated by those features.	0	
OF14	Distance to Large	None of the above (the closest patches or corridors that large are >1 km away). The distance from the AA center to the closest (but separate) non-lidal body of water that is ponded during most of the year and is larger.	0	Determine this by viewing aerial imagery in Google Earth. [Sens, WBF, WBN]
01 14	Ponded Water	The usance from the Processes of the closest (our separate) normal body or water that is portion during frost of the year and is eigent than 8 hectares during most of a normal year is: <100 m.	0	Determine this by viewing aerial imagery in Google Latif. [Sells, WDF, WDF]
		100 m - 1 km.	0	1
		1 -2 km.	0	
		2.5 km.	1	
		5-10 km. >10 km.	0	-
OF15	Tidal Proximity	The distance from the AA edge to the closest tidal water body (regardless of its salinity) is:	Ü	In Google Earth, measure the distance to the ocean (including Bay of Fundy) or tidal river, whichever
	,	<100 m.	0	is closer. If you need to see how far upriver a river is tidal, see the KMZ file provided with this
		100 m - 1 km.	1	calculator for NB (NB Headtide). Points shown in those files are only an approximation, so local information if available may be preferable. [FA, WBF]
		1 - 5 km.	0	
		5-10 km.	0	
		10-40 km. >40 km.	0	-
OF16	Upland Edge Contact	Select one:	0	[NR, SBM, Sens]
	. 5	The AA has no upland edge (or upland is <1% of perimeter). The AA is entirely surrounded by (& contiguous with) other wetlands or water.	0	
		1-25% of the AA's perimeter abuts upland (including filled areas). The rest adjoins other wetlands or water that is mostly wider than the AA.	0	
		25-50% of the AA's perimeter abuts upland. The rest adjoins other wetlands or water that is mostly wider than the AA.	0	
		50-75% of the AA's perimeter abuts upland. The rest adjoins other wetlands or water that is mostly wider than the AA.	1	
		More than 75% of the AA's perimeter abuts upland. Any remainder adjoins other wellands or water that is mostly wider than the AA. This will be true for most assessments done with WESP-AC.	0	
OF17		Within 5 km downstream or downslope of the AA (select first true choice):		In the GeoNB map viewer: click on "More" in upper right, then "Flood Information". Expand the menu
	tidal Waters	Maps show Flood Zone or Flood Risk areas and there appears to be infrastructure vulnerable to river flooding not caused by tidal sform surges.	0	under it by clicking on the arrow to its left and the slider to its right. Uncheck the first (Limits of Data) box. Where available, LiDAR imagery can provide finer elevational resolution useful for flood modeling, (WSV)
		Maps show Flood Zone or Flood Risk areas, but infrastructure is absent or is not vulnerable to floods from a non-tidal river. In some cases levees, upriver dams, or other measures may partly limit damage or risk from smaller events.	0	mounty, (1004)
		Maps do not show Flood Zone or Flood Risk areas (or no such mapping has been done locally) and there appears to be infrastructure vulnerable to river flooding unrelated to tidal storm surges. Maps do not show Flood Zone or Flood Risk areas (or no such mapping has been done locally) and there is no infrastructure vulnerable	0	
OF18	Relative Elevation in	to river flooding unrelated to tidal storm surges. In Google Earth, enable the Terrain layer (lower left menu) and open the NB_Watersheds KMZ file that accompanies this calculator. Then		[FA, NR, Sens, SFSv, WCv, WSv]
	Watershed	determine the AA's approximate elevation (bottom right, NOT the "eye ait"). Then move cursor around to determine the watershed's maximum and minimum elevation. Divide the AA's elevation by the (max-min).	0.55	
	Water Quality Sensitive Watershed or Area	In Google Earth, open the KMZ file NB_Watershed Protected Area which accompanies this calculator. The AA is within such an area. Enter 1= yes, 0= no.	0	If an ACCDC report is available for this AA, it also may contain such information. [NRv]
OF20	Degraded Water Upstream	Sampling indicates a problem with concentrations of metals, hydrocarbons, nutrients, or other substances (excluding bacteria, acidic water, high temperatures) being present at levels harmful to aquatic life or humans, and:		May use existing data, or sample those waters as part of this wetland assessment. "Harmful" should be evaluated with regard to current federal or provincial water quality standards. [AM, FA, FR, NRv,
		The condition is present within the AA.	0	PRv, SRv, STR, WBF, WBN]
		The condition is present in waters within 1 km that flow into the AA, but has not been documented in the AA itself.	0	
		Sampling during both low water periods and times with high runoff (storms, snowmelt) indicates no problems in either the AA or inflowing waters.	0	
		waters. Data are insufficient (no or inadequate sampling within 1 km, or condition exists only at >1 km upstream). This is the situation for nearly all wetlands in this region.	1	
	Degraded Water	The problem described above is downslope from the AA, and:		May use existing data, or monitor waters as part of this wetland assessment. [NRv, PRv, SRv]
	Downstream	The condition is present within 1 km downslope and connected to the AA by a channel.	0	
		The condition is present within 5 km downslope and connected to the AA by a channel, or within 1 km but not connected to the AA by a channel.	0	
		Sampling during both low water periods and times with high runoff (storms, snowmell) indicates no problems in either the AA or inflowing waters. National States of the AA or inflowing water periods and times with high runoff (storms, snowmell) indicates no problems in either the AA or inflowing waters.	0	
0522	M-H	Data are insufficient (no or inadequate sampling within 1 km, or condition exists only at >1 km upstream). This is the situation for nearly all wetlands in this region.		Towards and the state of Conde (Towards)
OF22	Wetland as a % of Its Contributing Area (Catchment)	From a topographic map and field observations, estimate the approximate boundaries of the catchment (CA) of the entire wetland of which the AI may be only a part. Then adjust those boundaries if necessary based on your field observations of the surrounding man, and/or by using procedures described in the Manual. Divide the area of the wetland (not just the AA) by the approximate area of its catchment excluding the area of the wetland itself. When doing the calculation, if ponded water is adjacent to the wetland, include that in the wetlands area. The result its:		Topographic maps may be viewed online at the National Atlas of Canada (Toporama): http://atlas.gc.ca/toporama/en/index.html [NR, PR, Sens, SR, WS]
		<0.01, or catchment size unknown due to stormwater pipes that collect water from an indeterminate area.	0	
		0.01 to 0.1. 0.1 to 1.	0	
		 10.1 to 1. 11 (wetland is larger than its catchment (e.g., wetland with flat surrounding terrain and no inlet, or is entirely isolated by dikes, or is a raised. 	0	1
OF23	Unvegetated Surface in	bog). The proportion of the AA's contributing area (measured to no more than 1000 m upslope) that is comprised of buildings, roads, parking lots,		[FA, INV, NRv, PRv, SRv, STR, WCv, WSv]
	the Contributing Area	other pavement, exposed bedrock, landslides, and other mostly-bare surface is about : <10%.	1	
		10 to 25%.	0	
		>25%.	0	

OF24 Tr				
	ransport From Upslope	A relatively large proportion of the precipitation that falls farther upslope in the CA reaches this wetland quickly as runoff (surface water), as		[NRv, PRv, SRv, WSv]
		indicated by the following:		
		(a) input channel is present,		
		(b) input channels have been straightened,		
		(c) upslope wetlands have been ditched extensively,		
		(d) land cover is mostly non-forest,		
		(e) CA slopes are steep, and/or (f) most CA soils are shallow (bedrock near surface) and/or have high runoff coefficients.		
		(i) most CA soils are shallow (bedrock hear surface) and/or have high futfor coefficients. This statement is:		
		THIS SELECTION IS.		
		Mostly true.	0	
		Somewhat true.	0	
			0	
		Mostly untrue.		
OF25 As	spect	The overland flow direction of most surface water (in streams, rivers, or runoff) that enters the AA is:		[AM, NR, SFS, WC, WS]
		Northward (N, NE). north-facing contributing area.	0	
		Southward (S, SW), south-facing contributing area.	1	
		, ,	-	
		Other (E, SE, W, NW), or no detectable uphill slope or input channel (flat).		
	nternal Flow Distance	The horizontal flow distance from the wetland's inlet to outlet is:		Identify inlets and outlets, if any, from topographic maps (use elevations to determine which are inlet
(P	Path Length)	<10 m.	0	and which are outlets) and augment by field inspection. [NR, OE, PR, SR, WS]
		10 - 50 m.	0	
		50 - 100 m.	0	
		100 - 1000 m.	1	
		1- 2 km.	0	
		>2 km, or wetland lacks an inlet and outlet.	0

--	----------------	-------------	-----

Form F (Field). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Walk for no less than 10 minutes from the wetland edge towards its core, in the part of the AA that is proposed for alteration. If no alteration is proposed, walk in a portion that appears to be most representative of the wetland overall. Walk only where it is safe and legal to do so. Conduct the assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answer these questions primarily based on your onsite observations and interpretations. Do not write in shaded parts of this data form. Answering some questions accurately may require conferring with the landowner or other knowledgable persons and/or reviewing aerial imagery. For most wetlands, completing this field data form will require 1-2 hours on a site. For a list of functions to which each question pertains, see the accompanying Interpretations form. For detailed descriptions of each WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage & Delay, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity, STR= Stressors.

	tendin 1	Condition of 1		Definition for 1
#	Indicators	Condition Choices	Data	Definitions/Explanations
1	Wetland Type	Follow the key below and mark the ONE row that best describes MOST of the vegetated part of the AA:		Ericaceous shrubs are ones in the heather family (Ericaceae). Most have leathery evergreen leaves. They include rhododendron, azalea, swamp laurel, leatherleaf, Labrador tea, and others. Most require
		A. Moss and/or lichen cover more than 25% of the ground. Often dominated by ericaceous shrubs (e.g., Labrador tea) or other acid-tolerant plants (e.g., bog cranberry, pitcher plant, sundew, orchids). Substrate is mostly undecomposed peat. Choose between A1 and A2 and mark the choice with a 1 in their adjoining column. Otherwise go to 8 below.		acidic soil. Although not in the family Ericaceae, sweetgale (<i>Myrica gale</i>) should be counted also. [AM, CS, FA, FR, INV, NR, OE, PH, Sens, SFS, WBF, WBN]
		A1. Surface water is usually absent or, if present, pH is typically <4.5 and conductivity is usually <100 µSicm (<64 ppm TDS). Trees are absent or nearly so. Sedge cover usually sparse or absent but cottongrass and/or lichen cover may be extensive, as well as cloudberry, lingonberry, sheep laurel, and a sedge (Carex rarillora). Wetland surface and surrounding landscape are seldom sloping and wetland often is domed (convex). Inlet and outlet channels are usually absent. If known, pH of peat is <4.0.	0	
		A2. Not A1. Surface water, if present, has pH typically >4.5 and conductivity is usually >100 µS/cm (>64 ppm TDS). Sedge cover is usually extensive, and/or tree and tall shrub cover is extensive. Sometimes at toe of slope or edge of water body. An exit channel is usually present. Wetter than A1 and peat depth may be shallower (<2 m).	0	
		B. Moss and/or lichen cover less than 25% of the ground. Soil is mineral or decomposed organic (muck). Choose between B1 and B2 and mark the choice with a 1 in their adjoining column:		
		B1. Trees and shrubs taller than 1 m comprise more than 25% of the vegetated cover. Surface water is mostly absent or inundates the vegetation only seasonally (e.g., vernal pools or floodplain).	1	
		B2. Not B1. Tree & tall shrubs comprise less than than 25% of the vegetated cover. Vegetation is mostly herbaceous, e.g., cattail, bulrush, burreed, pond lily, horsetail. Surface water may be extensive and fluctuates seasonally, being either persistent or drying up partly or entirely.	0	
AA shi nclude a dja d descrii	ould also include part of e the open water part ad cent " is used synonymo bed features along their	the AA should include all persistent waters in ponds smaller than 8 hectares (~283 m on a side) that are adjacent to the AA. The the water area of adjacent ponded water larger than 8 ha and adjacent rivers wider than 20 m. Specifically, the AA should jacent to wetland vegetation and equal in width to the average width of that vegetated zone. Throughout this data form, usly with abutting, adjoining, bordering, contiguous and means no upland (manmade or natural) completely separates the directly shared edge. Features joined only by a channel are not necessarily considered to be adjacent a large portion of their res do not have to be hydrologically connected in order to be considered adjacent.		
2	Wetland Types - Adjoining or Subordinate	If the AA is smaller than 1 ha, mark all other types that occupy more than 1% of the vegetated AA. If the AA is larger than 1 ha, mark all other types which are within or adjacent to the AA and occupy more than 1 ha, as visible from the AA or as interpreted from aerial imagery. Do not mark again the type marked in F1.		1 hectare is 10,000 sq. m or about 2.5 acres. It could have dimensions of 100 m by 100 m, 1000 m by 10 m, or similar. [AM, INV, SBM, WBF]
		A1. A2.	0	
		B1.	0	
		B2.	0	
3	Woody Height & Form Diversity	Following EACH row below, indicate with a number code the percentage of the living vegetation in the AA which is occupied by that feature (6 if >95%, 5 if 75-95%, 4 if 50-75%, 3 if 25-50%, 2 if 5-25%, 1 if <5%, 0 if none). If the vegetated part of the AA is largely herbaceous (non-woody) vegetation, these percentages should not sum to 100%.		Deciduous shrubs in this region usually include buttonbush, Labrador tea, bayberry (Morella), huckleberry, cranberry, cloudberry, sweetgale, alder, willow, birch, ash, dogwood, and a few others. If you assigned a code of 3 or higher to any of the first four choices and the ground cover beneath the trees/shrubs is <25% moss, then question F1 might be "B1". [CS, NV, NR, PH, POL, SBM, Sens]
		coniferous trees (may include tamarack) taller than 3 m. deciduous trees taller than 3 m.	5	• • • • • • • • • • • • • • • • • • • •
		coniferous or ericaceous shrubs or trees 1-3 m tall not directly below the canopy of trees.	2	
		deciduous shrubs or trees 1-3 m tall not directly below the canopy of trees. coniferous or ericaceous shrubs <1 m tall not directly below the canopy of taller vegetation.	2	
		deciduous shrubs or trees <1 m tall (e.g., deciduous seedlings) not directly below the canopy of taller vegetation.	2	
lote :	If none of top 4 rows in	F3 was marked 2 or greater , SKIP to F9 (N fixers).		
4	Dominance of Most	Determine which two woody plant species comprise the greatest portion of the low (<3 m) woody cover . Then choose one:		[PH, POL, SBM, Sens]
	Abundant Shrub Species	those species together comprise > 50% of such cover.	1	
5	Woody Diameter	those species together do not comprise > 50% of such cover. Mark ALL the types that comprise >5% of the woody canopy cover in the AA or >5% of the wooded areas (if any) along its upland edge	0	Estimate the diameters at chest height. 		30 - 49 m. 50 - 100 m.	0	-
		50 - 100 m. > 100 m, or open water is absent at that time.	0	1
F35	Flat Shoreline Extent	During most of the part of the growing season when water is present, the percentage of the AA's water edge length that is nearly flat (a slope less than about 5% measured within 5 m landward of the water) is:		If several isolated pools are present in early summer, estimate the percent of their collective shorelines that has such a gentle slope. [SR, WBN]
		<1% of the water edge.	0	-
		1-25% of the water edge. 25-50% of the water edge.	0	1
		50-75% of the water edge.	0	1
Ec.		>75% of the water edge.	0	
F36	Robust Emergents	The percentage of the emergent vegetation cover in the AA that is cattail (<i>Typha</i> spp.), common reed (<i>Phragmites</i>), or tall (>1m) bulrush is:		Emergent vegetation is herbaceous plants whose stems are partly above and partly below the water surface during most of the time water is present. [WBN]
		<1% of the emergent vegetation, or emergent vegetation is absent. SKIP to F38.	0	
		1-25% of the emergent vegetation.	0	
		25-75% of the emergent vegetation. >75%, of the emergent vegetation.	0	1
			_	

FieldF form - Non-tidal Page 3 of 5

F37	Interspersion of	During most of the part of the growing season when water is present, the spatial pattern of emergent vegetation within the water is mostly:		[AM, FA, FR, INV, NR, OE, PH, PR, SBM, SR, WBF, WBN]
	Emergents & Open			
	Water	Scattered. More than 30% of such vegetation forms small islands or corridors surrounded by water. Intermediate.	0	
		Clumped. More than 70% of such vegetation is in bands along the wetland perimeter or is clumped at one or a few sides of the surface water	0	
F38	Persistent Deepwater	area. If the deepest patch of surface water (flowing or ponded) in or directly adjacent to the AA is mostly deeper than 0.5 m for >2 weeks during the	0	
	Area	growing season, enter *1* and continue. If not, enter *0* and SKIP to F42.(Connection).		
F39	Non-vegetated Aquatic Cover	During most of the growing season and in waters deeper than 0.5 m, the cover for fish, aquatic invertebrates, and/or amphibians that is provided NOT by living vegetation, but by accumulations of dead wood and undercut banks is:		For this question, consider only the wood that is at or above the water surface. Estimates of underwater wood based only on observations from terrestrial viewpoints are unreliable so should not be attempted.
		Little or none.	0	[AM, FA, FR, INV]
		Intermediate. Extensive.	0	
F40	Isolated Island	The AA contains (or is part of) an island or beaver lodge within a lake, pond, or river, and is isolated from the shore by water depths >1 m on	0	[WBN]
		all sides during an average June. The island may be solid, or it may be a floating vegetation mat that is sufficiently large and dense to support a waterbird nest.		
F41	Floating Algae & Duckweed	At some time of the year, mats of algae and/or duckweed are likely to cover >50% of the AA's otherwise-unshaded water surface, or blanket >50% of the underwater substrate. If true, enter "1" in next column. If untrue or uncertain, enter "0".	0	[EC, PR, WBF]
F42	Channel Connection & Outflow Duration	The most persistent surface water connection (outlet channel or pipe, ditch, or overbank water exchange) between the AA and a downslope stream network is: [Note: If the AA represents only part of a wetland, answer this according to whichever is the least permanent surface connection: the one between the AA and the rest of the wetland, or the surface connection between the wetland and the downslope stream network.] Persistent (surface water flows out for >9 months/year).	0	Consider the connection regardless of whether the surface water is frozen. The "downslope stream network" could consist of ditches, rivers, ponds, or lakes which eventually connect to the ocean. If this cannot be determined white visiting the AA, consult topographic maps perhaps by viewing these online with Toporama (http://atlas.nrcan.gc.ca/hoporama/en/index.html) [CS, FA, FR, NR, OE, PR, Sens, SFS SR, Wcv, WS]
		Seasonal (surface water flows out for 14 days to 9 months/year, not necessarily consecutive).	0	
		Temporary (surface water flows out for <14 days, not necessarily consecutive). None but maps show a stream network downslope from the AA and within a distance that is less than the AA's length. SKIP to F47 (pH	0	
		Measurement).		
		No surface water flows out of the wetland except possibly during extreme events (<once (ph="" 10="" a="" an="" ditch,="" f47="" flows="" into="" lacks="" lake="" measurement).<="" only="" or="" or,="" outlet.="" per="" skip="" td="" that="" to="" water="" wetland,="" years).=""><td>0</td><td></td></once>	0	
F43	Outflow Confinement	During major runoff events, in the places where surface water exits the AA or connected waters nearby, the water:		"Major runoff events" would include biennial high water caused by storms and/or rapid snowmell. [CS, NR, OE, PR, Sens, SR, STR, WS]
		Mostly passes through a pipe, culvert, narrowly breached dike, berm, beaver dam, or other partial obstruction (other than natural topography) that does not appear to drain the wetland artificially during most of the growing season.	0	and only only only maj
		Leaves through natural exits (channels or diffuse outflow), not mainly through artificial or temporary features.	0	
		is exported more quickly than usual due to ditches or pipes within the AA or connected to its outlet, or within 10 m of the AA's edge, which drain the wetland artificially, or water is pumped out of the AA.	0	
F44	Tributary Channel	At least once annually, surface water from a tributary channel that is >100 m long moves into the AA. Or, surface water from a larger permanent water body adjacent to the As pills into the AA. If it enters only via a pipe, that pipe must be fed by a mapped stream or lake further usologe. If no, SKIP to F47 (pH Measurement).	0	If inlet tributaries cannot be searched for due to inaccessibility of part of the AA, follow suggestions in F42 above, [NRv, PH, PRv, SRv]
F45	Input Water	Based on lack of shade, water source characteristics, or actual temperature measurements, the inflow is likely to be warmer than surface	0	[WCv]
	Temperature	water in the AA during part of most years. Enter 1= yes, 0= no.		
F46	Throughflow	During its travel through the AA at the time of peak annual flow, water arriving in channels: [select only the ONE encountered by most of the		[FA, FR, INV, NR, OE, PR, SR, WS]
	Resistance	incoming water]. Does not bump into many plant stems as it travels through the AA. Nearly all the water continues to travel in unvegetated (often incised)	0	
		channels that have minimal contact with wetland vegetation, or through a zone of open water such as an instream pond or lake.		
		Bumps into herbaceous vegetation but mostly remains in fairly straight channels.	0	
		Bumps into herbaceous vegetation and mostly spreads throughout, or is in widely meandering, multi-branched, or braided channels.	0	
		Bumps into tree trunks and/or shrub stems but mostly remains in fairly straight channels.	0	
		Bumps into tree trunks and/or shrub stems and follows a fairly indirect path from entrance to exit (meandering, multi-branched, or braided).	0	
F47	pH Measurement	The pH in most of the AA's surface water:		Preferably, measure this in larger areas of ponded surface water within the AA, or in streams that have
		Was measured, and is: [enter the reading in the column to the right.]		passed through (not along) most of the AA. Unless surface water is completely absent, do not dig holes or make depressions in peat in order to provide water for this measurement. Avoid measuring near
		Was not measured but surface water is present and is darkly tea-coloured. Or if no surface water, then mosses and plants that indicate peatland (e.g., Labrador tea) are prevalent. Enter "1".	0	roads or in puddles formed only by recent rain. [AM, FA, FR, NR, WBF, PH, PR, Sens, WBF, WBN]
		Neither of above. Enter "1".	1	
F48	TDS and/or Conductivity	The TDS (total dissolved solids) or conductivity off the AA's surface water is: (select the first true row with information):		See above for measurement guidance. [FR, INV, NRv, PH, PRv, Sens]
	Conductivity	TDS is: [Enter the reading in ppm or mg/L in the column to the right, if measured, or answer next row.] Conductivity is [Enter the reading in µSicm in the column to the right.]		
		Was not measured, but plants that indicate saline conditions cover much of the vegetated AA. Enter "1".	0	
F49	Beaver Probability	Neither of above Use of the AA by beaver during the past 5 years is (select most applicable ONE):	1	[FA, FR, PH, SBM, Sens, WBF, WBN]
	Board Frobability	Evident from direct observation or presence of gnawed limbs, dams, tracks, dens, lodges, or extensive stands of water-killed trees (snags).	0	
		Likely based on known occurrence in the region and proximity to suitable habitat, which may include: (a) a persistent freshwater wetland,	0	
		pond, or lake, or a perennial low or mid-gradient (<10%) channel, and (b) a corridor or multiple stands of hardwood trees and shrubs in	U	
		vegetated areas near surface water. Unlikely because site characteristics above are deficient, and/or this is a settled area or other area where beaver are routinely removed.	1	
F50	Groundwater Strength	Select first applicable choice:		Adhere to these criteria strictly do not use personal judgment based on fen conditions, pH, or other
	of Evidence	Springs are known to be present within the AA, or if groundwater levels have been monitored, that has demonstrated that groundwater primarily discharges to the wetland for longer periods during the year than periods when the wetland recharges the groundwater.	0	evidence. Consult lopographic maps to detect breaks in slope described here. Rust deposits associated with groundwater seeps may be most noticeable as orange discoloration in ice formations along streams during early winter. [AM, CS, FA, FR, INV, NR, OE, PH, PRv, SFS, WC, WS]
		Most of the AA has a slope of >5%, or is very close to the base of a natural slope longer than 100 and much steeper than the slope of the AA, AND the pH of surface water, if known, is >5.5.	0	
F51	Internal Gradient	Neither of above is true, although some groundwater may discharge to or flow through the AA. Or groundwater influx is unknown. The gradient along most of the flow path within the AA is:	1	This is not the same as the shoreline slope. It is the elevational difference between the AA's inlet and
. 01	incinai Grauletti	The gradient along most of the now pain within the AA is: Consider the AA has no surface water outlet (not even seasonally). Consider the AA has no surface water outlet (not even seasonally).	0	outlet, divided by the flow-distance between them and converted to percent. If available, use a
		2-5%.	1	clinometer to measure this. Free clinometer apps can be downloaded to smartphones. If the wetland is large (longer than -1 km), this may be estimated using Google Earth to determine the minimum and
		6-10%. >10%.	0	maximum elevation within the AA, then dividing by length and multiplying by 100. [CS, NR, OE, PR, SR, WBF, WBN, WS]
		ions: If the AA lacks an upland edge, evaluate based on the AA's entire perimeter, and moving outward into whatever areas are		
		hese questions are best answered by measuring from aerial images.		TAM EA ED INN ND, DU DOL DOL COM CORE CO. CTD MIDMI
F52	Vegetated Buffer as % of Perimeter	Within a zone extending 30 m laterally from the AA's edge with upland and/or other wetlands, the percentage that contains perennial vegetation cover (except lawns, row crops, heavily grazed land, conifer plantations) is:		[AM, FA, FR, INV, NRv, PH, POL, PRv, SBM, Sens, SRv, STR, WBN]
		<5%.	0	
		5 to 30%. 30 to 60%.	0	
		60 to 90%.	0	
		>90%, or all the area within 30 m of the AA edge is other wetlands. SKIP to F55.	_	

FieldF form - Non-tidal Page 4 of 5

53	Type of Cover in Buffer	Within 30 m upslope of where the wetland transitions to upland, the upland land cover that is NOT perennial vegetation is mostly (mark ONE):		[AM, FA, INV, NRv, PH, POL, SBM, STR, WBN]
	Type of cover in Buner	, , , , , , , , , , , , , , , , , , , ,		
		Impervious surface, e.g., paved road, parking lot, building, exposed rock.	0	
	D # 01	Bare or nearly bare pervious surface or managed vegetation, e.g., lawn, row crops, unpaved road, dike, landslide.	0	(ND DD C CD)
54	Buffer Slope	The steepest and/or most disturbed part of the upland area that is within 30 m of the wetland and occupies >10% of that upland area has a percent slope of:		[NRv, PRv, Sens, SRv]
		<1% (flat almost no noticeable slope) or all the area within 30 m of the AA edge is other wetlands.	0	
		2-5%.	0	1
		5-30%.	0	
		>30%.	0	
55	Cliffs or Steep Banks	In the AA or within 100 m, there are elevated terrestrial features such as cliffs, falus slopes, stream banks, or excavated pits (but not riprap) that extend a least 2 m nearly vertically, are unvegetated, and potentially contain crevices or other substrate suitable for nesting or den areas. Enter 1 (yes) or 0 (no).	0	Do not include upturned trees as potential den sites. [POL, SBM]
56	New or Expanded Wetland	Human actions within or adjacent to the AA have persistently expanded a naturally occurring wetland or created a wetland where there previously was none (e.g., by excavation, impoundment):		Determine this using historical aerial photography, old maps, soil maps, or permit files as available [CS NR, OE, PH, Sens]
		No.	1	
		Yes, and created or expanded 20 - 100 years ago. Yes, and created or expanded 3-20 years ago.	0	4
		Yes, and created or expanded within last 3 years.	0	1
		Yes, but time of origin or expansion unknown.	0	1
		Unknown if new or expanded within 20 years or not.	0	1
57	Burn History	More than 1% of the AA's previously vegetated area:		Look for charred soil or stumps (in multiple widely-spaced locations) or ask landowner. [CS, PH, STR]
		Burned within past 5 years.	0	
		Burned 6-10 years ago.	0	1
		Burned 11-30 years ago.	0	1
		Burned >30 years ago, or no evidence of a burn and no data.	1	
58	Visibility	The maximum percentage of the wetland that is visible from the best vantage point on public roads, public parking lots, public buildings, or		[PU, STR, WBFv]
		public maintained trails that intersect, adjoin, or are within 100 m of the AA (select one) is:		
		<25%.	1	
		25·50%. >50%.	0	4
59	Non-consumptive	Assuming access permission was granted, select ALL statements that are true of the AA as it currently exists:	U	[PU, STR]
0,	Uses - Actual or			[0, 0.11 ₄
	Potential	For an average person, walking is physically possible <u>in</u> (not just near) >5% of the AA during most of the growing season, e.g., free of deep water and dense shrub thickels. Maintained roads, parking areas, or foot-trails are within 10 m of the AA, or the AA can be accessed part of the year by boats arriving via	0	
		configuous waters. Within or near the AA, there is an interpretive center, trails with interpretive signs or brochures, and/or requiar quided interpretive tours.	0	-
60	Unvisited Core Area	The percentage of the AA almost never visited by humans during an average growing season probably comprises: [Note: Only include the		[AM, FAv, FRv, PH, PU, SBM, STR, WBF, WBN]
		part actually walked or driven (not simply viewed from) with a vehicle or boat. Do not include visitors on traits outside of the AA unless more than half the wetland is visible from the traits and they are within 30 m of the wetland edge. In that case include only the area occupied by the trait.)		
		<5% and no inhabited building is within 100 m of the AA.	0	
		<5% and inhabited building is within 100 m of the AA.	0	1
		5-50% and no inhabited building is within 100 m of the AA.	0	
		5-50% and inhabited building is within 100 m of the AA.	0	
		50-95%, with or without inhabited building nearby.	0	
7/1	F	>95% of the AA with or without inhabited building nearby.	1	IAM DIL DIL COM CTD WDF WDNI
61	Frequently Visited Area	The part of the AA visited by humans almost daily for several weeks during an average growing season probably comprises: [See note above.]		[AM, PH, PU, SBM, STR, WBF, WBN]
	riica	<5%. If F60 was answered ">95%" (mostly never visited), SKIP to F64.	1	
		5-50%.	0	
		50-95%.	0	1
		>95% of the AA.	0	
62	BMP - Soils	Boardwalks, paved trails, fences or other infrastructure and/or well-enforced regulations appear to effectively prevent visitors from walking on soil within nearly all of the AA when the soil is unfrozen. Enter "1" if true.	0	[PH, PU]
63	BMP - Wildlife Protection	Fences, observation blinds, platforms, paved trails, exclusion periods, and/or well-enforced prohibitions on motorised boats, off-leash pets, and off road vehicles appear to effectively exclude or divert visitors and their pets from the AA at critical times in order to minimize disturbance of wildlife (except during hunting seasons). Enter *1* if true.	0	[AM, PU, WBF, WBN]
64	Consumptive Uses	Recent evidence was found within the AA of the following potentially-sustainable consumptive uses. Select ALL that apply.		[FAv, FRv, WBFv]
	(Provisioning Services)	Low-impact commercial timber harvest (e.g., selective thinning).	0	1
		Commercial or traditional-use harvesting of native plants, their fruits, or mushrooms.	0]
		Waterfowl hunting.	0]
		Fishing.	0	1
		Trapping of furbearers.	0	
65	Domestic Wells	None of the above. The closest wells or water bodies that currently provide drinking water are:	1	[NRv]
UU	Domestic Wells			pusy
		Within 0-100 m. of the AA.	0	4
		100-500 m. away. >500 m. away, or no information.	0	
			1	(ALL DR)
66	Calcareous Fen	The AA is, or is part of, a calcareous fen. See the Plants. Calcar worksheet in the accompanying Supplnfo file for list of plant indicators	0	[PH, PR]

FieldS form Non-tidal 2

Assessment Area (AA) Results:

Wetland ID: BOR WL 15

Date: 11 October 2019 Observer: Derrick Mitchell

Latitude & Longitude (decimal degrees):

Scores will appear below after data are entered in worksheets OF, F, and S. See Manual for definitions and descriptions of how scores were computed.

Wetland Functions or Other Attributes:	Function Score (Normalised)	Function Rating	Benefits Score (Normalised)	Benefits Rating	Function Score (raw)	Benefits Score (raw)
Water Storage & Delay (WS)	9.04	Higher	1.30	Lower	8.68	1.38
Stream Flow Support (SFS)	1.04	Lower	0.00	Lower	0.56	0.00
Water Cooling (WC)	0.00	Lower	0.00	Lower	0.00	0.00
Sediment Retention & Stabilisation (SR)	5.13	Moderate	0.37	Lower	6.67	0.22
Phosphorus Retention (PR)	5.32	Higher	0.00	Lower	6.68	0.33
Nitrate Removal & Retention (NR)	10.00	Higher	1.00	Lower	10.00	2.00
Carbon Sequestration (CS)	6.98	Higher			7.57	
Organic Nutrient Export (OE)	6.11	Higher			5.57	
Anadromous Fish Habitat (FA)	0.00	Lower	0.00	Lower	0.00	0.00
Resident Fish Habitat (FR)	0.00	Lower	0.00	Lower	0.00	0.00
Aquatic Invertebrate Habitat (INV)	8.29	Higher	0.99	Moderate	6.79	1.78
Amphibian & Turtle Habitat (AM)	3.09	Lower	1.08	Lower	4.93	2.75
Waterbird Feeding Habitat (WBF)	0.00	Lower	0.00	Lower	0.00	0.00
Waterbird Nesting Habitat (WBN)	0.00	Lower	0.00	Lower	0.00	0.00
Songbird, Raptor, & Mammal Habitat (SBM)	6.93	Moderate	2.50	Lower	5.75	2.50
Pollinator Habitat (POL)	9.96	Higher	0.00	Lower	8.02	0.00
Native Plant Habitat (PH)	6.16	Higher	5.29	Moderate	5.57	4.59
Public Use & Recognition (PU)			2.26	Lower		1.94
Wetland Sensitivity (Sens)			1.94	Lower		2.78
Wetland Ecological Condition (EC)			8.55	Higher		9.17
Wetland Stressors (STR) (higher score means more stress)			0.22	Lower		2.34
Summary Ratings for Grouped Functions:						
HYDROLOGIC Group (WS)	1.04	Lower	1.30	Lower	8.68	1.38
WATER QUALITY SUPPORT Group (max+avg/2 of SR, PR, NR, CS)	8.41	Higher	0.73	Lower	8.86	1.43
AQUATIC SUPPORT Group (max+avg/2 of SFS, INV, OE, WC)	6.08	Higher	0.66	Lower	5.01	1.19
AQUATIC HABITAT Group (max+avg/2 of FA, FR, AM, WBF, WBN)	1.85	Lower	0.65	Lower	2.96	1.65
TRANSITION HABITAT Group (max+avg/2 of SBM, PH, POL)	8.82	Higher	3.94	Moderate	7.23	3.48
WETLAND CONDITION (EC)			8.55	Higher		9.17
WETLAND RISK (average of Sensitivity & Stressors)			1.08	Lower		2.56
	NOTE A				a abaant from t	

NOTE: A score of 0 does not mean the function or benefit is absent from the wetland. It means only that this wetland has a capacity that is equal or less than the lowest-scoring one, for that function or benefit, from among the 98 NB calibration wetlands that were assessed previously.

Cover Page: Basic Description of Assessment	WESP-AC version 2
Site Name	Burchill Wind Energy Project - MCB-W-01
Investigator Name	Matt Alexander
Date of Field Assessment	9 October 2019
Nearest Town	Lorneville (west Saint John), New Brunswick
Latitude (decimal degrees)	45.162984
Longitude (decimal degrees)	66.195641
ls a map based on a formal on-site wetland delineation available	Yes
Approximate size of the Assessment Area (AA, in hectares)	3.90
AA as percent of entire wetland (approx.). Attach sketch map if AA is smaller than the entire contiguous wetland	
What percent (approx.) of the wetland were you able to visit?	100
What percent (approx.) of the AA were you able to visit?	100
Were you able to ask the site owner/manager about any of the questions?	No
Indicate here if you intentionally surveyed for rare plants, calciphile plants, or rare animals	Yes
Have you attended a WESP-AC training session? If so, indicate approximate month & year	Yes, September 2016
How many wetlands have you assessed previously using WESP-AC? (approx.	15
Comments about the site or this WESP-AC assessment (attach extra page if desired)	

Form OF (Office). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Conduct an assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answering many of the questions below will equire using these online map viewers:

Google Earth Pro: https://www.google.com/earth/download/gep/agree.html

GeoNB: http://www.snb.ca/geonb1/ and http://www.snb.ca/geonb1/e/apps/apps-E.asp

Geons: http://www.snb.ca/geonol/ and http://www.snb.ca/geonol/e/apps/apps/apps-e.asp
For most wetlands, completing this office data form will require 1-2 hours. For a list of functions to which each question pertains, see bracketed abbreviations in the Definitions/Explanations column. For detailed descriptions of each
WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus
Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding
Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity, STR= Stressors.

#	Indicators	Condition Choices	Data	Definitions/Explanations
OF1	Province	Mark the province in which the AA is located by changing the 0 in the column next to it to a "1". Mark only one.		This determines to which province's calibration wetlands the raw score of any wetland is normalised. In the function and benefits models, it also triggers the automatic exclusion of indicators for which no
		New Brunswick	1	spatial data exists in a particular province.
		Nova Scotia	0	
		Prince Edward Island	0	
		Newfoundland-Labrador (Carlotte Labrador Carlotte Labrador Carlott	0	
DF2	Ponded Area Within 1 km.	The area of surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) within 1 km is:		"Adjacent" means not separated from the AA by a wide expanse (>50 m) of upland (including roads >50 m wide). Include ponded areas likely to be hidden by wetland vegetation. If surface water
		<0.01 hectare (about 10 m x 10 m).	0	extends beyond 1 km, include only the part within 1 km. Do not include tidal areas. Measure the ar- from aerial imagery using Google Earth Pro (click on Ruler icon in toolbar, then Polygon in pop-up
		0.01 - 0.1 hectare.	0	menu). With the GeoNB viewer, enable the Wetlands layer, then measure with the Draw & Measure
		0.1 - 1 hectare.	- 1	tool after specifying Aerial as the Basemap. However, do not rely entirely on wetland boundaries
		1 to 10 hectares.	0	shown in online wetlands layers. [PH, SBM, WBN]
		10 to 100 hectares.	0	
DF3	Ponded Water &	>100 hectares. The area of wetlands and surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) withi		See definition of adjacent in OF2. If the AA's wetland vegetation extends beyond 1 km, include only
JI 3	Wetland Within 1 km.	1 km is:		the part within 1 km. "Ponded" means not flowing in rivers or streams. [Sens, WBF]
		<0.01 hectare (about 10 m x 10 m).	0	
		0.01 - 0.1 hectare.	0	
		0.1 - 1 hectare. 1 to 10 hectares.	1	
		10 to 100 hectares.	0	
		10 to no nectares. >100 hectares.	0	1
DF4	Size of Largest Nearby	The largest vegetated patch or corridor that includes the AA's vegetation plus aladjacent upland vegetation that is not lawn, row crops,	ı .	See definition of adjacent in OF2. Use Google Earth Pro's polygon ruler (as described above).
	Vegetated Tract or Corridor	heavily grazed lands, conifer plantation is:		Exclude conifer plantations only if it is obvious that trees were planted in rows. [AM, PH, SBM, Sens]
	Comuci	<0.01 hectare (about 10 m x 10 m).	0	
		0.01 - 0.1 hectare.	0	
		0.1 - 1 hectare.	0	
		1 to 10 hectares. 10 to 100 hectares.	0	
		10 to 100 hectares. 100 to 1000 hectares.	0	-
		>1000 hectares. [This is nearly always the answer in relatively undeveloped landscapes]	1	
DF5	Distance to Large	The minimum distance from the edge of the AA to the edge of the closest vegetated land (but excluding row crops, lawn, conifer		To measure distance, use Google Earth Pro (Ruler > Line tool). Or use Draw & Measure tool at GeoNB. The 375-ha criterion is from the Fundy Model Forest Project. [AM, PH, POL, SBM, Sens]
	Vegetated Tract	plantation) larger than 375 hectares (about 2 km on a side), is: <50 m, and not separated from the 375-ha vegetated area by any width ofpaved roads, stretches of open water, row crops, bare ground,	1	GeonB. The 375-fla criterion is from the Fundy Model Forest Project. [AM, PH, POL, SBM, Sens]
		awn, or impervious surface. Or the AA itself contains >375 ha of vegetation. [This is often the answer in relatively undeveloped landscape <50 m, but completely separated from the 375-ha vegetated area by those features, and AA does not contain >375 ha of vegetation.	0	
		50-500 m, and not separated.	0	4
		50-500 m, but separated by those features.	0	
		0.5 - 5 km, and no t separated. 0.5 - 5 km, but separated by those features.	0	
		None of the above (the closest patches or corridors which are that large are >5 km away).	0	1
OF6	Herbaceous Uniqueness	The AA's vegetation cover is >10% herbaceous" but uplands within 5 km have <10% herbaceous cover. If so, enter "3" and continue to	0	For this question only, consider moss to be herbaceous vegetation. Determine the score by viewing
		OF7. If not, consider: The AA's vegetation cover is >10% herbaceous* but uplands within 1 km have <10% herbaceous cover. If so enter "2" and continue to OF7. If not, consider: The AA's vegetation cover is >10% herbaceous* but uplands within 100 m of the wetland edge have <10% herbaceous cover. If so, enter "1". "INOTE: Exclude lawns, row crops, heavily grazed lands, forest, shrublands. Include moss as well as grasslike plants in this use of herbaceous vegetation".	-	aerial imagery in Google Earth after successively drawing or estimating the boundaries of the buffer of 5 km, 1 km, and 100 m radius focused on the center of the AA. Circles of specified radius can be drawn in Google Earth Pro by clicking on the Ruler icon, then Circle in the pop-up menu. [AMv, PHv POLv, SBMv, WBFv, WBNv]
OF7	Woody Uniqueness	The AAT's vegetation cover is >10% woody" but uplands within 5 km have <10% woody cover. If so, enter "3" and continue to OF8. If not, consider:	0	See above. Do not consider conifer plantations to be forest if it is obvious that trees were planted in fows. [AMv, PHv, POLv, SBMv]
		The A/S vegetation is >10% woody" but uplands within 1 km have <10% woody cover. If so enter "2" and conlinue to OF8. If not, consider: The A/S vegetation is >10% woody" but uplands within 100 m of the wetland edge have <10% woody cover. If so, enter "1"		Toron, Party, 1 10, 1 Oct., Sching
		[* NOTE: woody cover = trees & shrubs taller than 1 m.]		
OF8	Local Vegetated Cover Percentage	Draw a 5-km radius circle measured from the center of the AA. Ignoring all permanent water in the circle, the percent of the remaining are that is wooded or unmanaged herbaceous vegetation (NOT lawn, row crops, bare or heavily grazed land, clearcuts, or conifer plantations, is:		In Google Earth, draw the 5 km buffer and then estimate land cover percentages, or do GIS analysis of an appropriate land cover layer. [AM, PH, POL, SBM, Sens]
		<5% of the land.	0	4
		5 to 20% of the land.	0	4
		20 to 60% of the land.	0	4
		60 to 90% of the land.	0	
DF9	Type of Land Cover	>90% of the land. SKIP to OF10. Militing the Expression and imported all normanon water, the land area that is bare or non percental cover is mostly.		[AM, SBM]
JI 7	Alteration	Within the 5-km radius circle, and ignoring all permanent water, the land area that is bare or non-perennial cover is mostly:		(run, John)
		Impervious surface, e.g., paved road, parking lot, building, exposed rock.	0	1
		Bare pervious surface, e.g., lawn, recent (<5 yrs ago) clearcut, dirt or gravel road, cropland, landslide, conifer plantation.	0	
	Distance by Road to Nearest Population	Measured along the maintained road nearest the AA, the distance to the neares population center is:		"Population center" means a settled area with more than about 5 regularly- inhabited structures per
OF10		<100 m.	0	square kilometer. In Google Earth, click on the Ruler icon, then Path, and draw and measure the route. Or use the GeoNB's Draw & Measure tool> Freehand Line to draw and measure the route to
OF10			Toute. Of use the Ger	route. Or use the GeoNB's Draw & Measure tool> Freehand Line to draw and measure the route
OF10	Center	100 - 500 m.	0	Settlements (click on Place Names in menu) or other areas not close to mapped settlements but
OF10		100 - 500 m. 0.5- 1 km.	0	
OF10				Settlements (click on Place Names in menu) or other areas not close to mapped settlements but

OF11	Distance to Nearest	From the center of the AA, the distance to the nearest maintained public road (dirt or paved) is:		Determine this by viewing aerial imagery in Google Earth and measuring with the Ruler>Line tool.
	Maintained Road	<10 m.	0	use the GeoNB's Draw Line tool. [AM, FAv, FRv, NRv, PH, PU, SBM, STR, WBN]
		10 - 25 m.	0	
		25 - 50 m.	0	
		50 - 100 m. 100 - 500 m.	0	
		>500 m.	0	
OF12	Wildlife Access	Draw a circle of radius of 5 km from the center of the AA. If mammals and amphibians can move from the center of the AA to ALL other separate wetlands and ponds located within the circle without being forced to cross pavement (any width), lawns, bare ground, and/or marine waters, mark 1 = yes can move to all, 0 = no. Change toblank if there are no other wetlands within 5 km.	0	In NB, enable the Wellands layer in GeoNB (despite its omissions) to show surrounding wetlands a roads, while estimating the location of the 5 km circle (or draw the 5 km circle in Google Earth Pro using the Circle tool and compare). Evaluate using Google Earth, being cautious to search for roads whether under George LAND. STID STID.
OE12	Distance to Ponded	The distance from the AA center to the closest (but separate) ponded water body visible in GoogleEarth imagery is:		hidden under forest canopy. [AM, SBM, STR] In Google Earth, zoom in closely to examine the surrounding landscape for ponds, lakes, and
01 13	Water	The distance from the AV center to the closest points pointed water body visible an escoglectual minglery is. 450 m, and not separated by any width of paved roads, stretches of open water, row crops, lawn, bare ground, or impervious surface.	0	wellands that appear to be permanently flooded. Enable the GeoNB viewer's Wellands layer as we [AM, PH, SBM, Sens, WBF, WBN]
		<50 m, but completely separated by those features.	0	
		50-500 m, and not separated.	0	
		50-500 m, but separated by those features. 0.5 - 1 km. and not separated.	0	
		0.5 - 1 km, but separated by those features.	1	
		None of the above (the closest patches or corridors that large are >1 km away).	0	
OF14	Distance to Large Ponded Water	The distance from the AA center to the closest (but separate)non-lidal body of water that is ponded during most of the year and islarger than 8 hectares during most of a normal year is:		Determine this by viewing aerial imagery in Google Earth. [Sens, WBF, WBN]
		<100 m.	0	
		100 m - 1 km. 1 - 2 km.	0	-
		2-5 km.	1	
		5-10 km.	0]
		>10 km.	0	
OF15	Tidal Proximity	The distance from the AA edge to the closesttidal water body (regardless of its salinity) is:		in Google Earth, measure the distance to the ocean (including Bay of Fundy) or tidal river, whicheve is closer. If you need to see how far upriver a river is tidal, see the KMZ file provided with this
		<100 m.	0	closer. If you need to see now far upriver a river is tidal, see the kinz life provided with this calculator for NB (NB Headtide). Points shown in those files are only an approximation, so local
		100 m - 1 km.	1	information if available may be preferable. [FA, WBF]
		1 - 5 km. 5-10 km.	0	
		10-40 km.	0	1
		>40 km.	0	1
OF16	Upland Edge Contact	Select one:		[NR, SBM, Sens]
		The AA has no upland edge (or upland is <1% of perimeter). The AA is entirely surrounded by (& contiguous with) other wetlands or water	. 0	
		1-25% of the AA's perimeter abuts upland (including filled areas). The rest adjoins other wellands or water that is mostly wider than the A/		
		25-50% of the AA's perimeter abuts upland. The rest adjoins other wetlands or water that is mostly wider than the AA. 50-75% of the AA's perimeter abuts upland. The rest adjoins other wetlands or water that is mostly wider than the AA.	0	-
		More than 75% of the AA's perimeter abuts upland. Any remainder adjoins other wetlands or water that is mostly wider than the AA.This	1	
		will be true for most assessments done with WESP-AC.		
OF17		Within 5 km downstream or downslope of the AA (select first true choice):		In the GeoNB map viewer: click on "More" in upper right, then "Flood Information". Expand the mer under it by clicking on the arrow to its left and the slider to its right. Uncheck the first (Limits of Data
	tidal Waters	Maps show Flood Zone or Flood Risk areas and there appears to be infrastructure vulnerable to river flooding not caused by tidal storm surges.	0	under in by clicking on the arrow to its left and the slider to its right. Uncheck the first (Limits of Data box. Where available, LIDAR imagery can provide finer elevational resolution useful for flood modeling. [WSv]
		Maps show Flood Zone or Flood Risk areas, but infrastructure is absent or is not vulnerable to floods from a non-tidal river. In some cases leaves, upriver dams, or other measures may partly limit damage or risk from smaller events. Maps do not show Flood Zone or Flood Risk areas; br no such mapping has been done locally) and there appears to be infrastructure	0	
		vulnerable to river flooding unrelated to tidal storm surges.		
OF18	Relative Elevation in	Maps do not show Flood Zone or Flood Risk areas (or no such mapping has been done locally) and there i no infrastructure vulnerable to river flooding unrelated to lidal storm surges. In Google Earth, enable the Terrain layer (lower left menu) and open the NB_Watersheds KMZ file that accompanies this calculator. Then	1	[FA, NR, Sens, SFSv, WCv, WSv]
	Watershed	determine the AA's approximate elevation (bottom right, NOT the "eye alt"). Then move cursor around to determine the watershed's maximum and minimum elevation. Divide the AA's elevation by the (max-min).	0.29	
	Water Quality Sensitive Watershed or Area	In Google Earth, open the KMZ file NB_Watershed Protected Area which accompanies this calculator. The AA is within such an area. Enter 1 = yes, 0 = no.	0	If an ACCDC report is available for this AA, it also may contain such information. [NRv]
OF20	Degraded Water Upstream	Sampling indicates a problem with concentrations ofmetals, hydrocarbons, nutrients, or other substances (excluding bacteria, acidic water, high temperatures) being present at levels harmful to aquatic life or humans, and:		May use existing data, or sample those waters as part of this wetland assessment. "Harmful" shoul be evaluated with regard to current federal or provincial water quality standards. [AM, FA, FR, NRv, PRv, SRv, STR, WBF, WBN]
		The condition is present within the AA. The condition is present in waters within 1 km that flowinto the AA, but has not been documented in the AA itself.	0	, M, SM, SM, HBI , HBIIJ
		The condition is present in waters within 1 km that flowinto the AA, but has not been documented in the AA itself. Sampling during both low water periods and times with high runoff (storms, snowmelt) indicates no problems in either the AA or inflowing.	0	1
		waters.	Ľ	
		Data are insufficient (no or inadequate sampling within 1 km, or condition exists only at >1 km upstream)This is the situation for nearly all wetlands in this region.	1	
OF21	Degraded Water	The problem described above is downslope from the AA, and:		May use existing data, or monitor waters as part of this wetland assessment. [NRv, PRv, SRv]
	Downstream	The condition is present within 1 km downslope and connected to the AA by a channel.	0	1
		The condition is present within 5 km downslope and connected to the AA by a channel, or within 1 km but not connected to the AA by a channel.	0	
		Sampling during both low water periods and times with high runoff (storms, snowmelt) indicates no problems in either the AA or inflowing	0	
		waters. Data are insufficient (no or inadequate sampling within 1 km, or condition exists only at >1 km upstream)This is the situation for nearly	1

Form F (Field). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Walk for no less than 10 minutes from the wetland edge towards its core, in the part of the AA that is proposed for alteration. If no alteration is proposed, walk in a portion that appears to be most representative of the wetland overall. Walk only where it is safe and legal to do so. Conduct the assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answer these questions primarily based on your onsite observations and interpretations. Do not write in shaded parts of this data form. Answering some questions accurately may require conferring with the landowner or other knowledgable persons and/or reviewing aerial imagery. For most wetlands, completing this field data form will require 1-2 hours on a site. For a list of functions to which each question pertains, see the accompanying Interpretations form. For detailed descriptions of each WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage & Delay, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity, STR= Stressors.

	to die	Condition of the	ъ.	Definition In 1 11
#	Indicators	Condition Choices	Data	Definitions/Explanations
1	Wetland Type	Follow the key below and mark the ONE row that best describes MOST of the vegetated part of the AA:		Ericaceous shrubs are ones in the heather family (Ericaceae). Most have leathery evergreen leaves. They include rhododendron, azalea, swamp laurel, leatherleaf, Labrador tea, and others. Most require
		A. Moss and/or lichen cover more than 25% of the ground. Often dominated by ericaceous shrubs (e.g., Labrador tea) or other acid-tolerant plants (e.g., bog caraberry, pitcher plant, surdiew, orchids). Substrate is mostly undecomposed peat. Choose between A1 and A2 and mark the choice with a 1 in their adjoining column. Otherwise go to B below.		acidic soil. Although not in the family Ericaceae, sweetgale (<i>Myrica gale</i>) should be counted also. [AM, CS, FA, FR, INV, NR, OE, PH, Sens, SFS, WBF, WBN]
		A1. Surface water is usually absent or, if present, pH is typically <4.5 and conductivity is usually <100 µS/cm (<64 ppm TDS). Trees are absent or nearly so. Sedge cover usually sparse or absent but cottongrass and/or lichen cover may be extensive, as well as cloudberry, lingonberry, sheep laurel, and a sedge (Carex rariflora). Welland surface and surrounding landscape are seldom sloping and welland often is domed (convex). Inlet and outlet channels are usually absent. If known, pH of peat is <4.0.	0	
		A2. Not A1. Surface water, if present, has pH typically >4.5 and conductivity is usually >100 µS/cm (>64 ppm TDS). Sedge cover is usually extensive, and/or tree and tall shrub cover is extensive. Sometimes at toe of slope or edge of water body. An exit channel is usually present. Wetter than A1 and peat depth may be shallower (<2 m).	1	
		B. Moss and/or lichen cover less than 25% of the ground. Soil is mineral or decomposed organic (muck). Choose between B1 and B2 and mark the choice with a 1 in their adjoining column:		
		B1. Trees and shrubs taller than 1 m comprise more than 25% of the vegetated cover. Surface water is mostly absent or inundates the vegetation only seasonally (e.g., vernal pools or floodplain).	0	
		B2. Not B1. Tree & tall shrubs comprise less than than 25% of the vegetated cover. Vegetation is mostly herbaceous, e.g., cattail, bufrush, burreed, pond lily, horsetail. Surface water may be extensive and fluctuates seasonally, being either persistent or drying up partly or entirely.	0	
		he AA should include all persistent waters in ponds smaller than 8 hectares (-283 m on a side) that are adjacent to the AA. The		
ncludi a dja d lescri	e the open water part adj cent " is used synonymo bed features along their i	the water area of adjacent ponded water larger than 8 ha and adjacent rivers wider than 20 m. Specifically, the AA should iacent to wetland vegetation and equal in width to the average width of that vegetated zone. Throughout this data form, usly with abutting, adjoining, bordering, confusous and means no upland (manmade or natural) completely separates the directly shared edge. Features joined only by a channel are not necessarily considered to be adjacent a large portion of their es do not have to be hydrologically connected in order to be considered adjacent.		
2	Wetland Types - Adjoining or Subordinate	If the AA is smaller than 1 ha, mark all other types that occupy more than 1% of the vegetated AA. If the AA is larger than 1 ha, mark all other types which are within or adjacent to the AA and occupy more than 1 ha, as visible from the AA or as interpreted from aerial imagery. Do not mark again the type marked in F1.		1 hectare is 10,000 sq. m or about 2.5 acres. It could have dimensions of 100 m by 100 m, 1000 m by 10 m, or similar. [AM, INV, SBM, WBF]
		A1.	0	
		A2. B1.	0	
		B2.	0	
3	Woody Height & Form Diversity	Following EACH row below, indicate with a number code the percentage of the living vegetation in the AA which is occupied by that feature (6 if >95%, 5 if 75-95%, 4 if 50-75%, 3 if 25-50%, 2 if 5-25%, 1 if <5%, 0 if none). If the vegetated part of the AA is largely herbaceous (non-woody) vegetation, these percentages should not sum to 100%.		Deciduous shrubs in this region usually include buttonbush, Labrador tea, bayberry (Morella), huckleberry, cranberry, cloudberry, sweetgale, alder, willow, birch, ash, dogwood, and a few others. If you assigned a code of 3 or higher to any of the first four choices and the ground cover beneath the trees/shrubs is <25% moss, then question F1 might be "B1". (CS, NV, NR, PH, POL, SBM, Sens)
		coniferous trees (may include tamarack) taller than 3 m. deciduous trees taller than 3 m.	5	ueesisiiruus is 523% iiioss, tiieri quesitoit i Tiingrit de DT. [C3, IIVV, IVIV, FTI, FOE, 3500, 3eiis]
		coniferous or ericaceous shrubs or trees 1-3 m tall not directly below the canopy of trees.	3	
		deciduous shrubs or trees 1-3 m tall not directly below the canopy of trees.	1	
		coniferous or ericaceous shrubs <1 m tall not directly below the canopy of taller vegetation. deciduous shrubs or trees <1 m tall (e.g., deciduous seedlings) not directly below the canopy of taller vegetation.	2	
lote :	If none of top 4 rows in	F3 was marked 2 or greater, SKIP to F9 (N fixers).		
4	Dominance of Most	Determine which two woody plant species comprise the greatest portion of the low (<3 m) woody cover . Then choose one:		[PH, POL, SBM, Sens]
	Abundant Shrub Species	those species together comprise > 50% of such cover.	1	
-		those species together do not comprise > 50% of such cover. Mark ALL the types that comprise >5% of the woody canopy cover in the AA or >5% of the wooded areas (if any) along its upland edge	0	
J	Woody Diameter Classes	India ALC the types had comprise 25% of the woody Carropy cover in the AA of 25% of the wooded aleas (it any) along its uplantil edge (perimeter). The edge should include only the frees whose canopies extend into the AA. conferous. 19 cm diameter and >1 m fall.	1	Estimate the diameters at chest height. If small-diameter trees are overtopped (shaded) by larger ones, visualise a "subcanopy" at the average height of the smaller-dbh trees, to serve as a basis for minimum 5% canopy requirement in this question. The trees and shrubs need not be wetland specie
		broad-leaved deciduous 1-9 cm diameter and >1 m tall.	1	[AM, CS, POL, SBM, Sens, WBN]
		coniferous, 10-19 cm diameter.	1	
		broad-leaved deciduous 10-19 cm diameter. coniferous, 20-40 cm diameter.	1	
		broad-leaved deciduous 20-40 cm diameter.	1	
		coniferous, >40 cm diameter.	1	
	Height Class	broad-leaved deciduous >40 cm diameter. Follow the key below and mark the ONE row that best describes MOST of the AA:	1	[AM, INV, NR, PH, SBM, Sens]
6		Tollow the key below and mark the one row that best describes worst of the Ave.		[Part, 1844, 1844, 171, John, John]
6	Interspersion	A. Neither the vegetation taller than 1 m nor the vegetation shorter than that comprise >70% of the vegetated part of the AA. They each comprise 30-70%. Choose between A1 and A2 and mark the choice with a 1 in the adjoining column. Otherwise go to B below.		
6		comprise 30-70%. Choose between A1 and A2 and mark the choice with a 1 in the adjoining column. Otherwise go to B below. A1. The two height classes are mostly scattered and intermixed throughout the AA.	0	
6		comprise 30-70%. Choose between A1 and A2 and mark the choice with a 1 in the adjoining column. Otherwise go to B below. A1. Either the vegetation shorter than 1 in comprises > 70% of the vegetated part of the AA, or the vegetation taller than that does. One size class might even be totally absence. Choose between B1 and B2 and mark the choice with a 1 in the adjoining column: B1. The less prevalent height class is mostly scattered and intermixed within the prevalent one.	0	
7	Interspersion	comprise 30-70%. Choose between A1 and A2 and mark the choice with a 1 in the adjoining column. Otherwise go to B below. A1. The two height classes are mostly scattered and intermixed throughout the AA. A2. Not A1. The two height classes are mostly in separate zones or bands, or in proportionately large clumps. B. Either the vegetation shorter than 1 m comprises >70% of the vegetated part of the AA, or the vegetation taller than that does. One size class might even be totally absent. Choose between B1 and B2 and mark the choice with a1 in the adjoining column: B1. The less prevalent height class is mostly scattered and intermixed within the prevalent one. B2. Not B1. The less prevalent height class is mostly located apart from the prevalent one, in separate zones or clumps, or is completely absent. The number of large snags (diameter >20 cm) in the AA plus adjacent upland area within 10 m of the wetland edge is: None, or fewer than 8/ hectare which exceed this diameter.	0	Snags are dead standing trees that often (not always) lack bark and foliage. Include only ones that at at least 2 m tall. [POL, SBM, WBN]
7	Interspersion Large Snags (Dead	comprise 30-70%. Choose between A1 and A2 and mark the choice with a 1 in the adjoining column. Otherwise go to B below. A1. The two height classes are mostly scattered and intermixed throughout the AA. A2. Not A1. The two height classes are mostly in separate zones or bands, or in proportionately large clumps. B. Either the vegetation shorter than 1 m comprises > 70% of the vegetated part of the AA, or the vegetation taller than that does. One size class might even be totally absent. Choose between B1 and B2 and mark the choice with a 1 in the adjoining column: B1. The less prevalent height class is mostly scattered and intermixed within the prevalent one. B2. Not B1. The less prevalent height class is mostly located apart from the prevalent one, in separate zones or clumps, or is completely-absent. The number of large snags (diameter >20 cm) in the AA plus adjacent upland area within 10 m of the wetland edge is: None, or fewer than 8/ hectare which exceed this diameter. Several (>8/hectare) and a pond, lake, or slow-flowing water wider than 10 m is within 1 km.	0 0 0	
7	Interspersion Large Snags (Dead Standing Trees)	comprise 30-70%. Choose between A1 and A2 and mark the choice with a 1 in the adjoining column. Otherwise go to B below. A1. The two height classes are mostly scattered and intermixed throughout the AA. A2. Not A1. The two height classes are mostly in separate zones or bands, or in proportionately large clumps. B. Either the vegetation shorter than 1 m comprises > 70% of the vegetated part of the AA, or the vegetation taller than that does. One size class might even be totally absent. Choose between B1 and B2 and mark the choice with a 1 in the adjoining column: B1. The less prevalent height class is mostly scattered and intermixed within the prevalent one, in separate zones or clumps, or is completely absent. B2. Not B1. The less prevalent height class is mostly located apart from the prevalent one, in separate zones or clumps, or is completely absent. The number of large snags (diameter > 20 cm) in the AA plus adjacent upland area within 10 m of the wetland edge is: None, or fewer than 8/ hectare which exceed this diameter. Several (>8/hectare) and a pond, lake, or slow-flowing water wider than 10 m is within 1 km. Several (>8/hectare) but above not true.	0 0	at least 2 m tall. [POL, SBM, WBN]
7	Interspersion Large Snags (Dead	comprise 30-70%. Choose between A1 and A2 and mark the choice with a 1 in the adjoining column. Otherwise go to B below. A1. The two height classes are mostly scattered and intermixed throughout the AA. A2. Not A1. The two height classes are mostly in separate zones or bands, or in proportionately large clumps. B. Either the vegetation shorter than 1 m comprises > 70% of the vegetated part of the AA, or the vegetation taller than that does. One size class might even be totally absent. Choose between B1 and B2 and mark the choice with a 1 in the adjoining column: B1. The less prevalent height class is mostly scattered and intermixed within the prevalent one. B2. Not B1. The less prevalent height class is mostly located apart from the prevalent one, in separate zones or clumps, or is completely-absent. The number of large snags (diameter >20 cm) in the AA plus adjacent upland area within 10 m of the wetland edge is: None, or fewer than 8/ hectare which exceed this diameter. Several (>8/hectare) and a pond, lake, or slow-flowing water wider than 10 m is within 1 km.	0 0 0	Snags are dead standing trees that often (not always) lack bark and foliage. Include only ones that ar at least 2 m tall. [POL, SBM, WBN] Exclude temporary "burn piles." [AM, INV, POL, SBM]

FieldF form - Non-tidal Page 1 of 5

FO	N Fixers	The percentage of the AA's vegetated cover that contains nitrogen-fixing plants (e.g., alder, sweetgale, clover, lupine, alfalfa, other legumes)		Do not include N-fixing algae or lichens. [FA, FR, INV, NRv, OE, PH, SBM, Sens]
1 7	IN FIXEIS	is:		DO NOT INCIDIDE NATIONAL BASE OF INCIDENTS. [F.A., F.N., 1000, 1000, 1000, 3000, 3000, 3000]
		<1% or none.	0	
		1-25% of the vegetated cover, in the AA or along its water edge (whichever has more).	1	
		25-50% of the vegetated cover, in the AA or along its water edge (whichever has more). 50-75% of the vegetated cover, in the AA or along its water edge (whichever has more).	0	
		>75% of the vegetated cover, in the AA or along its water edge (whichever has more).	0	
F10	Sphagnum Moss	The cover of Sphagnum moss (or any moss that forms a dense cushion many centimeters thick), including the moss obscured by taller		Exclude moss growing on trees and rocks. [CS, PH]
	Extent	sedges and other plants rooted in it, is:		
		<5% of the vegetated part of the AA.	0	
		5-25% of the vegetated part of the AA. 25-50% of the vegetated part of the AA.	0	
		50-95% of the vegetated part of the AA.	1	
		>95% of the vegetated part of the AA.	0	
F11	% Bare Ground &	Consider the parts of the AA that lack surface water at the driest time of the growing season. Viewed from directly above the ground layer, the		Thatch is dead plant material (stems, leaves) resting on the ground surface. Bare ground that is
	Thatch	predominant condition in those areas at that time is:		present under a tree or shrub canopy should be counted. Boulders count as bare ground. Wetlands with mineral soils and that are heavily shaded or are dominated by annual plant species tend to have
		Little or no (<5%) bare ground is visible between erect stems or under canopy anywhere in the vegetated AA. Ground is extensively blanketed by dense thatch, moss, lichens, graminoids with great stem densities, or plants with ground-hugging foliage.	1	more extensive areas that are bare during the early growing season. [AM, EC, INV, NR, OE, POL, PR, SBM, Sens]
		Slightly bare ground (5-20% bare between plants) is visible in places, but those areas comprise less than 5% of the unflooded parts of the AA.	0	
		Much bare ground (20-50% bare between plants) is visible in places, and those areas comprise more than 5% of the unflooded parts of the AA.	0	
		Other conditions.	0	
F40	0 11 1 1	Not applicable. Surface water (either open or obscured by emergent plants) covers all of the AA all the time.	0	TI I I I I I I I I I I I I I I I I I I
F12	Ground Irregularity	Imagine the AA without any living vegetation. Excluding the portion of the AA that is always under water, the number of hummocks, small pits, raised mounds, animal burrows, ruts, gullies, natural levees, microdepressions, and other areas of peat or mineral soil that are raised or depressed >10 cm compared to most of the area within a few meters surrounding them is:		The depressions may be of human or natural origin. [AM, EC, INV, NR, PH, POL, PR, SBM, SR, WS]
		Few or none (minimal microtopography; <1% of the land has such features, or entire AA is always water-covered).	0	
		Intermediate.	1	
		Several (extensive micro-topography).	0	
F13	Upland Inclusions	Within the AA, inclusions of upland are:		[AM, NR, SBM]
		Few or none.	0	
		Intermediate (1 - 10% of vegetated part of the AA).	1	
		Many (e.g., wetland-upland "mosaic", >10% of the vegetated AA).	0	
F14	Soil Texture	In parts of the AA that lack persistent water, the texture of soil in the uppermost layer is mostly: [To determine this, use a trowel to check in at least 3 widely spaced locations, and use the soil texture key (in Appendix A of the Manual).]		[CS, NR, OE, PH, PR, Sens, SFS, WS]
		Loamy: soils that may contain a little fine grit and do not make a "ribbon" longer than 2 cm when moistened, rolled, squeezed, and extended	0	
		between thumb and forefinger.	Ů	
		Fines: includes silt, clay, silt, soils that make a ribbon longer than 2 cm when moistened, rolled, squeezed, and extended between thumb and	1	
		forefinger. Deep Peat, to 40 cm depth or greater.	0	
		Shallow Peat or organic <40 cm deep.	0	
		Coarse: includes sand, loamy sand, gravel, cobble, soils that do not make a ribbon when moistened, rolled, squeezed, and extended	0	
		between thumb and forefinger.		
F15	Shorebird Feeding Habitats	During any 2 consecutive weeks of the growing season, the extent of mudflats, bare unshaded saturated areas not covered by thatch, and unshaded waters shallower than 6 cm is: [Include also any area that is adjacent to the AA.]		This addresses needs of many but not all migratory sandpipers, plovers, and related species. [WBF]
	Habitats	None, or <100 sq. m.	1	
		100-1000 sq. m.	0	
		1000 – 10,000 sq. m.	0	
F4.6		>10,000 sq. m.	0	CAM MOS MON
F16	Herbaceous % of Vegetated Wetland	In aerial ("ducks eye") view, the maximum annual cover of herbaceous vegetation (all non-woody plants except moss) is:		[AM, WBF, WBN]
		45% of the vegetated part of the AA or <0.01 hectare (whichever is less). Mark "1" here and SKIP to F20 (Invasive Plant Cover). 5-25% of the vegetated part of the AA.	1	
		25-50% of the vegetated part of the AA.	0	
		50-95% of the vegetated part of the AA.	0	
		>95% of the vegetated part of the AA.	0	
F17	Forb Cover	Within parts of the AA having herbaceous cover (excluding SAV), the areal cover of forbs reaches an annual maximum of:		Forbs are flowering plants. Do not include grasses, sedges, cattail, other graminoids, ferns, horsetails,
		<5% of the herbaceous part of the AA.	1	or others that lack showy flowers. [POL]
		5-25% of the herbaceous part of the AA.	0	
		25-50% of the herbaceous part of the AA.	0	
		50-95% of the herbaceous part of the AA. >95% of the herbaceous part of the AA.	0	
F18	Sedge Cover	Sedges (Carex spp.) and cottongrass (Eriophorum spp.) occupy:		[CS]
		<5% of the vegetated area, or none.	0	
		5-50% of the vegetated area.	1	
		50-95% of the vegetated area.	0	
Ec.		>95% of the vegetated area.	0	
F19	Dominance of Most Abundant Herbaceous	Determine which two herbaceous species comprise the greatest portion of the herbaceous cover (excluding mosses and floating-leaved aquatic plants). Then choose one of the following:		For this question, include ferns as well as graminoids and forbs. [EC, INV, PH, POL, Sens]
	Species	those species together comprise > 50% of the areal cover of herbaceous plants at any time during the year.	1	
		those species together do not comprise > 50% of the areal cover of herbaceous plants at any time during the year.	0	
F20	Invasive Plant Cover	How extensive is the cover of invasive plant species in the AA? For species, see Plants_invasive worksheet in the accompanying Supplinfo		[EC, PH, POL, Sens]
		file. Invasive species appear to be absent in the AA, or are present only in trace amount (a few individuals).	0	
		invasive species appear to be absent in the AA, or are present only in trace amount (a rew individuals). Invasive species are present in more than trace amounts, but comprise <5% of herbaceous cover (or woody cover, if the invasives are	1	
		woody).		
		invasive species comprise 5-20% of the herb cover (or woody cover, if the invasives are woody).	0	
		invasive species comprise 20-50% of the herb cover (or woody cover, if the invasives are woody).	0	
F21	Invasive Cover Along	invasive species comprise >50% of the herb cover (or woody cover, if the invasives are woody). Along the wetland-upland boundary, the percent of the upland edge (within 3 m upslope from the wetland) that is occupied by invasive plant.	0	If a plant cannot be identified to species (e.g., winter conditions) but its genus contains an exotic
1	Upland Edge	Adong the welland-optiand boundary, the percent of the optiand edge (within 3 in opsidee from the welland) that is occupied by invasive plant species is:		species, assume the unidentified plant to also be exotic. If vegetation is so senesced that exotic
		none of the upland edge (invasives apparently absent), or AA has no upland edge.	0	species cannot be identified, answer "none". [PH, STR]

	Lacustrine Wetland	The vegetated part of the AA is within or adjacent to a body of non-tidal standing open water whose size exceeds 8 hectares during most of	0	[FR, PR, PU, WBF, WBN]
F23		a normal year.		

FieldF form - Non-tidal Page 2 of 5

F24	% of AA Without Surface Water	The percentage of the AA that never contains <u>surface</u> water during an average year (that is, except perhaps for a few hours after snowmelt or rainstorms), but which is still a wetland, is:		1 hectare is 10,000 sq. m or about 2.5 acres. It could have dimensions of 100 m by 100 m, 1000 m by 10 m, or similar. [AM, FA, FR, INV, NR, PH, PR, SBM, Sens, SRv, WBF, WBN, WC]
		<1% . In other words, all or nearly all of the AA is covered by water permanently or at least seasonally.	0	
		1-25% of the AA, or <1% but >0.01 ha never contains surface water. 25-50% of the AA never contains surface water.	0	
		50-75% of the AA never contains surface water.	0	
		75-99% of the AA never contains surface water, or >99% AND there is at least one persistent water body larger than 1 ha in the AA.	0	
		99-100%. AND there is no persistent ponded water body larger than 1 ha within the AA. Enter *1* and SKIP to F42 (Channel Connection).	0	
F25	% of AA with Persistent Surface Water	Identify the parts of the AA that still contain surface water (flowing or ponded, open or hidden beneath vegetation) even during the driest times of a normal year, i.e., when the AA's surface water is at its lowest annual level. At that time, the percentage of the AA that still contains surface water is:		If you are unable to determine the condition at the driest lime of year, ask the land owner or neighbors about it if possible. Indicators of persistence may include fish, some dragonflies, beaver, and muskrat. [AM, CS, FA, FR, INM, NR, POL, PR, SBM, WBF, WBN]
		None. The AA dries up completely (no water in channels either) or never has surface water during most years. SKIP to F27.	0	
		1-20% of the AA.	0	
		20-50% of the AA. 50-95% of the AA.	0	
		>95% of the AA. True for many fringe wetlands.	0	
F26	% of Summertime Water that Is Shaded	At mid-day during the warmest time of year, the area of surface water <u>within</u> the AA that is shaded by vegetation and other features that are <u>within</u> the AA at that time is:		[FA, WC]
	water that is shaded	<5% of the water is shaded, or no surface water is present then.	0	
		5-25% of the water is shaded.	1	
		25-50% of the water is shaded. 50-75% of the water is shaded.	0	
		>75% of the water is shaded.	0	
F27	% of AA that is	The percentage of the AA's area that is between the annual high water and the annual low water (surface water) is:		Flood marks (algal mats, adventitious roots, debris lines, ice scour, etc.) are often evident when not
	Flooded Only Seasonally	None, or <0.01 hectare and <1% of the AA. SKIP to F29.	0	fully inundated. Also, such areas often have a larger proportion of upland and annual (vs. perennial) plant species. In riverine systems, the extent of this zone can be estimated by multiplying by 2 the
	Seasonally	1-20% of the AA, or <1% but >0.01 ha.	0	bankful height and visualising where that would intercept the land along the river. [CS, FA, INV, NR,
		20-50% of the AA. 50-95% of the AA.	0	OE, PH, SR, WBF, WBN, WS]
		>95% of the AA.	0	1
F28	Annual Water	The annual fluctuation in surface water level within most of the parts of the AA that contain surface water at least temporarily is:		Look for flood marks (see above). Because the annual range of water levels is difficult to estimate
	Fluctuation Range	<10 cm change (stable or nearly so).	0	without multiple visits, consider asking the land owner or neighbors about it. [AM, CS, INV, NR, OE, PH, PR, SR, WBN, WS]
		10 cm - 50 cm change.	1	.,,,
		0.5 - 1 m change. 1-2 m change.	0	-
		>2 m change.	0	1
Is the a		d water smaller than 0.01 hectare (about 10m x 10m, or 1m x 100 m)? If so, enter *1* in column D and SKIP TO F42	0	
F29	Predominant Depth Class	During most of the time when surface water is present during the growing season, its depth, averaged over the entire inundated part of the AA, is:		If a boat is unavailable, estimate this by considering wetland size and local topography. Or if timing and safety allow, depths may be measured by drilling through winter ice. This question is asking about the
	Class	<10 cm deep (but >0).	0	spatial median depth that occurs during most of that time, even if inundation is only seasonal or
		10 - 50 cm deep.	1	temporary. If inundation in most but not all of the wetland is brief, the answer will be based on the depth of the most persistently inundated part of the wetland. Include surface water in channels and ditches as
		0.5 - 1 m deep.	0	well as ponded areas. [CS, FA, FR, INV, OE, PH, PR, Sens, SFS, SR, WBF, WBN, WC]
		1 - 2 m deep. >2 m deep. True for many fringe wetlands.	0	-
F30	Depth Classes -	When present, surface water in most of the AA usually consists of (select one):		Estimate these proportions by considering the gradient and microtopography of the site. [FR, INV,
	Evenness of	One depth class that comprises >90% of the AA's inundated area (use the classes in the question above).	0	WBF, WBN]
	Proportions	One depth class that comprises 50-90% of the AA's inundated area.	0	
F31	% of Water That Is	Neither of above. There are 3 or more depth classes and none occupy >50%. During most times when surface water is present, the percentage that is (1) ponded (stagnant, or flows so slowly that fine sediment is not	1	Nearly all wetlands with surface water have some ponded water. [AM, CS, INV, NR, OE, PR, Sens, SR,
131	Ponded (not Flowing)	bolling into lines with some solitace water is present, the percentage rate is (1) pointed straight and, or nows so sowny that the sediments in held in suspension) AND (2) is likely to be deeper than 0.5 m in some places, is: -5% of the water, or it occupies <100 s.g.m cumulatively. Nearly all the surface water is flowing. SKIP to F34.	0	WBF, WBN, WC, WS]
		5-30% of the water.	0	1
		30-70% of the water.	1	
		70.95% of the water. >95% of the water.	0	
F32	Ponded Open Water - Minimum Size	System of the growing season, the largest patch of open water that is ponded and is in or bordering the AA is >0.01 hectare (about 10 m by 10 m) and mostly deeper than 0.5 m. If true enter "1" and continue, If false, enter "0" and SKIP to F41 (Floating Algae & Duckweed).	0	Open water is not obscured by vegetation in aerial ("duck's eye") view. It includes vegetation floating on the water surface or entirely submersed beneath it.
F33	% of Ponded Water that is Open	In ducks-eye aerial view, the percentage of the ponded water that is open (lacking emergent vegetation during most of the growing season, and unhidden by a forest or shrub canopy) is:		[AM, CS, FA, FR, INV, NR, OE, PR, SR, WBF, WBN, WC]
		None, or <1% of the AA and largest pool occupies <0.01 hectares. Enter "1" and SKIP to F41 (Floating Algae & Duckweed).	0	1

F37	Interspersion of	During most of the part of the growing season when water is present, the spatial pattern of emergent vegetation within the water is mostly:		[AM, FA, FR, INV, NR, OE, PH, PR, SBM, SR, WBF, WBN]
	Emergents & Open			
	Water	Scattered. More than 30% of such vegetation forms small islands or corridors surrounded by water. Intermediate.	0	
		Clumped. More than 70% of such vegetation is in bands along the wetland perimeter or is clumped at one or a few sides of the surface water	0	
F38	Persistent Deepwater	area. If the deepest patch of surface water (flowing or ponded) in or directly adjacent to the AA is mostly deeper than 0.5 m for >2 weeks during the	0	
	Area	growing season, enter *1* and continue. If not, enter *0* and SKIP to F42.(Connection).		
F39	Non-vegetated Aquatic Cover	During most of the growing season and in waters deeper than 0.5 m, the cover for fish, aquatic invertebrates, and/or amphibians that is provided NOT by living vegetation, but by accumulations of dead wood and undercut banks is:		For this question, consider only the wood that is at or above the water surface. Estimates of underwater wood based only on observations from terrestrial viewpoints are unreliable so should not be attempted.
		Little or none.	0	[AM, FA, FR, INV]
		Intermediate. Extensive.	0	
F40	Isolated Island	The AA contains (or is part of) an island or beaver lodge within a lake, pond, or river, and is isolated from the shore by water depths >1 m on	0	[WBN]
		all sides during an average June. The island may be solid, or it may be a floating vegetation mat that is sufficiently large and dense to support a waterbird nest.		
F41	Floating Algae & Duckweed	At some time of the year, mats of algae and/or duckweed are likely to cover >50% of the AA's otherwise-unshaded water surface, or blanket >50% of the underwater substrate. If true, enter "1" in next column. If untrue or uncertain, enter "0".	0	[EC, PR, WBF]
F42	Channel Connection & Outflow Duration	The most persistent surface water connection (outlet channel or pipe, ditch, or overbank water exchange) between the AA and a downslope stream network is: [Note: If the AA represents only part of a wetland, answer this according to whichever is the least permanent surface connection: the one between the AA and the rest of the wetland, or the surface connection between the wetland and the downslope stream network.] Persistent (surface water flows out for >9 months/year).	1	Consider the connection regardless of whether the surface water is frozen. The "downslope stream network" could consist of ditches, rivers, ponds, or lakes which eventually connect to the ocean. If this cannot be determined white visiting the AA, consult topographic maps perhaps by viewing these online with Toporama (http://atlas.nrcan.gc.ca/hoporama/en/index.html) [CS, FA, FR, NR, OE, PR, Sens, SFS SR, WCv, WS]
		Seasonal (surface water flows out for 14 days to 9 months/year, not necessarily consecutive).	0	
		Temporary (surface water flows out for <14 days, not necessarily consecutive). None but maps show a stream network downslope from the AA and within a distance that is less than the AA's length. SKIP to F47 (pH	0	
		Measurement).		
		No surface water flows out of the wetland except possibly during extreme events (<once (ph="" 10="" a="" an="" ditch,="" f47="" flows="" into="" lacks="" lake="" measurement).<="" only="" or="" or,="" outlet.="" per="" skip="" td="" that="" to="" water="" wetland,="" years).=""><td>0</td><td></td></once>	0	
F43	Outflow Confinement	During major runoff events, in the places where surface water exits the AA or connected waters nearby, the water:		"Major runoff events" would include biennial high water caused by storms and/or rapid snowmell. [CS, NR, OE, PR, Sens, SR, STR, WS]
		Mostly passes through a pipe, culvert, narrowly breached dike, berm, beaver dam, or other partial obstruction (other than natural topography) that does not appear to drain the wetland artificially during most of the growing season.	0	int, OL, FR, 3013, 31K, 31K, W3J
		Leaves through natural exits (channels or diffuse outflow), not mainly through artificial or temporary features.	1	
		Is exported more quickly than usual due to ditches or pipes within the AA or connected to its outlet, or within 10 m of the AA's edge, which drain the wetland artificially, or water is pumped out of the AA.	0	
F44	Tributary Channel	At least once annually, surface water from a tributary channel that is >100 m long moves into the AA. Or, surface water from a larger permanent water body adjacent to the Aspills into the AA. If it enters only via a pipe, that pipe must be fed by a mapped stream or lake further upsigoe, if no, SKIP to F47 (bH Measurement).	1	If inlet tributaries cannot be searched for due to inaccessibility of part of the AA, follow suggestions in F42 above. [NRv, PH, PRv, SRv]
F45	Input Water	Based on lack of shade, water source characteristics, or actual temperature measurements, the inflow is likely to be warmer than surface	0	[WCv]
	Temperature	water in the AA during part of most years. Enter 1= yes, 0= no.		
F46	Throughflow	During its travel through the AA at the time of peak annual flow, water arriving in channels: [select only the ONE encountered by most of the		[FA, FR, INV, NR, OE, PR, SR, WS]
	Resistance	incoming water]. Does not bump into many plant stems as it travels through the AA. Nearly all the water continues to travel in unvegetated (often incised)	0	
		channels that have minimal contact with wetland vegetation, or through a zone of open water such as an instream pond or lake.	Ü	
		Bumps into herbaceous vegetation but mostly remains in fairly straight channels.	0	
		Bumps into herbaceous vegetation and mostly spreads throughout, or is in widely meandering, multi-branched, or braided channels.	0	
		Bumps into tree trunks and/or shrub stems but mostly remains in fairly straight channels.	0	
		Bumps into tree trunks and/or shrub stems and follows a fairly indirect path from entrance to exit (meandering, multi-branched, or braided).	1	
F47	pH Measurement	The pH in most of the AA's surface water:		Preferably, measure this in larger areas of ponded surface water within the AA, or in streams that have
		Was measured, and is: [enter the reading in the column to the right.]		passed through (not along) most of the AA. Unless surface water is completely absent, do not dig holes or make depressions in peat in order to provide water for this measurement. Avoid measuring near
		Was not measured but surface water is present and is darkly tea-coloured. Or if no surface water, then mosses and plants that indicate peatland (e.g., Labrador tea) are prevalent. Enter "1".	0	roads or in puddles formed only by recent rain. [AM, FA, FR, NR, WBF, PH, PR, Sens, WBF, WBN]
		Neither of above. Enter *1*.	1	
F48	TDS and/or Conductivity	The TDS (total dissolved solids) or conductivity off the AA's surface water is: (select the first true row with information):		See above for measurement guidance. [FR, INV, NRv, PH, PRv, Sens]
		TDS is: [Enter the reading in ppm or mg/L in the column to the right, if measured, or answer next row.] Conductivity is [Enter the reading in µS/cm in the column to the right.]		
		Was not measured, but plants that indicate saline conditions cover much of the vegetated AA. Enter "1".	0	
F49	Beaver Probability	Neither of above Use of the AA by beaver during the past 5 years is (select most applicable ONE):	1	[FA, FR, PH, SBM, Sens, WBF, WBN]
		Evident from direct observation or presence of gnawed limbs, dams, tracks, dens, lodges, or extensive stands of water-killed trees (snags).	0	
		Likely based on known occurrence in the region and proximity to suitable habitat, which may include: (a) a persistent freshwater wetland,	1	
		pond, or lake, or a perennial low or mid-gradient (<10%) channel, and (b) a corridor or multiple stands of hardwood trees and shrubs in	•	
		vegetated areas near surface water. Unlikely because site characteristics above are deficient, and/or this is a settled area or other area where beaver are routinely removed.	0	
F50	Groundwater Strength	Select first applicable choice:		Adhere to these criteria strictly do not use personal judgment based on fen conditions, pH, or other
	of Evidence	Springs are known to be present within the AA, or if groundwater levels have been monitored, that has demonstrated that groundwater primarily discharges to the wetland for longer periods during the year than periods when the wetland recharges the groundwater.	0	evidence. Consult lopographic maps to detect breaks in slope described here. Rust deposits associated with groundwater seeps may be most noticeable as orange discoloration in ice formations along streams during early winter. [AM, CS, FA, FR, INV, NR, OE, PH, PRv, SFS, WC, WS]
		Most of the AA has a slope of >5%, or is very close to the base of a natural slope longer than 100 and much steeper than the slope of the AA, AND the pH of surface water, if known, is >5.5. Neither of above is true, although some groundwater may discharge to or flow through the AA. Or groundwater influx is unknown.	0	
F51	Internal Gradient	Neither of above is true, although some groundwater may discharge to or flow through the AA. Or groundwater influx is unknown. The gradient along most of the flow path within the AA is:	1	This is not the same as the shoreline slope. It is the elevational difference between the AA's inlet and
		<2% or the AA has no surface water outlet (not even seasonally).	1	outlet, divided by the flow-distance between them and converted to percent. If available, use a clinometer to measure this. Free clinometer apps can be downloaded to smartphones. If the wetland is
		2-5%. 6-10%.	0	large (longer than -1 km), this may be estimated using Google Earth to determine the minimum and
		>10%.	0	maximum elevation within the AA, then dividing by length and multiplying by 100. [CS, NR, OE, PR, SR, WBF, WBN, WS]
		ions: If the AA lacks an upland edge, evaluate based on the AA's entire perimeter, and moving outward into whatever areas are		
adjace F52		nese questions are best answered by measuring from aerial images. Within a zone extending 30 m laterally from the AA's edge with upland and/or other wetlands, the percentage that contains perennial		[AM, FA, FR, INV, NRv, PH, POL, PRv, SBM, Sens, SRv, STR, WBN]
	of Perimeter	vegetation cover (except lawns, row crops, heavily grazed land, conifer plantations) is:		
		<5%. 5 to 30%.	0	
		30 to 60%.	0	
		60 to 90%.	0	
		>90%, or all the area within 30 m of the AA edge is other wetlands. SKIP to F55.	- 1	

FieldF form - Non-tidal Page 4 of 5

53	Type of Cover in Buffer	Within 30 m upslope of where the wetland transitions to upland, the upland land cover that is NOT perennial vegetation is mostly (mark ONE):		[AM, FA, INV, NRv, PH, POL, SBM, STR, WBN]
	. ypo or oover at ballor			
		Impervious surface, e.g., paved road, parking lot, building, exposed rock.	1	
		Bare or nearly bare pervious surface or managed vegetation, e.g., lawn, row crops, unpaved road, dike, landslide.	0	
54	Buffer Slope	The steepest and/or most disturbed part of the upland area that is within 30 m of the wetland and occupies >10% of that upland area has a percent slope of:		[NRv, PRv, Sens, SRv]
		<1% (flat almost no noticeable slope) or all the area within 30 m of the AA edge is other wetlands.	0	
		2-5%.	1	
		5-30%. >30%.	0	
55	Cliffs or Steep Banks	in the AA or within 100 m, there are elevated terrestrial features such as cliffs, talus slopes, stream banks, or excavated pits (but not riprap)	0	Do not include upturned trees as potential den sites. [POL, SBM]
33	Cillis of Steep Bariks	In the zero within 1 to m, there are executed tentation retained south as class, didus suppes, stream usins, or executeur pins (our not pinply) that extend at least 2 m nearly vertically, are unvegetated, and potentially contain crevices or other substrate suitable for nesting or den areas. Enter 1 (yes) or 0 (no).	O	DO NOT INCLUDE uprunited wees as potential delt sites. [FOL, Sum]
56	New or Expanded Wetland	Human actions within or adjacent to the AA have persistently expanded a naturally occurring wetland or created a wetland where there previously was none (e.g., by excavation, impoundment):		Determine this using historical aerial photography, old maps, soil maps, or permit files as available [CS NR, OE, PH, Sens]
		No.	0	-
		Yes, and created or expanded 20 - 100 years ago. Yes, and created or expanded 3-20 years ago.	0	
		Yes, and created or expanded vistoin last 3 years.	0	
		Yes, but time of origin or expansion unknown.	0	1
		Unknown if new or expanded within 20 years or not.	0	1
57	Burn History	More than 1% of the AA's previously vegetated area:		Look for charred soil or stumps (in multiple widely-spaced locations) or ask landowner. [CS, PH, STR]
		Burned within past 5 years.	0	1
		Burned 6-10 years ago.	0	1
		Burned 11-30 years ago.	0	
		Burned >30 years ago, or no evidence of a burn and no data.	1	
58	Visibility	The maximum percentage of the welland that is visible from the best vantage point on public roads, public parking lots, public buildings, or public maintained trails that intersect, adjoin, or are within 100 m of the AA (select one) is:		[PU, STR, WBFv]
		<25%. 25-50%.	0	
		>50%.	0	-
59	Non-consumptive	Assuming access permission was granted, select ALL statements that are true of the AA as it currently exists:		[PU, STR]
	Uses - Actual or		1	
	Potential	For an average person, walking is physically possible in (not just near) >5% of the AA during most of the growing season, e.g., free of deep water and dense shrub thickets.		
		Maintained roads, parking areas, or foot-trails are within 10 m of the AA, or the AA can be accessed part of the year by boats arriving via contiguous waters. Within or near the AA, there is an interpretive center, trails with interpretive signs or brochures, and/or regular guided interpretive tours.	0	
60	Unvisited Core Area	The percentage of the AA almost never visited by humans during an average growing season probably comprises: [Note: Only include the part actually walked or driven (not simply viewed from) with a vehicle or boat. Do not include visitors on trails outside of the AA unless more than half the wetland is visible from the trails and they are within 30 m of the wetland edge. In that case include only the area occupied by the trail.]		[AM, FAv, FRv, PH, PU, SBM, STR, WBF, WBN]
		<5% and no inhabited building is within 100 m of the AA.	0	
		<5% and inhabited building is within 100 m of the AA.	0	1
		5-50% and no inhabited building is within 100 m of the AA.	0	
		5-50% and inhabited building is within 100 m of the AA.	0	
		50-95%, with or without inhabited building nearby.	0	1
		>95% of the AA with or without inhabited building nearby.	1	
61	Frequently Visited Area	The part of the AA visited by humans almost daily for several weeks during an average growing season probably comprises: [See note above.]	1	[AM, PH, PU, SBM, STR, WBF, WBN]
		<5%. If F60 was answered ">95%" (mostly never visited), SKIP to F64. 5-50%.	0	
		50·95%.	0	1
		>95% of the AA.	0	1
62	BMP - Soils	Boardwalks, paved trails, fences or other infrastructure and/or well-enforced regulations appear to effectively prevent visitors from walking on soil within nearly all of the AA when the soil is unfrozen. Enter "1" if true.	0	[PH, PU]
63	BMP - Wildlife Protection	Fences, observation blinds, platforms, paved traits, exclusion periods, and/or well-enforced prohibitions on motorised boats, off-leash pets, and off road vehicles appear to effectively exclude or divert visitors and their pets from the AA at critical times in order to minimize disturbance of wildlife (except during hunting seasons). Enter "1" if true.	0	[AM, PU, WBF, WBN]
64	Consumptive Uses	Recent evidence was found within the AA of the following potentially-sustainable consumptive uses. Select ALL that apply.		[FAv, FRv, WBFv]
	(Provisioning Services)	Low-impact commercial timber harvest (e.g., selective thinning).	0	1
		Commercial or traditional-use harvesting of native plants, their fruits, or mushrooms.	0	
		Waterfowl hunting.	0	_
		Fishing.	0	1
		Trapping of furbearers.	0	
40	D	None of the above. The elegant walls or water hading that surrouth provide disking water are:	1	MDd
65	Domestic Wells	The closest wells or water bodies that currently provide drinking water are:		[NRv]
		Within 0-100 m. of the AA.	0	
		100-500 m. away.	0	
- 4.4	Colograpus F	>500 m. away, or no information. The AA is as in part of a calcacause for See the Dients Colcar worksheet in the accompanying Supplies file for list of plant indicators.	1	[DL DD]
66	Calcareous Fen	The AAIs, or is part of, a calcareous fen. See the Plants, Calcar worksheel in the accompanying Supplinto file for list of plant indicators (calciphiles). Enter 1 if more than two Strong or more than five Moderate calciphile species are present; otherwise enter 0, but if not able to identify those and no information, change to blank.	0	[PH, PR]

essor (S) Data Form for Non-Tidal		D.	ate: 9 October 2019
cosor (o) Buta i offili for Noti-fidal	Wetlands WESP-AC for New B	runswick Version 2	
Aborrent Timing of Mater Innuts	Wettarius: WEST-ACTOT NEW B	Turiswick. Version 2.	
Aberrant Timing of Water Inputs			
In the last column, place a check mark next to any item that is likely a more temporal homogeneity of flow or water levels) or more flashy (l.			nuted (smaller or less frequent peaks spread over longer times
Stormwater from impervious surfaces that drains directly to the wetl			
Water subsidies from wastewater effluent, septic system leakage, s	snow storage areas, or irrigation.		
Regular removal of surface or groundwater for irrigation or other con	insumptive use.		
Flow regulation in tributaries or water level regulation in adjoining w	rater body, or other control structure at water entry points that regu	ulates inflow to the wetland.	
A dam, dike, levee, weir, berm, or fill within or downgradient from	the wetland that interferes with surface or subsurface flow in/ou	at of the AA (e.g., road fill, wellpads, pipelines).	
Excavation within the wetland, e.g., dugout, artificial pond, dead-en-	d ditch.		
Artificial drains or ditches in or near the wetland.			
Accelerated downcutting or channelization of an adjacent or interna	ıl channel (incised below the historical water table level).		
Logging within the wetland.			
Subsidence or compaction of the wetland's substrate as a result of			
Straightening, ditching, dredging, and/or lining of tributary channels.			
If any items were checked above, then for each row of the table belo To estimate effects, contrast the current condition with the condition		no measurable effect on the timing of water conditions in any part of	tine AA, then leave the "US" for the scores in the following row
	Severe (3 points)	Medium (2 points)	Mild (1 point)
Spatial extent of timing shift within the wetland:	>95% of wetland.	5-95% of wetland.	<5% of wetland.
When most of the timing shift began:	<3 yrs ago.	3-9 yrs ago.	10-100 yrs ago.
Score the following 2 rows only if the altered inputs began within pas	st 10 years, and only for the part of the wetland that experiences the	nose.	
Input timing now vs. previously:	Shift of weeks.	Shift of days.	Shift of hours or minutes.
Flashiness or muting:	Became very flashy or controlled.	Intermediate.	Became mildly flashy or controlled.

Native Plant Habitat (PH)	6.63	Higher	5.66	Moderate	5.76	4.91
Public Use & Recognition (PU)			2.18	Lower		1.88
Wetland Sensitivity (Sens)			0.50	Lower		2.35
Wetland Ecological Condition (EC)			5.66	Moderate		7.50
Wetland Stressors (STR) (higher score means more stress)			2.62	Moderate		3.22
Summary Ratings for Grouped Functions:						
HYDROLOGIC Group (WS)	7.19	Higher	1.91	Lower	3.54	1.98
WATER QUALITY SUPPORT Group (max+avg/2 of SR, PR, NR, CS)	2.73	Lower	8.90	Higher	6.26	8.38
AQUATIC SUPPORT Group (max+avg/2 of SFS, INV, OE, WC)	6.15	Higher	8.15	Higher	4.88	5.01
AQUATIC HABITAT Group (max+avg/2 of FA, FR, AM, WBF, WBN)	6.68	Higher	5.01	Moderate	5.76	4.75
TRANSITION HABITAT Group (max+avg/2 of SBM, PH, POL)	9.09	Higher	4.61	Moderate	7.51	4.15
WETLAND CONDITION (EC)			5.66	Moderate		7.50
WETLAND RISK (average of Sensitivity & Stressors)			1.56	Lower		2.79
	NOTE: A scor	e of 0 does not	mean the func	tion or benefit i	s absent from t	ne wetland. It

NOTE: A score of 0 does not mean the function or benefit is absent from the wetland. It means only that this wetland has a capacity that is equal or less than the lowest-scoring one, for that function or benefit, from among the 98 NB calibration wetlands that were assessed previously.

Cover Page: Basic Description of Assessment	WESP-AC version 2
Site Name:	Burchill Wind Energy Project - MC-Trib1B-W-01
Investigator Name:	Derrick Mitchell
Date of Field Assessment:	11 October 2019
Nearest Town:	Lorneville (west Saint John), New Brunswick
Latitude (decimal degrees):	
Longitude (decimal degrees):	-66.187355
Is a map based on a formal on-site wetland delineation available?	Yes
Approximate size of the Assessment Area (AA, in hectares):	0.5
AA as percent of entire wetland (approx.). Attach sketch map if AA is smaller than the entire contiguous wetland.	10
What percent (approx.) of the wetland were you able to visit?	10
What percent (approx.) of the AA were you able to visit?	
Were you able to ask the site owner/manager about any of the questions?	
Indicate here if you intentionally surveyed for rare plants, calciphile plants, or rare animals	
Have you attended a WESP-AC training session? If so, indicate approximate month & year	
How many wetlands have you assessed previously using WESP-AC? (approx.)	
Comments about the site or this WESP-AC assessment (attach extra page if desired):	

Form OF (Office). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Conduct an assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answering many of the questions below will equire using these online map viewers:

Google Earth Pro: https://www.google.com/earth/download/gep/agree.html

GeoNB: http://www.snb.ca/geonb1/ and http://www.snb.ca/geonb1/e/apps/apps-E.asp

Geons: http://www.sno.ca/geonol/ and http://www.sno.ca/geonol/e-apps/apps-e-asp
For most wetlands, completing this office data form will require 1-2 hours. For a list of functions to which each question pertains, see bracketed abbreviations in the Definitions/Explanations column. For detailed descriptions of each
WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus
Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding
Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity,

	Indicators	Condition Choices	Data	Definitions/Explanations
F1	Province	Mark the province in which the AA is located by changing the 0 in the column next to it to a "1". Mark only one.		This determines to which province's calibration wetlands the raw score of any wetland is normalise
		New Brunswick	1	In the function and benefits models, it also triggers the automatic exclusion of indicators for which spatial data exists in a particular province.
		Nova Scotia	0	spanial data oxists in a particular province.
		Prince Edward Island	0	
		Newfoundland-Labrador	0	
2	Ponded Area Within 1 km.	The area of surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) within 1 km is:		"Adjacent" means not separated from the AA by a wide expanse (>50 m) of upland (including roa >50 m wide). Include ponded areas likely to be hidden by wetland vegetation. If surface water
		<0.01 hectare (about 10 m x 10 m).	1	extends beyond 1 km, include only the part within 1 km. Do not include tidal areas. Measure the a from aerial imagery using Google Earth Pro (click on Ruler icon in toolbar, then Polygon in pop-up
		0.01 - 0.1 hectare.	0	menu). With the GeoNB viewer, enable the Wetlands layer, then measure with the Draw & Measure
		0.1 - 1 hectare.	0	tool after specifying Aerial as the Basemap. However, do not rely entirely on wetland boundaries
		1 to 10 hectares.	0	shown in online wetlands layers. [PH, SBM, WBN]
		10 to 100 hectares.	0	
3	Ponded Water & Wetland Within 1 km.	>100 hectares. The area of wetlands and surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) with 1 km is:	0 n	See definition of adjacent in OF2. If the AA's wetland vegetation extends beyond 1 km, include or the part within 1 km. "Ponded" means not flowing in rivers or streams. [Sens, WBF]
	Welland Willin T Kin.	<u> </u>	0	are part within 1 km. 1 onded means not nowing in the cis of streams. (Sens, WB) j
		<0.01 hectare (about 10 m x 10 m).	0	-
		0.01 - 0.1 hectare.	0	-
		0.1 - 1 hectare. 1 to 10 hectares.	0	-
		10 to 100 hectares.	0	-
		>100 hectares.	1	
1	Size of Largest Nearby	The largest vegetated patch or corridor that includes the AA's vegetation plus aladjacent upland vegetation that is not lawn, row crops,		See definition of adjacent in OF2. Use Google Earth Pro's polygon ruler (as described above).
	Vegetated Tract or	heavily grazed lands, conifer plantation is:		Exclude conifer plantations only if it is obvious that trees were planted in rows. [AM, PH, SBM, Se
	Corridor	<0.01 hectare (about 10 m x 10 m).	0	
		0.01 - 0.1 hectare.	0	1
		0.1 - 1 hectare.	0	
		1 to 10 hectares.	0	1
		10 to 100 hectares.	0	1
		100 to 1000 hectares.	- 1	
		>1000 hectares. [This is nearly always the answer in relatively undeveloped landscapes]	0	
5	Distance to Large Vegetated Tract	The minimum distance from the edge of the AA to the edge of the closest vegetated land (but excluding row crops, lawn, conifer plantation) larger than 375 hectares (about 2 km on a side), is:		To measure distance, use Google Earth Pro (Ruler > Line tool). Or use Draw & Measure tool at GeoNB. The 375-ha criterion is from the Fundy Model Forest Project. [AM, PH, POL, SBM, Sen:
		450 m, and not separated from the 375-ha vegetated area by any width opaved roads, streiches of open water, row crops, bare ground, lawn, or impervious surface. Or the AA itself contains >375 ha of vegetation. [This is often the answer in relatively undeveloped landscap.	1	
		<50 m, but completely separated from the 375-ha vegetated area by those features, and AA does not contain >375 ha of vegetation.	0	
		50-500 m, and not separated.	0	
		50-500 m, but separated by those features.	0	
		0.5 - 5 km, and not separated.	0	
		0.5 - 5 km, but separated by those features.	0	
		None of the above (the closest patches or corridors which are that large are >5 km away).	0

		10-40 km.	0	1
OF16	Upland Edge Contact	Select one:	Ů	[NR, SBM, Sens]
		The AA has no upland edge (or upland is <1% of perimeter). The AA is entirely surrounded by (& contiguous with) other wetlands or water	. 0	
		1-25% of the AA's perimeter abuts upland (including filled areas). The rest adjoins other wellands or water that is mostly wider than the AA	0	
		25-50% of the AA's perimeter abuts upland. The rest adjoins other wetlands or water that is mostly wider than the AA. 50-75% of the AA's perimeter abuts upland. The rest adjoins other wetlands or water that is mostly wider than the AA.	0	
		More than 75% of the AA's perimeter abuts upland. Any remainder adjoins other wetlands or water that is mostly wider than the AA.This	0	
		will be true for most assessments done with WESP-AC.		
OF17	Flood Damage from Non- tidal Waters	Within 5 km downstream or downslope of the AA (select first true choice):		In the GeoNB map viewer: click on "More" in upper right, then "Flood Information". Expand the meni under it by clicking on the arrow to its left and the slider to its right. Uncheck the first (Limits of Data)
	tidai Walci S	Maps show Flood Zone or Flood Risk areas and there appears to be infrastructure vulnerable to river flooding not caused by tidal storm surges. Maps show Flood Zone or Flood Risk areas, but infrastructure is absent or is not vulnerable to floods from a non-lidal river. In some cases	0	box. Where available, LIDAR imagery can provide finer elevational resolution useful for flood modeling. [WSv]
		evees, upriver dams, or other measures may partly limit damage or risk from smaller events. Maps do not show Flood Zone or Flood Risk areas for no such mapping has been done locally) and there appears to be infrastructure	0	
		vulnerable to river flooding unrelated to tidal storm surges. Maps do not show Flood Zone or Flood Risk areas (or no such mapping has been done locally) and there i no infrastructure vulnerable	1	
OF18	Relative Elevation in Watershed	o river flooding unrelated to lidal storm surges. In Google Earth, enable the Terrain layer (lower left menu) and open the NB_Watersheds KMZ file that accompanies this calculator. Then determine the AXS approximate elevation (bottom right, NOT the "eye alt"). Then move cursor around to determine the watershed's		[FA, NR, Sens, SFSv, WCv, WSv]
OF19	Water Quality Sensitive	maximum and minimum elevation. Divide the AM's elevation by the (max-min). In Google Earth, open the KMZ file NB, Watershed Protected Area which accompanies this calculator. The AA is within such an area.	0.60	If an ACCDC report is available for this AA, it also may contain such information. [NRv]
OF20	Watershed or Area Degraded Water	Enter 1= yes, 0= no. Sampling indicates a problem with concentrations ofmetals, hydrocarbons, nutrients, or other substances (excluding bacteria, acidic		May use existing data, or sample those waters as part of this wetland assessment. "Harmful" should
20	Upstream	water, high temperatures) being present at levels harmful to aquatic life or humans, and:	0	be evaluated with regard to current federal or provincial water quality standards. [AM, FA, FR, NRv, PRv, SRv, STR, WBF, WBN]
		The condition is present within the AA. The condition is present in waters within 1 km that flowinto the AA, but has not been documented in the AA itself.	0	1
		Sampling during both low water periods and times with high runoff (storms, snowmelt) indicates no problems in either the AA or inflowing waters.	0	1
		Data are insufficient (no or inadequate sampling within 1 km, or condition exists only at >1 km upstream)This is the situation for nearly all wetlands in this region.	1	
OF21	Degraded Water	The problem described above is downslope from the AA, and:		May use existing data, or monitor waters as part of this wetland assessment. [NRv, PRv, SRv]
	Downstream	The condition is present within 1 km downslope and connected to the AA by a channel.	0	1
		The condition is present within 5 km downslope and connected to the AA by a channel, or within 1 km but not connected to the AA by a channel. Sampling during both low water periods and times with high runoff (storms, snowmett) indicates no problems in either the AA or inflowing	0	
		waters. Data are insufficient (no or inadequate sampling within 1 km, or condition exists only at >1 km upstream)This is the situation for nearly	0	
		all wetlands in this region.		
OF22	Wetland as a % of Its Contributing Area (Catchment)	From a topographic map and field observations, estimate the approximate boundaries of the catchment (CA) of the entire wetland of which the AI may be only a part. The adjust hose boundaries if necessary based on your field observations of the surrounding terrain, and/or tusing procedures described in the Manual. Divide the area of the wetland (not just the AA) by the approximate area of its catchment excluding the area of the wetland itself. When doing the calculation, if ponded water is adjacent to the wetland, include that in the wetland area. The result is:	Y	Topographic maps may be viewed online at the National Atlas of Canada (Toporama): http://atlas.gc.ca/loporamalen/index.html [NR, PR, Sens, SR, WS]
		< 0.01, or catchment size unknown due to stormwater pipes that collect water from an indeterminate area. 0.01 to 0.1.	0]
		0.1 to 1.	1	1
		>1 (welland is larger than its catchment (e.g., welland with flat surrounding terrain and no inlet, or is entirely isolated by dikes, or is a raise bog).	0	
OF23	Unvegetated Surface in the Contributing Area	The proportion of the AA's contributing area (measured to no more than 1000 m upslope) that is comprised of buildings, roads, parking lot other pavement, exposed bedrock, landslides, and other mostly-bare surface is about: nrsc.	1	[FA, INV, NRv, PRv, SRv, STR, WCv, WSv]

---	-----------------------------

Form F (Field). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Walk for no less than 10 minutes from the wetland edge towards its core, in the part of the AA that is proposed for alteration. If no alteration is proposed, walk in a portion that appears to be most representative of the wetland overall. Walk only where it is safe and legal to do so. Conduct the assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answer these questions primarily based on your onsite observations and interpretations. Do not write in shaded parts of this data form. Answering some questions accurately may require conferring with the landowner or other knowledgable persons and/or reviewing aerial imagery. For most wetlands, completing this field data form will require 1-2 hours on a site. For a list of functions to which each question pertains, see the accompanying Interpretations form. For detailed descriptions of each WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage & Delay, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity, STR= Stressors.

#	Indicators	Condition Choices	Data	Definitions/Explanations
1	Wetland Type	Follow the key below and mark the ONE row that best describes MOST of the vegetated part of the AA:		Ericaceous shrubs are ones in the heather family (Ericaceae). Most have leathery evergreen leaves. They include rhododendron, azalea, swamp laurel, leatherleaf, Labrador tea, and others. Most require
		A. Moss and/or lichen cover more than 25% of the ground. Often dominated by ericaceous shrubs (e.g., Labrador tea) or other acid-tolerant plants (e.g., bog caraberry, pilchre plant, sudew, bor cribtis). Substrate is mostly undecomposed peat. Choose between A1 and A2 and mark the choice with a 1 in their adjoining column. Otherwise go to B below.		acidic soil. Although not in the family Ericaceae, sweetgale (<i>Myrica gale</i>) should be counted also. [AM, CS, FA, FR, INV, NR, OE, PH, Sens, SFS, WBF, WBN]
		A1. Surface water is usually absent or, if present, pH is typically <4.5 and conductivity is usually <100 µS/cm (<64 ppm TDS). Trees are absent or nearly so. Sedge cover usually sparse or absent but cottongrass and/or lichen cover may be extensive, as well as cloudberry, lingonberry, sheep laurel, and a sedge (Carex rarillora). Wetland surface and surrounding landscape are seldom sloping and wetland often is domed (convex). Inlet and outlet channels are usually absent. If known, pH of peat is <4.0.	0	
		A2. Not A1. Surface water, if present, has pH typically >4.5 and conductivity is usually >100 µS/cm (>64 ppm TDS). Sedge cover is usually extensive, and/or tree and tall shrub cover is extensive. Sometimes at toe of slope or edge of water body. An exit channel is usually present. Wetter than A1 and peat depth may be shallower (<2 m).	1	
		B. Moss and/or lichen cover less than 25% of the ground. Soil is mineral or decomposed organic (muck). Choose between B1 and B2 and mark the choice with a 1 in their adjoining column:		
		B1. Trees and shrubs taller than 1 m comprise more than 25% of the vegetated cover. Surface water is mostly absent or inundates the vegetation only seasonally (e.g., vernal pools or floodplain).	0	
		B2. Not B1. Tree & tall shrubs comprise less than than 25% of the vegetated cover. Vegetation is mostly herbaceous, e.g., cattail, bulrush, burreed, pond lily, horsetail. Surface water may be extensive and fluctuates seasonally, being either persistent or drying up partly or entirely.	0	
1A sh	ould also include part of	the AA should include all persistent waters in ponds smaller than 8 hectares (-283 m on a side) that are adjacent to the AA. The the water area of adjacent ponded water larger than 8 ha and adjacent rivers wider than 20 m. Specifically, the AA should facent to wetland vegetation and equal in width to the average width of that vegetated zone. Throughout this data form,		
tescn	ibed features along their i	usly with abutting, adjoining, bordering, contiguous and means no upland (manmade or natural) completely separates the directly shared edge. Features joined only by a channel are not necessarily considered to be adjacent a large portion of their res do not have to be hydrologically connected in order to be considered adjacent.		
2	Wetland Types - Adjoining or Subordinate	If the AA is smaller than 1 ha, mark all other types that occupy more than 1% of the vegetated AA. If the AA is larger than 1 ha, mark all other types which are within or adjacent to the AA and occupy more than 1 ha, as visible from the AA or as interpreted from aerial imagery. Do not mark again the type marked in F1.		1 hectare is 10,000 sq. m or about 2.5 acres. It could have dimensions of 100 m by 100 m, 1000 m by 10 m, or similar. [AM, INV, SBM, WBF]
		A1.	0	
		A2. B1.	0	
		B2.	0	
3	Woody Height & Form Diversity	Following EACH row below, indicate with a number code the percentage of the living vegetation in the AA which is occupied by that feature (6 if >95%, 5 if 75-95%, 4 if 50-75%, 3 if 25-50%, 2 if 5-25%, 1 if <5%, 0 if none). If the vegetated part of the AA is largely herbaceous (non-woody) vegetation, these percentages should not sum to 100%.		Deciduous shrubs in this region usually include buttonbush, Labrador tea, bayberry (Moreilla), huckleberry, cranberry, cloudberry, sweetgale, alder, willow, birch, ash, dogwood, and a few others. If you assigned a code of 3 or higher to any of the first four choices and the ground cover beneath the threes/shrubs is <25% moss, then question F1 might be "B1". (CS, NV, NR, PH, POL, SBM, Sens)
		coniferous trees (may include tamarack) taller than 3 m. deciduous trees taller than 3 m.	3	incoming and the second
		coniferous or ericaceous shrubs or trees 1-3 m tall not directly below the canopy of trees.	2	
		deciduous shrubs or trees 1-3 m tall not directly below the canopy of trees.	2	
		coniferous or ericaceous shrubs <1 m tall not directly below the canopy of taller vegetation. deciduous shrubs or trees <1 m tall (e.g., deciduous seedlings) not directly below the canopy of taller vegetation.	4	
<u>Vote</u> :		F3 was marked 2 or greater , SKIP to F9 (N fixers).		
4	Dominance of Most Abundant Shrub	Determine which two woody plant species comprise the greatest portion of the low (<3 m) woody cover . Then choose one:		[PH, POL, SBM, Sens]
	Species	those species together comprise > 50% of such cover. those species together do not comprise > 50% of such cover.	0	
5	Woody Diameter Classes	Mark ALL the types that comprise >5% of the woody canopy cover in the AA or >5% of the wooded areas (if any) along its upland edge (perimeter). The edge should include only the trees whose canopies extend into the AA.		Estimate the diameters at chest height. If small-diameter trees are overtopped (shaded) by larger ones, visualise a "subcanopy" at the average height of the smaller-dbh trees, to serve as a basis for the
		coniferous, 1-9 cm diameter and >1 m tall. broad-leaved deciduous 1-9 cm diameter and >1 m tall.	1	minimum 5% canopy requirement in this question. The trees and shrubs need not be wetland species [AM, CS, POL, SBM, Sens, WBN]
		uroad-leaved deciduous 1-9 cm diameter and > 1 m tail. coniferous, 10-19 cm diameter.	1	
		broad-leaved deciduous 10-19 cm diameter.	1	
		coniferous, 20-40 cm diameter. broad-leaved deciduous 20-40 cm diameter.	1	
		coniferous, >40 cm diameter.	0	
,	Heisel Class	broad-leaved deciduous >40 cm diameter.	0	TAMA INIV NID DIL COM Coord
0	Height Class Interspersion	Follow the key below and mark the ONE row that best describes MOST of the AA: A. Neither the vegetation taller than 1 m nor the vegetation shorter than that comprise >70% of the vegetated part of the AA. They each comprise 30-70%. Choose between A1 and A2 and mark the choice with a 1 in the adjoining column. Otherwise go to B below.		[AM, INV, NR, PH, SBM, Sens]
		A1. The two height classes are mostly scattered and intermixed throughout the AA.	0	
		A2. Not A1. The two height classes are mostly in separate zones or bands, or in proportionately large clumps. B. Either the vegetation shorter than 1 m comprises >70% of the vegetated part of the AA, or the vegetation taller than that does. One size	0	
		B. Either the vegetation shorter than 1 m comprises > 70% of the vegetated part of the AA, or the vegetation failer than that does. One size class might even be totally absent. Choose between B1 and B2 and mark the choice with a 1 in the adjoining column:		
		B1. The less prevalent height class is mostly scattered and intermixed within the prevalent one.	0	
		B2. Not B1. The less prevalent height class is mostly located apart from the prevalent one, in separate zones or clumps, or is completely		
7	Large Snags (Dead	B2. Not B1. The less prevalent height class is mostly located apart from the prevalent one, in separate zones or clumps, or is completely absent. The number of large snags (diameter >20 cm) in the AA plus adjacent upland area within 10 m of the wetland edge is:		
7	Large Snags (Dead Standing Trees)	absent. The number of large snags (diameter >20 cm) in the AA plus adjacent upland area within 10 m of the wetland edge is: None, or fewer than 8/ hectare which exceed this diameter.	0	Snags are dead standing trees that often (not always) lack bark and foliage. Include only ones that are at least 2 m tall. [POL, SBM, WBN]
7		absent. The number of large snags (diameter >20 cm) in the AA plus adjacent upland area within 10 m of the wetland edge is: None, or fewer than 8/ hectare which exceed this diameter. Several (>8/hectare) and a pond, lake, or slow-flowing water wider than 10 m is within 1 km.	0 0	
7		absent. The number of large snags (diameter >20 cm) in the AA plus adjacent upland area within 10 m of the wetland edge is: None, or fewer than 8/ hectare which exceed this diameter.		
7	Standing Trees)	absent. The number of large snags (diameter >20 cm) in the AA plus adjacent upland area within 10 m of the wetland edge is: None, or fewer than 8/ hectare which exceed this diameter. Several (>8/hectare) and a pond, lake, or slow-flowing water wider than 10 m is within 1 km. Several (>8/hectare) but above not true.		

FieldF form - Non-tidal Page 1 of 5

FO	N Fixers	The percentage of the AA's vegetated cover that contains nitrogen-fixing plants (e.g., alder, sweetgale, clover, lupine, alfalfa, other legumes)		Do not include N-fixing algae or lichens. [FA, FR, INV, NRv, OE, PH, SBM, Sens]
1 7	IN FIXEIS	is:		DO NOT INCIDIDE INVINING AIGAE OF INCIDENS. [F.A., F.K., INV., INV., O.E., F.H., SDIW, SENS]
		<1% or none.	0	
		1-25% of the vegetated cover, in the AA or along its water edge (whichever has more).	0	
		25-50% of the vegetated cover, in the AA or along its water edge (whichever has more). 50-75% of the vegetated cover, in the AA or along its water edge (whichever has more).	0	
		>75% of the vegetated cover, in the AA or along its water edge (whichever has more).	0	
F10	Sphagnum Moss	The cover of Sphagnum moss (or any moss that forms a dense cushion many centimeters thick), including the moss obscured by taller		Exclude moss growing on trees and rocks. [CS, PH]
	Extent	sedges and other plants rooted in it, is:		
		<5% of the vegetated part of the AA.	0	
		5-25% of the vegetated part of the AA.	1	
		25-50% of the vegetated part of the AA. 50-95% of the vegetated part of the AA.	0	
		>95% of the vegetated part of the AA.	0	
F11	% Bare Ground &	Consider the parts of the AA that lack surface water at the driest time of the growing season. Viewed from directly above the ground layer, the		Thatch is dead plant material (stems, leaves) resting on the ground surface. Bare ground that is
	Thatch	predominant condition in those areas at that time is:		present under a tree or shrub canopy should be counted. Boulders count as bare ground. Wetlands
		Little or no (<5%) bare ground is visible between erect stems or under canopy anywhere in the vegetated AA Ground is extensively blanketed by dense thatch, moss, lichens, graminoids with great stem densities, or plants with ground-hugging foliage.	1	with mineral soils and that are heavily shaded or are dominated by annual plant species tend to have more extensive areas that are bare during the early growing season. [AM, EC, INV, NR, OE, POL, PR, SBM, Sens]
		Slightly bare ground (5-20% bare between plants) is visible in places, but those areas comprise less than 5% of the unflooded parts of the AA.	0	
		Much bare ground (20-50% bare between plants) is visible in places, and those areas comprise more than 5% of the unflooded parts of the AA.	0	
		Other conditions.	0	
F12	Ground Irregularity	Not applicable. Surface water (either open or obscured by emergent plants) covers all of the AA all the time. Imagine the AA without any living vegetation. Excluding the portion of the AA that is always under water, the number of hummocks, small pils,	0	The depressions may be of human or natural origin. [AM, EC, INV, NR, PH, POL, PR, SBM, SR, WS]
1 12	Ground megulatily	raised mounds, animal burrows, ruts, guilles, natural levees, microdepressions, and other areas of peat or mineral soil that are raised or depressed >10 cm compared to most of the area within a few meters surrounding them is:		The deposition may be a maintain an additional plant, Ed. 111, 111, 111, 111, 111, 111, 111, 11
		Few or none (minimal microtopography; <1% of the land has such features, or entire AA is always water-covered).	1	
		Intermediate.	0	
F12	Unland Indusis	Several (extensive micro-topography). Mithin the AA inclusions of unland are:	0	[AM, NR, SBM]
F13	Upland Inclusions	Within the AA, inclusions of upland are:		[ми, ик, эрии]
		Few or none.	1	
		Intermediate (1 - 10% of vegetated part of the AA). Many (e.g., wetland-upland "mosaic", >10% of the vegetated AA).	0	
F14	Soil Texture	In parts of the AA that lack persistent water, the texture of soil in the uppermost layer is mostly: [To determine this, use a trowel to check in at	U	[CS, NR, OE, PH, PR, Sens, SFS, WS]
	Soil Texture	least 3 widely spaced locations, and use the soil texture key (in Appendix A of the Manual).]		[,,,,],]
		Loamy: soils that may contain a little fine grit and do not make a "ribbon" longer than 2 cm when moistened, rolled, squeezed, and extended	0	
		between thumb and forefinger. Finest installed settled a site fact make a ribben langer than 2 am when maintained ralled sequenced and extended between thumb and	1	
		Fines: includes silt, clay, silt, soils that make a ribbon longer than 2 cm when moistened, rolled, squeezed, and extended between thumb and forefinger.	1	
		Deep Peat, to 40 cm depth or greater.	0	
		Shallow Peat or organic <40 cm deep.	0	
		Coarse: includes sand, loamy sand, gravel, cobble, soils that do not make a ribbon when moistened, rolled, squeezed, and extended between thumb and forefinger.	0	
F15	Shorebird Feeding	During any 2 consecutive weeks of the growing season, the extent of mudflats, bare unshaded saturated areas not covered by thatch, and		This addresses needs of many but not all migratory sandpipers, plovers, and related species. [WBF]
	Habitats	unshaded waters shallower than 6 cm is: [Include also any area that is adjacent to the AA.]		
		None, or <100 sq. m.	1	
		100-1000 sq. m.	0	
		1000 – 10,000 sq. m. >10,000 sq. m.	0	
F16	Herbaceous % of	In aerial ("ducks eye") view, the maximum annual cover of herbaceous vegetation (all non-woody plants except moss) is:		[AM, WBF, WBN]
	Vegetated Wetland	<5% of the vegetated part of the AA or <0.01 hectare (whichever is less). Mark "1" here and SKIP to F20 (Invasive Plant Cover).	0	
		5-25% of the vegetated part of the AA.	0	
		25-50% of the vegetated part of the AA.	0	
		50-95% of the vegetated part of the AA.	1	
E17	F-+ 0	>95% of the vegetated part of the AA.	0	
F17	Forb Cover	Within parts of the AA having herbaceous cover (excluding SAV), the areal cover of forbs reaches an annual maximum of:		Forbs are flowering plants. Do not include grasses, sedges, cattail, other graminoids, ferns, horsetails, or others that lack showy flowers. [POL]
		<5% of the herbaceous part of the AA.	0	
		5-25% of the herbaceous part of the AA. 25-50% of the herbaceous part of the AA.	0

		30 - 49 m.	0	
		50 - 100 m. > 100 m. or open water is absent at that time.	0	
F35	Flat Shoreline Extent	During most of the part of the growing season when water is present, the percentage of the AA's water edge length that is nearly flat (a slope less than about 5% measured within 5 m landward of the water) is:	Ü	If several isolated pools are present in early summer, estimate the percent of their collective shorelines that has such a gentle slope. [SR, WBN]
		<1% of the water edge.	0	
		1-25% of the water edge. 25-50% of the water edge.	0	
		25-50% of the water edge. 50-75% of the water edge.	0	
		>75% of the water edge.	0	
F36	Robust Emergents	The percentage of the emergent vegetation cover in the AA that is cattail (<i>Typha</i> spp.), common reed (<i>Phragmites</i>), or tall (>1m) bulrush is:		Emergent vegetation is herbaceous plants whose stems are partly above and partly below the water surface during most of the time water is present. [WBN]
		<1% of the emergent vegetation, or emergent vegetation is absent. SKIP to F38.	0	
		1-25% of the emergent vegetation. 25-75% of the emergent vegetation.	0	
		>75%, of the emergent vegetation.	0	
		. G. Caranter		

FieldF form - Non-tidal Page 3 of 5

F37	Interspersion of	During most of the part of the growing season when water is present, the spatial pattern of emergent vegetation within the water is mostly:		[AM, FA, FR, INV, NR, OE, PH, PR, SBM, SR, WBF, WBN]
	Emergents & Open			
	Water	Scattered. More than 30% of such vegetation forms small islands or corridors surrounded by water. Intermediate.	0	
		Clumped. More than 70% of such vegetation is in bands along the wetland perimeter or is clumped at one or a few sides of the surface water	0	
F38	Persistent Deepwater	area. If the deepest patch of surface water (flowing or ponded) in or directly adjacent to the AA is mostly deeper than 0.5 m for >2 weeks during the	0	
	Area	growing season, enter "1" and continue. If not, enter "0" and SKIP to F42.(Connection).		
F39	Non-vegetated Aquatic Cover	During most of the growing season and in waters deeper than 0.5 m, the cover for fish, aquatic invertebrates, and/or amphibians that is provided NOT by living vegetation, but by accumulations of dead wood and undercut banks is:		For this question, consider only the wood that is at or above the water surface. Estimates of underwater wood based only on observations from terrestrial viewpoints are unreliable so should not be attempted.
		Little or none. Intermediate.	0	[AM, FA, FR, INV]
		Extensive.	0	
F40	Isolated Island	The AA contains (or is part of) an island or beaver lodge within a lake, pond, or river, and is isolated from the shore by water depths > 1 m on all sides during an average June. The island may be solid, or it may be a floating vegetation mat that is sufficiently large and dense to support a waterbird nest.	n O	[WBN]
F41	Floating Algae & Duckweed	Al some time of the year, mats of algae and/or duckweed are likely to cover >50% of the AA's otherwise-unshaded water surface, or blanket >50% of the underwater substrate. If true, enter "1" in next column. If untrue or uncertain, enter "0".	0	[EC, PR, WBF]
F42	Channel Connection & Outflow Duration	The most persistent surface water connection (outlet channel or pipe, dilitch, or overbank water exchange) between the AA and a downslope stream network is: [Note: If the AA represents only part of a wetland, answer this according to whichever is the least permanent surface connection: the one between the AA and the rest of the wetland, or the surface connection between the wetland and the downslope stream network.] Persistent (surface water flows out for >9 months/year).	1	Consider the connection regardless of whether the surface water is frozen. The "downslope stream network" could consist of ditches, rivers, ponds, or lakes which eventually connect to the ocean. If this cannot be determined while visiting the AA, consult lopographic maps perhaps by viewing these online with Toporama (http://atlas.nrcan.gc.ca/loporama/en/index.html) [CS, FA, FR, NR, OE, PR, Sens, SFS SR, WCv, WS]
		Seasonal (surface water flows out for 14 days to 9 months/year, not necessarily consecutive).	0	
		Temporary (surface water flows out for <14 days, not necessarily consecutive). None but maps show a stream network downslope from the AA and within a distance that is less than the AA's length. SKIP to F47 (pH	0	
		Measurement).		
		No surface water flows out of the wetland except possibly during extreme events (<once (ph="" 10="" a="" an="" dilch,="" f47="" flows="" into="" lacks="" lake="" measurement).<="" only="" or="" or,="" outlet.="" per="" skip="" td="" that="" to="" water="" wetland,="" years).=""><td>0</td><td></td></once>	0	
F43	Outflow Confinement	During major runoff events, in the places where surface water exits the AA or connected waters nearby, the water:		"Major runoff events" would include biennial high water caused by storms and/or rapid snowmelt. [CS, NR, OE, PR, Sens, SR, STR, WS]
		Mostly passes through a pipe, culvert, narrowly breached dike, berm, beaver dam, or other partial obstruction (other than natural topography) that does not appear to drain the wetland artificially during most of the growing season.	0	MK, OL, FR, Sells, SK, STK, WSJ
		Leaves through natural exits (channels or diffuse outflow), not mainly through artificial or temporary features.	1	
		Is exported more quickly than usual due to ditches or pipes within the AA or connected to its outlet, or within 10 m of the AA's edge, which drain the wetland artificially, or water is pumped out of the AA.	0	
F44	Tributary Channel	At least once annually, surface water from a tributary channel that is >100 m long moves into the AA. Or, surface water from a larger permanent water body adjacent to the AA spills into the AA. If it enters only via a pipe, that pipe must be fed by a mapped stream or lake further upslope. If no, SKIP to F47 (pH Measurement).	1	If inlet tributaries cannot be searched for due to inaccessibility of part of the AA, follow suggestions in F42 above. [NRv, PH, PRv, SRv]
F45	Input Water Temperature	Based on lack of shade, water source characteristics, or actual temperature measurements, the inflow is likely to be warmer than surface water in the AA during part of most years. Enter 1= yes, 0= no.	1	[WCv]
	Throughflow Resistance	During its travel through the AA at the time of peak annual flow, water arriving in channels: [select only the ONE encountered by most of the		[FA, FR, INV, NR, OE, PR, SR, WS]
		incoming water). Does not bump into many plant stems as it travels through the AA. Nearly all the water continues to travel in unvegetated (often incised)	0	
		channels that have minimal contact with wetland vegetation, or through a zone of open water such as an instream pond or lake.		
		Bumps into herbaceous vegetation but mostly remains in fairly straight channels. Bumps into herbaceous vegetation and mostly spreads throughout, or is in widely meandering, multi-branched, or braided channels.	0	
		bumps into nerbaceous vegeration and mostly spreads unoughout, or is in widely meandering, multi-branched, or brance diffamels.	U	
		Bumps into tree trunks and/or shrub stems but mostly remains in fairly straight channels. Bumps into tree trunks and/or shrub stems and follows a fairly indirect path from entrance to exit (meandering, multi-branched, or braided).	0	
F47	pH Measurement	The pH in most of the AA's surface water:		Preferably, measure this in larger areas of ponded surface water within the AA, or in streams that have passed through (not along) most of the AA. Unless surface water is completely absent, do not dig holes
		Was measured, and is: [enter the reading in the column to the right.]		or make depressions in peat in order to provide water for this measurement. Avoid measuring near
		Was not measured but surface water is present and is darkly tea-coloured. Or if no surface water, then mosses and plants that indicate peatland (e.g., Labrador tea) are prevalent. Enter "1". Neither of above. Enter "1".	0	roads or in puddles formed only by recent rain. [AM, FA, FR, NR, WBF, PH, PR, Sens, WBF, WBN]
F48	TDS and/or Conductivity	The TDS (total dissolved solids) or conductivity off the AA's surface water is: (select the first true row with information):	1	See above for measurement guidance. [FR, INV, NRv, PH, PRv, Sens]
		TDS is: [Enter the reading in ppm or mg/L in the column to the right, if measured, or answer next row.]		
		Conductivity is [Enter the reading in µSlcm in the column to the right.] Was not measured, but plants that indicate saline conditions cover much of the vegetated AA. Enter "1".	0	
		Neither of above	1	
F49	Beaver Probability	Use of the AA by beaver during the past 5 years is (select most applicable ONE):		[FA, FR, PH, SBM, Sens, WBF, WBN]
		Evident from direct observation or presence of gnawed limbs, dams, tracks, dens, lodges, or extensive stands of water-killed trees (snags).	0	
		Likely based on known occurrence in the region and proximity to suitable habitat, which may include: (a) a persistent freshwater welland, pond, or lake, or a perennial low or mid-gradient (<10%) channel, and (b) a corridor or multiple stands of hardwood trees and shrubs in vegetated areas near surface water.	1	
EEO	Croundwater C:	Unlikely because site characteristics above are deficient, and/or this is a settled area or other area where beaver are routinely removed.	0	Adhere to those critician strictly, do not we reconstitutionant!
	Groundwater Strength of Evidence	Select first applicable choice: Springs are known to be present within the AA, or if groundwater levels have been monitored, that has demonstrated that groundwater primarily discharges to the wetland for longer periods during the year than periods when the wetland recharges the groundwater.	0	Adhere to these criteria strictly – do not use personal judgment based on fen conditions, pH, or other evidence. Consult tographic maps to delect breaks in slope described here. Rust deposits associated with groundwater seeps may be most noticeable as orange discoloration in ice formations along streams during early writer. [AM, CS, FA, FR, INV, NR, OE, PH, PRV, SFS, WC, WS]
		Most of the AA has a slope of >5%, or is very close to the base of a natural slope longer than 100 and much steeper than the slope of the AA AND the pH of surface water, if known, is >5.5.	, 0	
001		Neither of above is true, although some groundwater may discharge to or flow through the AA. Or groundwater influx is unknown.	1	
F51	Internal Gradient	The gradient along most of the flow path within the AA is:		This is not the same as the shoreline slope. It is the elevational difference between the AA's inlet and outlet, divided by the flow-distance between them and converted to percent. If available, use a
		<2% or the AA has no surface water outlet (not even seasonally). 2-5%.	0	clinometer to measure this. Free clinometer apps can be downloaded to smartphones. If the wetland is large (longer than -1 km), this may be estimated using Google Earth to determine the minimum and
		6-10%.	0	maximum elevation within the AA, then dividing by length and multiplying by 100. [CS, NR, OE, PR,
Note fo	r the next three questi	>10%. ons: If the AA lacks an upland edge, evaluate based on the AA's entire perimeter, and moving outward into whatever areas are	0	SR, WBF, WBN, WS]

In the last column, place a check mark next to any item that is likely more temporal homogeneity of flow or water levels) or more flashy (l			nuted (smaller or less frequent peaks spread over longer time:	
Stormwater from impervious surfaces that drains directly to the wet	and.			
Water subsidies from wastewater effluent, septic system leakage, s	now storage areas, or irrigation.			
Regular removal of surface or groundwater for irrigation or other co	nsumptive use.			
Flow regulation in tributaries or water level regulation in adjoining w	ater body, or other control structure at water entry points that regu	alates inflow to the wetland.		
A dam, dike, levee, weir, berm, or fill within or downgradient from	the wetland that interferes with surface or subsurface flow in/ou	t of the AA (e.g., road fill, wellpads, pipelines).		
Excavation within the wetland, e.g., dugout, artificial pond, dead-en	d ditch.			
Artificial drains or ditches in or near the wetland.				L
Accelerated downcutting or channelization of an adjacent or internal	I channel (incised below the historical water table level).			
Logging within the wetland.	machinery livestack fire drainers or off read vehicles			H
Subsidence or compaction of the wetland's substrate as a result of Straightening, ditching, dredging, and/or lining of tributary channels	*			-
If any items were checked above, then for each row of the table belo		no measurable effect on the timing of water conditions in any part of	f the AA then leave the "O's" for the scores in the following row	c
To estimate effects, contrast the current condition with the condition		to measurable eneet on the timing of water continions in any part of	are full, their leave the 03 for the secres in the following for	
	Severe (3 points)	Medium (2 points)	Mild (1 point)	
Spatial extent of timing shift within the wetland:	>95% of wetland.	5-95% of wetland.	<5% of wetland.	
When most of the timing shift began:	<3 yrs ago.	3-9 yrs ago.	10-100 yrs ago.	L
Score the following 2 rows only if the altered inputs began within pas			919.41	
Input timing now vs. previously:	Shift of weeks.	Shift of days.	Shift of hours or minutes.	-
Flashiness or muting:	Became very flashy or controlled.	Intermediate.	Became mildly flashy or controlled.

Waterbird Nesting Habitat (WBN)	4.86	Moderate	2.50	Moderate	4.15	2.50
Songbird, Raptor, & Mammal Habitat (SBM)	9.39	Higher	2.50	Lower	7.79	2.50
Pollinator Habitat (POL)	10.00	Higher	0.00	Lower	8.19	0.00
Native Plant Habitat (PH)	8.15	Higher	6.14	Moderate	6.37	5.33
Public Use & Recognition (PU)			2.26	Lower		1.94
Wetland Sensitivity (Sens)			4.00	Moderate		3.40
Wetland Ecological Condition (EC)			7.11	Higher		8.33
Wetland Stressors (STR) (higher score means more stress)			0.22	Lower		2.34
Summary Ratings for Grouped Functions:						
HYDROLOGIC Group (WS)	6.67	Higher	1.43	Lower	2.72	1.50
WATER QUALITY SUPPORT Group (max+avg/2 of SR, PR, NR, CS)	2.34	Lower	8.62	Higher	5.43	8.18
AQUATIC SUPPORT Group (max+avg/2 of SFS, INV, OE, WC)	7.92	Higher	6.35	Higher	6.13	3.89
AQUATIC HABITAT Group (max+avg/2 of FA, FR, AM, WBF, WBN)	4.46	Moderate	3.35	Moderate	4.41	3.48
TRANSITION HABITAT Group (max+avg/2 of SBM, PH, POL)	9.59	Higher	4.51	Moderate	7.82	3.97
WETLAND CONDITION (EC)			7.11	Higher		8.33
WETLAND RISK (average of Sensitivity & Stressors)			2.11	Lower		2.87
	NOTE: A soor	a of 0 does not	mean the func	tion or honofit i	e abcent from t	he wetland It

NOTE: A score of 0 does not mean the function or benefit is absent from the wetland. It means only that this wetland has a capacity that is equal or less than the lowest-scoring one, for that function or benefit, from among the 98 NB calibration wetlands that were assessed previously.

Cover Page: Basic Description of Assessment	WESP-AC version 2
Site Name:	Burchill Wind Energy Project - MC-Trib1C-W-03
Investigator Name:	Derrick Mitchell
Date of Field Assessment:	9 October 2019
Nearest Town:	Lorneville (west Saint John), New Brunswick
Latitude (decimal degrees):	45.1904
Longitude (decimal degrees):	-66.184379
Is a map based on a formal on-site wetland delineation available?	Yes
Approximate size of the Assessment Area (AA, in hectares):	5
AA as percent of entire wetland (approx.). Attach sketch map if AA is smaller than the entire contiguous wetland.	5
What percent (approx.) of the wetland were you able to visit?	5
What percent (approx.) of the AA were you able to visit?	
Were you able to ask the site owner/manager about any of the questions?	
Indicate here if you intentionally surveyed for rare plants, calciphile plants, or rare animals	
Have you attended a WESP-AC training session? If so, indicate approximate month & year	
How many wetlands have you assessed previously using WESP-AC? (approx.)	
Comments about the site or this WESP-AC assessment (attach extra page if desired):	

Form OF (Office). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Conduct an assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answering many of the questions below will equire using these online map viewers:

Google Earth Pro: https://www.google.com/earth/download/gep/agree.html

GeoNB: http://www.snb.ca/geonb1/ and http://www.snb.ca/geonb1/e/apps/apps-E.asp

Geons: http://www.snb.ca/geonol/ and http://www.snb.ca/geonol/e/apps/apps/apps-ta-asp For most wetlands, completing this office data form will require 1-2 hours. For a list of functions to which each question pertains, see bracketed abbreviations in the Definitions/Explanations column. For detailed descriptions of each WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity,

)F1	Indicators	Condition Choices	Data	Definitions/Explanations
	Province	Mark the province in which the AA is located by changing the 0 in the column next to it to a *1". Mark only one.		This determines to which province's calibration wetlands the raw score of any wetland is normalised
		New Brunswick	1	In the function and benefits models, it also triggers the automatic exclusion of indicators for which r spatial data exists in a particular province.
		Nova Scotia	0	spatial data exists in a particular province.
		Prince Edward Island	0	
		Newfoundland-Labrador	0	
2	Ponded Area Within 1 km.	The area of surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) within 1 km is:		"Adjacent" means not separated from the AA by a wide expanse (>50 m) of upland (including roa >50 m wide). Include ponded areas likely to be hidden by wetland vegetation. If surface water
		<0.01 hectare (about 10 m x 10 m).	1	extends beyond 1 km, include only the part within 1 km. Do not include tidal areas. Measure the
		0.01 - 0.1 hectare.	0	from aerial imagery using Google Earth Pro (click on Ruler icon in toolbar, then Polygon in pop-up
		0.1 - 1 hectare.	0	menu). With the GeoNB viewer, enable the Wetlands layer, then measure with the Draw & Measu
		1 to 10 hectares.	0	tool after specifying Aerial as the Basemap. However, do not rely entirely on wetland boundaries shown in online wetlands layers. [PH, SBM, WBN]
		10 to 100 hectares.	0	Stom in Gilling Reliands dyers. [17] Golff, North
		>100 hectares.	0	
3	Ponded Water & Wetland Within 1 km.	The area of wetlands and surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) within is:	n	See definition of adjacent in OF2. If the AA's wetland vegetation extends beyond 1 km, include o the part within 1 km. "Ponded" means not flowing in rivers or streams. [Sens, WBF]
		<0.01 hectare (about 10 m x 10 m).	0	
		0.01 - 0.1 hectare.	0	
		0.1 - 1 hectare.	0	
		1 to 10 hectares.	0	
		10 to 100 hectares.	0	
		>100 hectares.	1	
1	Size of Largest Nearby Vegetated Tract or	The largest vegetated patch or corridor that includes the AA's vegetation plus aladjacent upland vegetation that is not lawn, row crops, heavily grazed lands, conifer plantation is:		See definition of adjacent in OF2. Use Google Earth Pro's polygon ruler (as described above). Exclude conifer plantations only if it is obvious that trees were planted in rows. [AM, PH, SBM, Se
	Corridor	<0.01 hectare (about 10 m x 10 m).	0	
		0.01 - 0.1 hectare.	0	
		0.1 - 1 hectare.	0	
		1 to 10 hectares.	0	
		10 to 100 hectares.	0	
		100 to 1000 hectares.	1	
		>1000 hectares. [This is nearly always the answer in relatively undeveloped landscapes]	0	
5	Distance to Large Vegetated Tract	The minimum distance from theedge of the AA to the edge of the closest vegetated land (but excluding row crops, lawn, conifer plantation) larger than 375 hectares (about 2 km on a side), is:		To measure distance, use Google Earth Pro (Ruler > Line tool). Or use Draw & Measure tool at GeoNB. The 375-ha criterion is from the Fundy Model Forest Project. [AM, PH, POL, SBM, Sens
	rogotatou rrust	50 m, and not separated from the 375-ha vegetated area by any width ofpaved roads, stretches of open water, row crops, bare ground, lawn, or impervious surface. Or the AA liself contains >375 ha of vegetation. [This is often the answer in relatively undeveloped landscape	1	George The Ground Children and Tally model 1 George Fam, 11, 1 GL, 50m, 50m.
		<50 m, but completely separated from the 375-ha vegetated area by those features, and AA does not contain >375 ha of vegetation.	0

Form F (Field). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Walk for no less than 10 minutes from the wetland edge towards its core, in the part of the AA that is proposed for alteration. If no alteration is proposed, walk in a portion that appears to be most representative of the wetland overall. Walk only where it is safe and legal to do so. Conduct the assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answer these questions primarily based on your onsite observations and interpretations. Do not write in shaded parts of this data form. Answering some questions accurately may require conferring with the landowner or other knowledgable persons and/or reviewing aerial imagery. For most wetlands, completing this field data form will require 1-2 hours on a site. For a list of functions to which each question pertains, see the accompanying Interpretations form. For detailed descriptions of each WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage & Delay, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity, STR= Stressors.

	to all and	Condition of the		Definition / C. L. V.
#	Indicators	Condition Choices	Data	Definitions/Explanations
1	Wetland Type	Follow the key below and mark the ONE row that best describes MOST of the vegetated part of the AA:		Ericaceous shrubs are ones in the heather family (Ericaceae). Most have leathery evergreen leaves. They include rhododendron, azalea, swamp laurel, leatherleaf, Labrador tea, and others. Most require
		A. Moss and/or lichen cover more than 25% of the ground. Often dominated by ericaceous shrubs (e.g., Labrador tea) or other acid-tolerant plants (e.g., bog cranberry, pitcher plant, sundew, orchids). Substrate is mostly undecomposed peat. Choose between A1 and A2 and mark the choice with a 1 in their adjoining column. Otherwise go to B below.		acidic soil. Although not in the family Ericaceae, sweetgale (<i>Myrica gale</i>) should be counted also. [AM, CS, FA, FR, INV, NR, OE, PH, Sens, SFS, WBF, WBN]
		A1. Surface water is usually absent or, if present, pH is typically <4.5 and conductivity is usually <100 µS/cm (<64 ppm TDS). Trees are absent or nearly so. Sedge cover usually sparse or absent but cottongrass and/or lichen cover may be extensive, as well as cloudberry, lingonberry, sheep laurel, and a sedge (Carex rariflora). Welfand surface and surrounding landscape are seldom sloping and welfand often is domed (convex). Inlet and outlet channels are usually absent. If known, pH of peat is <4.0.	0	
		A2. Not A1. Surface water, if present, has pH typically >4.5 and conductivity is usually >100 µS/cm (>64 ppm TDS). Sedge cover is usually extensive, and/or tree and fall shrub cover is extensive. Sometimes at toe of slope or edge of water body. An exit channel is usually present. Wetter than A1 and peat depth may be shallower (<2 m).	0	
		B. Moss and/or lichen cover less than 25% of the ground. Soil is mineral or decomposed organic (muck). Choose between B1 and B2 and mark the choice with a 1 in their adjoining column:		
		B1. Trees and shrubs taller than 1 m comprise more than 25% of the vegetated cover. Surface water is mostly absent or inundates the vegetation only seasonally (e.g., vernal pools or floodplain).	1	
		B2. Not B1. Tree & tall shrubs comprise less than than 25% of the vegetated cover. Vegetation is mostly herbaceous, e.g., cattail, bulrush, burreed, pond lily, horsetail. Surface water may be extensive and fluctuates seasonally, being either persistent or drying up partly or entirely.	0	
AA shi nclude a dja d descrii	ould also include part of e the open water part ad cent " is used synonymo bed features along their	The AA should include all persistent waters in ponds smaller than 8 hectares (-283 m on a side) that are adjacent to the AA. The the water area of adjacent ponded water larger than 8 ha and adjacent rivers wider than 20 m. Specifically, the AA should lacent to wetland vegetation and equal in width to the average width of that vegetated zone. Throughout this dat form, usly with abutting, adjoining, bordering, contiguous and means no upland (manmade or natural) completely separates the directly shared edge. Features joined only by a channel are not necessarily considered to be adjacent a large portion of their res do not have to be hydrologically connected in order to be considered adjacent.		
2	Wetland Types - Adjoining or Subordinate	If the AA is smaller than 1 ha, mark all other types that occupy more than 1% of the vegetated AA. If the AA is larger than 1 ha, mark all other types which are within or adjacent to the AA and occupy more than 1 ha, as visible from the AA or as interpreted from aerial imagery. Do not mark again the type marked in F1.		1 hectare is 10,000 sq. m or about 2.5 acres. It could have dimensions of 100 m by 100 m, 1000 m by 10 m, r similar. [AM, INV, SBM, WBF]
		A1. A2.	0	
		B1.	0	
		B2.	1	
3	Woody Height & Form Diversity	Following EACH row below, indicate with a number code the percentage of the living vegetation in the AA which is occupied by that feature (6 if -95%, 5 if 75-95%, 4 if 50-75%, 3 if 25-50%, 2 if 5-25%, 1 if -45%, 0 if none). If the vegetated part of the AA is largely herbaceous (non-woody) vegetation, these percentages should not sum to 100%.		Deciduous shrubs in this region usually include buttonbush, Labrador tea, a bayberry (Morella), huckleberry, cranberry, cloudberry, sweetgale, alder, willow, birch, ash, dogwood, and a few others. If you assigned a code of 3 or higher to any of the first four choices and the ground cover beneath the trees/shrubs is ~25% moss, then question F1 might be "B1". [CS, INV, NR, PH, POL, SBM, Sens]
		coniferous trees (may include tamarack) taller than 3 m. deciduous trees taller than 3 m.	5	• • • • • • • • • • • • • • • • • • • •
		coniferous or ericaceous shrubs or trees 1-3 m tall not directly below the canopy of trees.	2	
		deciduous shrubs or trees 1-3 m tall not directly below the canopy of trees. coniferous or ericaceous shrubs <1 m tall not directly below the canopy of taller vegetation.	2	
		deciduous shrubs or trees <1 m tall (e.g., deciduous seedlings) not directly below the canopy of taller vegetation.	1	
lote :	If none of top 4 rows in	F3 was marked 2 or greater , SKIP to F9 (N fixers).		
4	Dominance of Most	Determine which two woody plant species comprise the greatest portion of the low (<3 m) woody cover . Then choose one:		[PH, POL, SBM, Sens]
	Abundant Shrub Species	those species together comprise > 50% of such cover.	1	
5	Woody Diameter	those species together do not comprise > 50% of such cover. Mark ALL the types that comprise >5% of the woody canopy cover in the AA or >5% of the wooded areas (if any) along its upland edge	0	Estimate the diameters at chest height. If small-diameter trees are overtopped (shaded) by larger
	Classes	(perimeter). The edge should include only the trees whose canopies extend into the AA.		ones, visualise a "subcanopy" at the average height of the smaller-dbh trees, to serve as a basis for t minimum 5% canopy requirement in this question. The trees and shrubs need not be wetland species

[SR, WBN] Emergent vegetation is herbaceous plants whose stems are partly above and partly below the water

FieldF form - Non-tidal Page 3 of 5

F37	Interspersion of	During most of the part of the growing season when water is present, the spatial pattern of emergent vegetation within the water is mostly:		[AM, FA, FR, INV, NR, OE, PH, PR, SBM, SR, WBF, WBN]
	Emergents & Open Water	Scattered. More than 30% of such vegetation forms small islands or corridors surrounded by water.	0	
	water	Intermediate.	0	
		Clumped. More than 70% of such vegetation is in bands along the wetland perimeter or is clumped at one or a few sides of the surface water area.	0	
F38	Persistent Deepwater	If the deepest patch of surface water (flowing or ponded) in or directly adjacent to the AA is mostly deeper than 0.5 m for >2 weeks during the	0	
F39	Area Non-vegetated Aquatic	growing season, enter "1" and continue. If not, enter "0" and SKIP to F42.(Connection). During most of the growing season and in waters deeper than 0.5 m, the cover for fish, aquatic invertebrates, and/or amphibians that is		For this question, consider only the wood that is at or above the water surface. Estimates of underwater
137	Cover Cover	provided NOT by living vegetation, but by accumulations of dead wood and undercut banks is:		wood based only on observations from terrestrial viewpoints are unreliable so should not be attempted.
		Little or none. Intermediate.	0	[AM, FA, FR, INV]
		Extensive.	0	
F40	Isolated Island	The AA contains (or is part of) an island or beaver lodge within a lake, pond, or river, and is isolated from the shore by water depths > 1 m on all sides during an average June. The island may be solid, or it may be a floating vegetation mat that is sufficiently large and dense to support a waterbird nest.	0	[WBN]
	Floating Algae & Duckweed	Al some time of the year, mats of algae and/or duckweed are likely to cover >50% of the AA's otherwise-unshaded water surface, or blankel >50% of the underwater substrate. If true, enter "1" in next column. If untrue or uncertain, enter "0".	0	[EC, PR, WBF]
F42	Channel Connection & Outflow Duration	The most persistent surface water connection (outlet channel or pipe, ditch, or overbank water exchange) between the AA and a downslope stream network is: [Note: If the AA represents only part of a welland, answer this according to whichever is the least permanent surface connection: the one between the AA and the rest of the wetland, or the surface connection between the wetland and the downslope stream network.] Persistent (surface water flows out for >9 months/year).	0	Consider the connection regardless of whether the surface water is frozen. The "downslope stream network" could consist of ditches, rivers, ponds, or lakes which eventually connect to the ocean. If this cannot be determined while visiting the AA, consult topographic maps perhaps by viewing these online with Toporama (http://atlas.nrcan.gc.ca/toporama/en/index.html) [CS, FA, FR, NR, OE, PR, Sens, SFS SR, WCv, WS]
		Seasonal (surface water flows out for 14 days to 9 months/year, not necessarily consecutive).	0	
		Temporary (surface water flows out for <14 days, not necessarily consecutive). None but maps show a stream network downslope from the AA and within a distance that is less than the AA's length. SKIP to F47 (pH	0	
		Measurement).		
		No surface water flows out of the wetland except possibly during extreme events (-once per 10 years). Or, water flows only into a wetland, ditch, or lake that lacks an outlet. SKIP to F47 (pH Measurement).	0	
F43	Outflow Confinement	During major runoff events, in the places where surface water exits the AA or connected waters nearby, the water:		"Major runoff events" would include biennial high water caused by storms and/or rapid snowmelt. [CS, NR, OE, PR, Sens, SR, STR, WS]
		Mostly passes through a pipe, culvert, narrowly breached dike, berm, beaver dam, or other partial obstruction (other than natural topography) that does not appear to drain the wetland artificially during most of the growing season.	0	
		Leaves through natural exits (channels or diffuse outflow), not mainly through artificial or temporary features.	0	
		Is exported more quickly than usual due to ditches or pipes within the AA or connected to its outlet, or within 10 m of the AA's edge, which drain the wetland artificially, or water is pumped out of the AA.	U	
F44	Tributary Channel	At least once annually, surface water from a tributary channel that is >100 m long moves into the AA. Or, surface water from a larger permanent water body adjacent to the AA spills into the AA. If it enters only via a pipe, that pipe must be fed by a mapped stream or lake further upslope. If no, SKIP to F47 (pH Measurement).	0	If inlet tributaries cannot be searched for due to inaccessibility of part of the AA, follow suggestions in F42 above. [NRv, PH, PRv, SRv]
F45	Input Water Temperature	Based on lack of shade, water source characteristics, or actual temperature measurements, the inflow is likely to be warmer than surface water in the AA during part of most years. Enter 1= yes, 0= no.	0	[wc ₄]
F46	Throughflow	During its travel through the AA at the time of peak annual flow, water arriving in channels: [select only the ONE encountered by most of the incoming water].		[FA, FR, INV, NR, OE, PR, SR, WS]
	Resistance	Does not bump into many plant stems as it travels through the AA. Nearly all the water continues to travel in unvegetated (often incised)	0	
		channels that have minimal contact with wetland vegetation, or through a zone of open water such as an instream pond or lake.		
		Bumps into herbaceous vegetation but mostly remains in fairly straight channels.	0	
		Bumps into herbaceous vegetation and mostly spreads throughout, or is in widely meandering, multi-branched, or braided channels.	0	
		Bumps into tree trunks and/or shrub stems but mostly remains in fairly straight channels. Bumps into tree trunks and/or shrub stems and follows a fairly indirect path from entrance to exit (meandering, multi-branched, or braided).	0	
F47	pH Measurement	The pH in most of the AA's surface water:		Preferably, measure this in larger areas of ponded surface water within the AA, or in streams that have passed through (not along) most of the AA. Unless surface water is completely absent, do not dig holes
		Was measured, and is: [enter the reading in the column to the right.] Was not measured but surface water is present and is darkly tea-coloured. Or if no surface water, then mosses and plants that indicate	0	or make depressions in peat in order to provide water for this measurement. Avoid measuring near
		peatland (e.g., Labrador tea) are prevalent. Enter "1".		roads or in puddles formed only by recent rain. [AM, FA, FR, NR, WBF, PH, PR, Sens, WBF, WBN]
F48	TDS and/or	Neither of above. Enter "1". The TDS (total dissolved solids) or conductivity off the AA's surface water is: (select the first true row with information):	1	See above for measurement guidance. [FR, INV, NRv, PH, PRv, Sens]
	Conductivity	TDS is: [Enter the reading in ppm or mg/L in the column to the right, if measured, or answer next row.]		
		Conductivity is [Enter the reading in µS/cm in the column to the right.]	_	
		Was not measured, but plants that indicate saline conditions cover much of the vegetated AA. Enter *1". Neither of above	0	
F49	Beaver Probability	Use of the AA by beaver during the past 5 years is (select most applicable ONE):		[FA, FR, PH, SBM, Sens, WBF, WBN]
		Evident from direct observation or presence of gnawed limbs, dams, tracks, dens, lodges, or extensive stands of water-killed trees (snags).	0	
		Likely based on known occurrence in the region and proximity to suitable habitat, which may include: (a) a persistent freshwater wetland, pond, or lake, or a perennial low or mid-gradient (<10%) channel, and (b) a corridor or multiple stands of hardwood trees and shrubs in vegetated areas near surface water.	0	
TEO.	Croundyt C'	Unlikely because site characteristics above are deficient, and/or this is a settled area or other area where beaver are routinely removed.	1	Adhere to there exists existing strictly do not we record induced to the control of the control
F50	Groundwater Strength of Evidence	Select first applicable choice: Springs are known to be present within the AA, or if groundwater levels have been monitored, that has demonstrated that groundwater primarily discharges to the wetland for longer periods during the year than periods when the wetland recharges the groundwater.	0	Adhere to these criteria strictly do not use personal judgment based on fen conditions, pH, or other evidence. Consult logorgaphic maps to detect breaks in Jospe described here. Rust deposits associated with groundwater seeps may be most noticeable as orange discoloration in ice formations along streams during early winter. [AM, CS, FA, FR, INV, NR, OE, PH, PRV, SFS, WC, WS]
		Most of the AA has a slope of >5%, or is very close to the base of a natural slope longer than 100 and much steeper than the slope of the AA, AND the pH of surface water, if known, is >5.5.	0	
FE4	Internal Condition	Neither of above is true, although some groundwater may discharge to or flow through the AA. Or groundwater influx is unknown.	1	This is not the come as the charoline along the the about the state of
F51	Internal Gradient	The gradient along most of the flow path within the AA is: <8 or the AA has no surface water outlet (not even seasonally).	0	This is not the same as the shoreline slope. It is the elevational difference between the AA's inlet and outlet, divided by the flow-distance between them and converted to percent. If available, use a
		<2% of the AA has no surface water outlet (not even seasonally). 2-5%.	1	clinometer to measure this. Free clinometer apps can be downloaded to smartphones. If the wetland is large (longer than -1 km), this may be estimated using Google Earth to determine the minimum and
		6-10%. >10%.	0	maximum elevation within the AA, then dividing by length and multiplying by 100. [CS, NR, OE, PR, SR, WBF, WBN, WS]

Assessment Area (AA) Results:

Wetland ID: MC-Trib1C-W-03

Date: 9 October 2019

Observer: Derrick Mitchell

Latitude & Longitude (decimal degrees):

Scores will appear below after data are entered in worksheets OF, F, and S. See Manual for definitions and descriptions of how scores were computed.

Wetland Functions or Other Attributes:	Function Score (Normalised)	Function Rating	Benefits Score (Normalised)	Benefits Rating	Function Score (raw)	Benefits Score (raw)
Water Storage & Delay (WS)	8.39	Higher	4.45	Moderate	8.18	4.50
Stream Flow Support (SFS)	1.20	Lower	0.00	Lower	0.64	0.00
Water Cooling (WC)	0.00	Lower	0.00	Lower	0.00	0.00
Sediment Retention & Stabilisation (SR)	3.32	Moderate	1.83	Lower	5.43	1.11
Phosphorus Retention (PR)	4.41	Higher	1.63	Lower	6.03	1.81
Nitrate Removal & Retention (NR)	10.00	Higher	3.63	Moderate	10.00	4.33
Carbon Sequestration (CS)	4.51	Moderate			6.51	
Organic Nutrient Export (OE)	5.80	Higher			5.41	
Anadromous Fish Habitat (FA)	0.00	Lower	0.00	Lower	0.00	0.00
Resident Fish Habitat (FR)	0.00	Lower	0.00	Lower	0.00	0.00
Aquatic Invertebrate Habitat (INV)	3.16	Moderate	0.91	Moderate	4.99	1.73
Amphibian & Turtle Habitat (AM)	2.81	Lower	2.39	Moderate	4.78	3.54
Waterbird Feeding Habitat (WBF)	0.00	Lower	0.00	Lower	0.00	0.00
Waterbird Nesting Habitat (WBN)	0.00	Lower	0.00	Lower	0.00	0.00
Songbird, Raptor, & Mammal Habitat (SBM)	6.79	Moderate	5.00	Moderate	5.63	5.00
Pollinator Habitat (POL)	9.20	Higher	0.00	Lower	7.41	0.00
Native Plant Habitat (PH)	4.68	Moderate	5.01	Moderate	4.97	4.35
Public Use & Recognition (PU)			2.18	Lower		1.88
Wetland Sensitivity (Sens)			1.83	Lower		2.75
Wetland Ecological Condition (EC)			3.25	Moderate		6.11
Wetland Stressors (STR) (higher score means more stress)			6.76	Higher		4.74
Summary Ratings for Grouped Functions:						
HYDROLOGIC Group (WS)	1.20	Lower	4.45	Moderate	8.18	4.50
WATER QUALITY SUPPORT Group (max+avg/2 of SR, PR, NR, CS)	7.95	Higher	2.99	Lower	8.50	3.38
AQUATIC SUPPORT Group (max+avg/2 of SFS, INV, OE, WC)	4.17	Moderate	0.61	Lower	4.08	1.16
AQUATIC HABITAT Group (max+avg/2 of FA, FR, AM, WBF, WBN)	1.68	Lower	1.43	Lower	2.87	2.13
TRANSITION HABITAT Group (max+avg/2 of SBM, PH, POL)	8.05	Higher	4.17	Moderate	6.71	4.06
WETLAND CONDITION (EC)			3.25	Moderate		6.11
WETLAND RISK (average of Sensitivity & Stressors)			4.29	Moderate		3.75

NOTE: A score of 0 does not mean the function or benefit is absent from the wetland. It means only that this wetland has a capacity that is equal or less than the lowest-scoring one, for that function or benefit, from among the 98 NB calibration wetlands that were assessed previously.

Cover Page: Basic Description of Assessment	WESP-AC version 2
Site Name	Burchill Wind Energy Project - MC-Trib1C-W-04
Investigator Name	Matt Alexander
Date of Field Assessment	8 October 2019
Nearest Town:	Lorneville (west Saint John), New Brunswick
Latitude (decimal degrees)	45.189587
Longitude (decimal degrees)	66.183085
ls a map based on a formal on-site wetland delineation available	Yes
Approximate size of the Assessment Area (AA, in hectares)	0.94
AA as percent of entire wetland (approx.). Attach sketch map if AA is smaller than the entire contiguous wetland	
What percent (approx.) of the wetland were you able to visit?	100
What percent (approx.) of the AA were you able to visit?	100
Were you able to ask the site owner/manager about any of the questions?	No
Indicate here if you intentionally surveyed for rare plants, calciphile plants, or rare animals	Yes
Have you attended a WESP-AC training session? If so, indicate approximate month & year	Yes, September 2016
How many wetlands have you assessed previously using WESP-AC? (approx.	15
Comments about the site or this WESP-AC assessment (attach extra page if desired)	

Form OF (Office). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Conduct an assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answering many of the questions below will equire using these online map viewers:

Google Earth Pro: https://www.google.com/earth/download/gep/agree.html

GeoNB: http://www.snb.ca/geonb1/ and http://www.snb.ca/geonb1/e/apps/apps-E.asp

Geons: http://www.sno.ca/geonol/ and http://www.sno.ca/geonol/e-apps/apps-e-asp
For most wetlands, completing this office data form will require 1-2 hours. For a list of functions to which each question pertains, see bracketed abbreviations in the Definitions/Explanations column. For detailed descriptions of each
WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus
Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding
Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity,

#	Indicators	Condition Choices	Data	Definitions/Explanations
F1	Province	Mark the province in which the AA is located by changing the 0 in the column next to it to a *1". Mark only one.		This determines to which province's calibration wetlands the raw score of any wetland is normalised
		New Brunswick	1	In the function and benefits models, it also triggers the automatic exclusion of indicators for which no spatial data exists in a particular province.
		Nova Scotia	0	Spatial data UNIST II a particular province.
		Prince Edward Island	0	
		Newfoundland-Labrador	0	
2	Ponded Area Within 1 km.	The area of surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) within 1 km is:		"Adjacent" means not separated from the AA by a wide expanse (>50 m) of upland (including roat >50 m wide). Include ponded areas likely to be hidden by wetland vegetation. If surface water
		<0.01 hectare (about 10 m x 10 m).	0	extends beyond 1 km, include only the part within 1 km. Do not include tidal areas. Measure the a from aerial imagery using Google Earth Pro (click on Ruler icon in toolbar, then Polygon in pop-up
		0.01 - 0.1 hectare.	0	menu). With the GeoNB viewer, enable the Wetlands layer, then measure with the Draw & Measu
		0.1 - 1 hectare.	1	tool after specifying Aerial as the Basemap. However, do not rely entirely on wetland boundaries

Form F (Field). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Walk for no less than 10 minutes from the wetland edge towards its core, in the part of the AA that is proposed for alteration. If no alteration is proposed, walk in a portion that appears to be most representative of the wetland overall. Walk only where it is safe and legal to do so. Conduct the assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answer these questions primarily based on your onsite observations and interpretations. Do not write in shaded parts of this data form. Answering some questions accurately may require conferring with the landowner or other knowledgable persons and/or reviewing aerial imagery. For most wetlands, completing this field data form will require 1-2 hours on a site. For a list of functions to which each question pertains, see the accompanying Interpretations form. For detailed descriptions of each WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage & Delay, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity, STR= Stressors.

ш	neath r	Condition of the	<u> </u>	Definitions in 1
#	Indicators	Condition Choices	Data	Definitions/Explanations
1	Wetland Type	Follow the key below and mark the ONE row that best describes MOST of the vegetated part of the AA:		Ericaceous shrubs are ones in the heather family (Ericaceae). Most have leathery evergreen leaves. They include rhododendron, azalea, swamp laurel, leatherleaf, Labrador tea, and others. Most require
		A. Moss and/or lichen cover more than 25% of the ground. Often dominated by ericaceous shrubs (e.g., Labrador tea) or other acid-tolerant plants (e.g., bog cranberry, pitcher plant, sundew, orchids). Substrate is mostly undecomposed peat. Choose between A1 and A2 and mark the choice with a 1 in their adjoining column. Otherwise go to B below.		acidic soil. Although not in the family Ericaceae, sweetgale (Myrica gale) should be counted also. [AM, CS, FA, FR, INV, NR, OE, PH, Sens, SFS, WBF, WBN]
		A1. Surface water is usually absent or, if present, pH is typically <4.5 and conductivity is usually <100 µS/cm (<64 ppm TDS). Trees are absent or nearly so. Sedge cover usually sparse or absent but cottongrass and/or lichen cover may be extensive, as well as cloudberry, lingonberry, sheep laurel, and a sedge (Carex rarillora). Wetland surface and surrounding landscape are seldom sloping and wetland often is domed (convex). Inlet and outlet channels are usually absent. If known, pH of peat is <4.0.	0	
		A2. Not A1. Surface water, if present, has pH typically >4.5 and conductivity is usually >100 µS/cm (>64 ppm TDS). Sedge cover is usually extensive, and/or tree and fall shrub cover is extensive. Sometimes at toe of slope or edge of water body. An exit channel is usually present. Wetter than A1 and peat depth may be shallower (<2 m).	0	
		B. Moss and/or lichen cover less than 25% of the ground. Soil is mineral or decomposed organic (muck). Choose between B1 and B2 and mark the choice with a 1 in their adjoining column:		
		B1. Trees and shrubs taller than 1 m comprise more than 25% of the vegetated cover. Surface water is mostly absent or inundates the vegetation only seasonally (e.g., vernal pools or floodplain).	1	
		B2. Not B1. Tree & tall shrubs comprise less than than 25% of the vegetated cover. Vegetation is mostly herbaceous, e.g., cattail, bulrush, burreed, pond lily, horsetail. Surface water may be extensive and fluctuates seasonally, being either persistent or drying up partly or entirely.	0	
IA sh ncludi adja lescri	ould also include part of a le the open water part adj cent " is used synonymo libed features along their a	the AA should include all persistent waters in ponds smaller than 8 hectares (-283 m on a side) that are adjacent to the AA. The the water area of adjacent ponded water larger than 8 ha and adjacent rivers wider than 20 m. Specifically, the AA should jacent to wetland vegetation and equal in width to the average width of that vegetated zone. Throughout this data form, usly with abutting, adjoining, bordering, contiguous and means no upland (manmade or natural) completely separates the directly shared edge. Features joined only by a channel are not necessarily considered to be adjacent a large portion of their res do not have to be hydrologically connected in order to be considered adjacent.		
2	Wetland Types - Adjoining or Subordinate	If the AA is smaller than 1 ha, mark all other types that occupy more than 1% of the vegelated AA. If the AA is larger than 1 ha, mark all other types which are within or adjacent to the AA and occupy more than 1 ha, as visible from the AA or as interpreted from aerial imagery. Do not mark again the type marked in F1.		1 hectare is 10,000 sq. m or about 2.5 acres. It could have dimensions of 100 m by 100 m, 1000 m by 10 m, or similar. [AM, INV, SBM, WBF]
		A1. A2.	0	
		B1.	0	
2		B2. Following EACH row below, indicate with a number code the percentage of the living vegetation in the AA which is occupied by that feature (6	0	Deciduous shrubs in this region usually include buttonbush, Labrador tea, bayberry (Morella),
3	Woody Height & Form Diversity	if >95%, 5 if 75-95%, 4 if 50-75%, 3 if 25-50%, 2 if 5-25%, 1 if <5%, 0 if none). If the vegetated part of the AA is largely herbaceous (non-woody) vegetation, these percentages should not sum to 100%.		Decudious striutus in tim region tosaan yin include duttinitious, Labriator lea, varyoen y (winderia), includeberry, cranberry, cloudberry, sweetigale, alder, willow, birch, ash, dogwood, and a few others. If you assigned a code of 3 or higher to any of the first four choices and the ground cover beneath the trees/shrubs is ~25% moss, then question F1 might be "B1". [CS, INV, NR, PH, POL, SBM, Sens]
		coniferous trees (may include tamarack) taller than 3 m. deciduous trees taller than 3 m.	5	
		coniferous or ericaceous shrubs or trees 1-3 m tall not directly below the canopy of trees.	3	
		deciduous shrubs or trees 1-3 m tall not directly below the canopy of trees. coniferous or ericaceous shrubs <1 m tall not directly below the canopy of taller vegetation.	1	
		deciduous shrubs or trees <1 m tall (e.g., deciduous seedlings) not directly below the canopy of taller vegetation.	1	
lote :		F3 was marked 2 or greater, SKIP to F9 (N fixers).		
4	Dominance of Most Abundant Shrub	Determine which two woody plant species comprise the greatest portion of the low (<3 m) woody cover . Then choose one:		[PH, POL, SBM, Sens]
	Species	those species together comprise > 50% of such cover. those species together do not comprise > 50% of such cover.	0	
5	Woody Diameter Classes	Mark ALL the types that comprise >5% of the woody canopy cover in the AA or >5% of the wooded areas (if any) along its upland edge (perimeter). The edge should include only the trees whose canopies extend into the AA.		Estimate the diameters at chest height. If small-diameter trees are overlopped (shaded) by larger ones, visualise a "subcanopy" at the average height of the smaller-dbh trees, to serve as a basis for t
		coniferous, 1-9 cm diameter and >1 m tall. broad-leaved deciduous 1-9 cm diameter and >1 m tall.	1	minimum 5% canopy requirement in this question. The trees and shrubs need not be wetland specie: [AM, CS, POL, SBM, Sens, WBN]
		coniferous, 10-19 cm diameter.	1	
		broad-leaved deciduous 10-19 cm diameter.	1	
		coniferous, 20-40 cm diameter. broad-leaved deciduous 20-40 cm diameter.	1	
		coniferous, >40 cm diameter.	1	
	Height Class	broad-leaved deciduous >40 cm diameter. Follow the key below and mark the ONE row that best describes MOST of the AA:	1	[AM, INV, NR, PH, SBM, Sens]
,	Height Class Interspersion	A. Neither the vegetation taller than 1 m nor the vegetation shorter than that comprise >70% of the vegetated part of the AA. They each comprise 30-70%. Choose between A1 and A2 and mark the choice with a 1 in the adjoining column. Otherwise go to B below.		[Part, 1114, 111, 2000), 2013]
		A1. The two height classes are mostly scattered and intermixed throughout the AA.	0	
		A2. Not A1. The two height classes are mostly in separate zones or bands, or in proportionately large clumps. B. Either the vegetation shorter than 1 m comprises >70% of the vegetated part of the AA, or the vegetation taller than that does. One size	0	
		B. Either the vegetation shorter than 1 m comprises >70% of the vegetated part of the AA, of the vegetation failer than that does. One size class might even be totally absent. Choose between B1 and B2 and mark the choice with a 1 in the adjoining column:		
		B1. The less prevalent height class is mostly scattered and intermixed within the prevalent one. B2. Not B1. The less prevalent height class is mostly located apart from the prevalent one, in separate zones or clumps, or is completely	0	
7	Large Snags (Dead	B1. The less prevalent height class is mostly scattered and intermixed within the prevalent one.		
7	Large Snags (Dead Standing Trees)	B1. The less prevalent height class is mostly scattered and intermixed within the prevalent one. B2. Not B1. The less prevalent height class is mostly located apart from the prevalent one, in separate zones or clumps, or is completely absent. The number of large snags (diameter >20 cm) in the AA plus adjacent upland area within 10 m of the wetland edge is: None, or fewer than 8/ hectare which exceed this diameter.	0	Snags are dead standing trees that often (not always) lack bark and foliage. Include only ones that ar at least 2 m tall. [POL, SBM, WBN]
7		B1. The less prevalent height class is mostly scattered and intermixed within the prevalent one. B2. Not B1. The less prevalent height class is mostly located apart from the prevalent one, in separate zones or clumps, or is completely absent. The number of large snags (diameter >20 cm) in the AA plus adjacent upland area within 10 m of the wetland edge is: None, or fewer than 8/ hectare which exceed this diameter. Several (>8/hectare) and a pond, lake, or slow-flowing water wider than 10 m is within 1 km.	0	
7		B1. The less prevalent height class is mostly scattered and intermixed within the prevalent one. B2. Not B1. The less prevalent height class is mostly located apart from the prevalent one, in separate zones or clumps, or is completely absent. The number of large snags (diameter >20 cm) in the AA plus adjacent upland area within 10 m of the wetland edge is: None, or fewer than 8/ hectare which exceed this diameter.	0	Snags are dead standing trees that often (not always) lack bark and foliage. Include only ones that ar at least 2 m tail. [POL, SBM, WBN] Exclude temporary "burn piles." [AM, INV, POL, SBM]
7	Standing Trees)	B1. The less prevalent height class is mostly scattered and intermixed within the prevalent one. B2. Not B1. The less prevalent height class is mostly located apart from the prevalent one, in separate zones or clumps, or is completely absent. The number of large snags (diameter >20 cm) in the AA plus adjacent upland area within 10 m of the wetland edge is: None, or fewer than 8/ hectare which exceed this diameter. Several (>8/hectare) and a pond, lake, or slow-flowing water wider than 10 m is within 1 km. Several (>8/hectare) but above not true.	0	at least 2 m tall. [POL, SBM, WBN]

FieldF form - Non-tidal Page 1 of 5

FO	N Fixers	The percentage of the AA's vegetated cover that contains nitrogen-fixing plants (e.g., alder, sweetgale, clover, lupine, alfalfa, other legumes)		Do not include N-fixing algae or lichens. [FA, FR, INV, NRv, OE, PH, SBM, Sens]
1 7	IN FIXEIS	is:		DO NOT INCIDUDE NATIONING ANGLE OF INCIDENTS. [F.A, F.N., INV., INV., O.E., F.N., SEIN, SEINS]
		<1% or none.	1	
		1-25% of the vegetated cover, in the AA or along its water edge (whichever has more).	0	
		25-50% of the vegetated cover, in the AA or along its water edge (whichever has more). 50-75% of the vegetated cover, in the AA or along its water edge (whichever has more).	0	
		>75% of the vegetated cover, in the AA or along its water edge (whichever has more).	0	
F10	Sphagnum Moss	The cover of Sphagnum moss (or any moss that forms a dense cushion many centimeters thick), including the moss obscured by taller		Exclude moss growing on trees and rocks. [CS, PH]
	Extent	sedges and other plants rooted in it, is:		
		<5% of the vegetated part of the AA.	0	
		5-25% of the vegetated part of the AA. 25-50% of the vegetated part of the AA.	0	
		50-95% of the vegetated part of the AA.	1	
		>95% of the vegetated part of the AA.	0	
F11	% Bare Ground &	Consider the parts of the AA that lack surface water at the driest time of the growing season. Viewed from directly above the ground layer, the		Thatch is dead plant material (stems, leaves) resting on the ground surface. Bare ground that is
	Thatch	predominant condition in those areas at that time is:		present under a tree or shrub canopy should be counted. Boulders count as bare ground. Wetlands with mineral soils and that are heavily shaded or are dominated by annual plant species tend to have
		Little or no (<5%) bare ground is visible between erect stems or under canopy anywhere in the vegetated AA. Ground is extensively blanketed by dense thatch, moss, lichens, graminoids with great stem densities, or plants with ground-hugging foliage.	1	more extensive areas that are bare during the early growing season. [AM, EC, INV, NR, OE, POL, PR, SBM, Sens]
		Slightly bare ground (5-20% bare between plants) is visible in places, but those areas comprise less than 5% of the unflooded parts of the AA.	0	
		Much bare ground (20-50% bare between plants) is visible in places, and those areas comprise more than 5% of the unflooded parts of the AA.	0	
		Other conditions.	0	
E10	Constant less entretts	Not applicable. Surface water (either open or obscured by emergent plants) covers all of the AA all the time.	0	The description of the second state of the FC IAM AID DISTRICT OR AID THE
F12	Ground Irregularity	Imagine the AA without any living vegetation. Excluding the portion of the AA that is always under water, the number of hummocks, small pits, raised mounds, animal burrows, ruts, guilles, natural levees, microdepressions, and other areas of peat or mineral soil that are raised or depressed >10 cm compared to most of the area within a few meters surrounding them is:		The depressions may be of human or natural origin. [AM, EC, INV, NR, PH, POL, PR, SBM, SR, WS]
		Few or none (minimal microtopography; <1% of the land has such features, or entire AA is always water-covered).	0	
		Intermediate.	1	
		Several (extensive micro-topography).	0	
F13	Upland Inclusions	Within the AA, inclusions of upland are:		[AM, NR, SBM]
		Few or none.	1	
		Intermediate (1 - 10% of vegetated part of the AA).	0	
E1.4	Coil Touture	Many (e.g., wetland-upland "mosaic", >10% of the vegetated AA).	0	ICC MD OF DI DD Core CFC WCI
F14	Soil Texture	In parts of the AA that lack persistent water, the texture of soil in the uppermost layer is mostly: [To determine this, use a trowel to check in at least 3 widely spaced locations, and use the soil texture key (in Appendix A of the Manual).]		[CS, NR, OE, PH, PR, Sens, SFS, WS]
		Loamy: soils that may contain a little fine grit and do not make a "ribbon" longer than 2 cm when moistened, rolled, squeezed, and extended	0	
		between thumb and forefinger.		
		Fines: includes silt, clay, silt, soils that make a ribbon longer than 2 cm when moistened, rolled, squeezed, and extended between thumb and	1	
		forefinger. Deep Peat, to 40 cm depth or greater.	0	
		Shallow Peat or organic <40 cm deep.	0	
		Coarse: includes sand, loamy sand, gravel, cobble, soils that do not make a ribbon when moistened, rolled, squeezed, and extended	0

F15	Shorebird Feeding Habitats	During any 2 consecutive weeks of the growing season, the extent of mudflats, bare unshaded saturated areas not covered by thatch, and unshaded waters shallower than 6 cm is: [Include also any area that is adjacent to the AA.]		This addresses needs of many but not all migratory sandpipers, plovers, and related species. [WBF]
	ridolidio	None, or <100 sq. m.	1	
		100-1000 sq. m.	0	
		1000 – 10,000 sq. m.	0	
Г14	Harbanaus (/ of	>10,000 sq. m.	0	[AM, WBF, WBN]
F16	Herbaceous % of Vegetated Wetland	In aerial ("ducks eye") view, the maximum annual cover of herbaceous vegetation (all non-woody plants except moss) is:		[AM, WOF, WON]
	3	<5% of the vegetated part of the AA or <0.01 hectare (whichever is less). Mark "1" here and SKIP to F20 (Invasive Plant Cover). 5-25% of the vegetated part of the AA.	0	
		25-50% of the vegetated part of the AA.	0	
		50-95% of the vegetated part of the AA.	0	
		>95% of the vegetated part of the AA.	0	
F17	Forb Cover	Within parts of the AA having herbaceous cover (excluding SAV), the areal cover of forbs reaches an annual maximum of:		Forbs are flowering plants. Do not include grasses, sedges, cattail, other graminoids, ferns, horsetails,
		<5% of the herbaceous part of the AA.	0	or others that lack showy flowers. [POL]
		5-25% of the herbaceous part of the AA.	0	
		25-50% of the herbaceous part of the AA. 50-95% of the herbaceous part of the AA.	0	-
		>95% of the herbaceous part of the AA.	0	
F18	Sedge Cover	Sedges (Carex spp.) and cottongrass (Eriophorum spp.) occupy:	Ť	[CS]
		<5% of the vegetated area, or none.	0	
		5-50% of the vegetated area.	0	
		50-95% of the vegetated area.	0	
Ec.		>95% of the vegetated area.	0	
F19	Dominance of Most Abundant Herbaceous	Determine which two herbaceous species comprise the greatest portion of the herbaceous cover (excluding mosses and floating-leaved aquatic plants). Then choose one of the following:		For this question, include ferns as well as graminoids and forbs. [EC, INV, PH, POL, Sens]
	Species	those species together comprise > 50% of the areal cover of herbaceous plants at any time during the year.	0	
		those species together do not comprise > 50% of the areal cover of herbaceous plants at any time during the year.	0	1
F20	Invasive Plant Cover	How extensive is the cover of invasive plant species in the AA? For species, see Plants_invasive worksheet in the accompanying Supplinfo		[EC, PH, POL, Sens]
		file. invasive species appear to be absent in the AA, or are present only in trace amount (a few individuals).	0	
		invasive species appear to be absent in the AA, or are present only in trace amount (a tew individuals). invasive species are present in more than trace amounts, but comprise <5% of herbaceous cover (or woody cover, if the invasives are	1	
		woody).		
		invasive species comprise 5-20% of the herb cover (or woody cover, if the invasives are woody).	0	
		invasive species comprise 20-50% of the herb cover (or woody cover, if the invasives are woody).	0	
F21	Invasive Cover Along	invasive species comprise >50% of the herb cover (or woody cover, if the invasives are woody). Along the wetland-upland boundary, the percent of the upland edge (within 3 m upslope from the wetland) that is occupied by invasive plant	0	If a plant cannot be identified to species (e.g., winter conditions) but its genus contains an exotic
F21	Invasive Cover Along Upland Edge	species is:		species, assume the unidentified plant to also be exotic. If vegetation is so senesced that exotic
		none of the upland edge (invasives apparently absent), or AA has no upland edge.	0	species cannot be identified, answer "none". [PH, STR]
		some (but <5%) of the upland edge.	1	
		5-50% of the upland edge. most (>50%) of the upland edge.	0	
F22	Fringe Wetland	During most of the year, open water within or adjacent to the vegetated part of the wetland is much wider than the maximum width of the	0	[WBF, WBN, WCv]
	3	vegetated zone within the wetland. Enter "1" if true, "0" if false.		
	Lacustrine Wetland	The vegetated part of the AA is within or adjacent to a body of non-tidal standing open water whose size exceeds 8 hectares during most of	0	[FR, PR, PU, WBF, WBN]
F23	Edddsiiiio Wolland	a normal year.		

FieldF form - Non-tidal Page 2 of 5

F24	% of AA Without Surface Water	The percentage of the AA that never contains <u>surface</u> water during an average year (that is, except perhaps for a few hours after snowmelt or rainstorms), but which is still a wetland, is:		1 hectare is 10,000 sq. m or about 2.5 acres. It could have dimensions of 100 m by 100 m, 1000 m by 10 m, or similar. [AM, FA, FR, INV, NR, PH, PR, SBM, Sens, SRv, WBF, WBN, WC]
		<1%. In other words, all or nearly all of the AA is covered by water permanently or at least seasonally.	0	
		1-25% of the AA, or <1% but >0.01 ha never contains surface water. 25-50% of the AA never contains surface water.	0	-
		50-75% of the AA never contains surface water.	0	1
		75-99% of the AA never contains surface water, or >99% AND there is at least one persistent water body larger than 1 ha in the AA.	0	
		99-100%. AND there is no persistent ponded water body larger than 1 ha within the AA. Enter *1* and SKIP to F42 (Channel Connection).	1	
F25	% of AA with Persistent Surface Water	Identify the parts of the AA that still contain surface water (flowing or ponded, open or hidden beneath vegetation) even during the driest limes of a normal year, i.e., when the AA's surface water is at its lowest annual level. At that time, the percentage of the AA that still contains surface water is:		If you are unable to determine the condition at the driest time of year, ask the land owner or neighbors about it if possible. Indicators of persistence may include fish, some dragonflies, beaver, and muskrat. [AM, CS, FA, FR, INV, NR, POL, PR, SBM, WBF, WBN]
	Water	None. The AA dries up completely (no water in channels either) or never has surface water during most years. SKIP to F27.	0	
		1-20% of the AA.	0	
		20-50% of the AA. 50-95% of the AA.	0	-
		>95% of the AA. True for many fringe wetlands.	0	
F26	% of Summertime Water that Is Shaded	At mid-day during the warmest time of year, the area of surface water <u>within</u> the AA that is shaded by vegetation and other features that are <u>within</u> the AA at that time is:		[FA, WC]
	water that is shaded	<5% of the water is shaded, or no surface water is present then.	0	
		5-25% of the water is shaded.	0	
		25-50% of the water is shaded. 50-75% of the water is shaded.	0	
		>75% of the water is shaded.	0	
F27	% of AA that is	The percentage of the AA's area that is between the annual high water and the annual low water (surface water) is:		Flood marks (algal mats, adventitious roots, debris lines, ice scour, etc.) are often evident when not
	Flooded Only Seasonally	None, or <0.01 hectare and <1% of the AA. SKIP to F29.	0	fully inundated. Also, such areas often have a larger proportion of upland and annual (vs. perennial) plant species. In riverine systems, the extent of this zone can be estimated by multiplying by 2 the
	Seasonally	1-20% of the AA, or <1% but >0.01 ha.	0	bankful height and visualising where that would intercept the land along the river. [CS, FA, INV, NR,
		20-50% of the AA. 50-95% of the AA.	0	OE, PH, SR, WBF, WBN, WS]
		>95% of the AA.	0	
F28	Annual Water	The annual fluctuation in surface water level within most of the parts of the AA that contain surface water at least temporarily is:		Look for flood marks (see above). Because the annual range of water levels is difficult to estimate without multiple visits, consider asking the land owner or neighbors about it. [AM, CS, INV, NR, OE, PH,
	Fluctuation Range	<10 cm change (stable or nearly so).	0	PR, SR, WBN, WS]
		10 cm - 50 cm change. 0.5 - 1 m change.	0	1
		1-2 m change.	0	
		>2 m change.	0	
Is the A (Conne F29		d water smaller than 0.01 hectare (about 10m x 10m, or 1m x 100 m)? If so, enter "1" in column D and SKIP TO F42	0	If a boat is unavailable, estimate this by considering wetland size and local topography. Or if timing and
1 2 7	Class	During most of the time when surface water is present during the growing season, its depth, averaged over the entire inundated part of the AA, is:		safety allow, depths may be measured by drilling through winter ice. This question is asking about the
		<10 cm deep (but >0).	0	spatial median depth that occurs during most of that time, even if inundation is only seasonal or temporary. If inundation in most but not all of the wetland is brief, the answer will be based on the depth
		10 - 50 cm deep. 0.5 - 1 m deep.	0	of the most persistently inundated part of the wetland. Include surface water in channels and ditches as
		0.5 - Гиг deep. 1 - 2 m deep.	0	well as ponded areas. [CS, FA, FR, INV, OE, PH, PR, Sens, SFS, SR, WBF, WBN, WC]
		>2 m deep. True for many fringe wetlands.	0	
F30	Depth Classes - Evenness of	When present, surface water in most of the AA usually consists of (select one):		Estimate these proportions by considering the gradient and microtopography of the site. [FR, INV, WBF, WBN]
	Proportions	One depth class that comprises >90% of the AA's inundated area (use the classes in the question above). One depth class that comprises 50-90% of the AA's inundated area.	0	,
		Neither of above. There are 3 or more depth classes and none occupy >50%.	0	1
F31	% of Water That Is Ponded (not Flowing)	During most times when surface water is present, the percentage that is (1) ponded (stagnant, or flows so slowly that fine sediment is not held in suspension) AND (2) is likely to be deeper than 0.5 m in some places, is:		Nearly all wellands with surface water have some ponded water. [AM, CS, INV, NR, OE, PR, Sens, SR, WBF, WBN, WC, WS]
		<5% of the water, or it occupies <100 sq.m cumulatively. Nearly all the surface water is flowing. SKIP to F34.	0	
		5-30% of the water. 30-70% of the water.	0	1
		70-95% of the water.	0	
F32	Ponded Open Water - Minimum Size	>95% of the water. During most of the growing season, the largest patch of open water that is ponded and is in or bordering the AA is >0.01 hectare (about 10 mb y 10 m) and mostly deeper than 0.5 m. If true enter "1" and continue, If false, enter "0" and SKIP to F41 (Floating Algae & Duckweed).	0	Open water is not obscured by vegetation in aerial ("duck's eye") view. It includes vegetation floating on the water surface or entirely submersed beneath it.
F33	% of Ponded Water	In ducks-eye aerial view, the percentage of the ponded water that is open (lacking emergent vegetation during most of the growing season,		[AM, CS, FA, FR, INV, NR, OE, PR, SR, WBF, WBN, WC]
	that is Open	and unhidden by a forest or shrub canopy) is:	0	
		None, or <1% of the AA and largest pool occupies <0.01 hectares. Enter "1" and SKIP to F41 (Floating Algae & Duckweed). 1-4% of the ponded water. Enter "1" and SKIP to F41 (Floating Algae & Duckweed).	0	1
		5-30% of the ponded water.	0	
		30-70% of the ponded water.	0	
		70-99% of the ponded water. 100% of the ponded water.	0	1
F34	Width of Vegetated	At the time during the growing season when the AA's water level is lowest, the average width of vegetated area in the AA that separates		"Vegetated area" does not include underwater or floating-leaved plants, i.e., aquatic bed. Width may
	Zone within Wetland	adjoining uplands from open water within the AA is: <1 m.	0	include wooded riparian areas if they have wetland soil or plant indicators. [AM, CS, NR, OE, PH, PR, SBM, Sens, SR, WBN]

F43	Outflow Confinement	During major runoff events, in the places where surface water exits the AA or connected waters nearby, the water: Mostly passes through a pipe, culvert, narrowly breached dike, berm, beaver dam, or other partial obstruction (other than natural topography)	0	"Major runoff events" would include biennial high water caused by storms and/or rapid snowmelt. [CS, NR, OE, PR, Sens, SR, STR, WS]
		that does not appear to drain the wetland artificially during most of the growing season.		
		Leaves through natural exits (channels or diffuse outflow), not mainly through artificial or temporary features. Is exported more quickly than usual due to ditches or pipes within the AA or connected to its outlet, or within 10 m of the AA's edge, which	0	
F44	Tributary Channel	drain the wetland artificially, or water is pumped out of the AA. At least once annually, surface water from a tributary channel that is >100 m long moves into the AA. Or, surface water from a larger		If inlet tributaries cannot be searched for due to inaccessibility of part of the AA, follow suggestions in
		permanent water body adjacent to the AA spills into the AA. If it enters only via a pipe, that pipe must be fed by a mapped stream or lake further upslope. If no, SKIP to F47 (pH Measurement).	0	F42 above. [NRv, PH, PRv, SRv]
F45	Input Water Temperature	Based on lack of shade, water source characteristics, or actual temperature measurements, the inflow is likely to be warmer than surface water in the AA during part of most years. Enter 1= yes, 0= no.	0	[WCv]
F46	Throughflow Resistance	During its travel through the AA at the time of peak annual flow, water arriving in channels: [select only the ONE encountered by most of the incoming water].		[FA, FR, INV, NR, OE, PR, SR, WS]
	resistance	Does not bump into many plant stems as it travels through the AA. Nearly all the water continues to travel in unvegetated (often incised) channels that have minimal contact with wetland vegetation, or through a zone of open water such as an instream pond or lake.	0	
		Bumps into herbaceous vegetation but mostly remains in fairly straight channels.	0	
		Bumps into herbaceous vegetation and mostly spreads throughout, or is in widely meandering, multi-branched, or braided channels.	0	
		Bumps into tree trunks and/or shrub stems but mostly remains in fairly straight channels. Bumps into tree trunks and/or shrub stems and follows a fairly indirect path from entrance to exit (meandering, multi-branched, or braided).	0	
F47	pH Measurement	The pH in most of the AA's surface water:		Preferably, measure this in larger areas of ponded surface water within the AA, or in streams that have
		Was measured, and is: [enter the reading in the column to the right.]		passed through (not along) most of the AA. Unless surface water is completely absent, do not dig holes or make depressions in peat in order to provide water for this measurement. Avoid measuring near
		Was not measured but surface water is present and is darkly tea-coloured. Or if no surface water, then mosses and plants that indicate peatland (e.g., Labrador tea) are prevalent. Enter "1". Neither of above. Enter "1".	0	roads or in puddles formed only by recent rain. [AM, FA, FR, NR, WBF, PH, PR, Sens, WBF, WBN]
F48	TDS and/or	The TDS (total dissolved solids) or conductivity off the AA's surface water is: (select the first true row with information):		See above for measurement guidance. [FR, INV, NRv, PH, PRv, Sens]
	Conductivity	TDS is: [Enter the reading in ppm or mg/L. in the column to the right, if measured, or answer next row.] Conductivity is: [Enter the reading in µS/cm in the column to the right.]		
		Was not measured, but plants that indicate saline conditions cover much of the vegetated AA. Enter *1*.	0	
F49	Beaver Probability	Neither of above Use of the AA by beaver during the past 5 years is (select most applicable ONE):	1	[FA, FR, PH, SBM, Sens, WBF, WBN]
1 47		Evident from direct observation or presence of gnawed limbs, dams, tracks, dens, lodges, or extensive stands of water-killed trees (snags).	0	(ra, ra, ra, sona, sona, wong
		Likely based on known occurrence in the region and proximity to suitable habitat, which may include: (a) a persistent freshwater wetland,	0	
		pond, or lake, or a perennial low or mid-gradient (<10%) channel, and (b) a corridor or multiple stands of hardwood trees and shrubs in vegetated areas near surface water.		
		Unlikely because site characteristics above are deficient, and/or this is a settled area or other area where beaver are routinely removed.	1	
F50	Groundwater Strength of Evidence	Select first applicable choice:		Adhere to these criteria strictly do not use personal judgment based on fen conditions, pH, or other evidence. Consult topographic maps to detect breaks in slope described here. Rust deposits
		Springs are known to be present within the AA, or if groundwater levels have been monitored, that has demonstrated that groundwater primarily discharges to the wetland for longer periods during the year than periods when the wetland recharges the groundwater.	0	associated with groundwater seeps may be most noticeable as orange discoloration in ice formations along streams during early winter. [AM, CS, FA, FR, INV, NR, OE, PH, PRv, SFS, WC, WS]
		Most of the AA has a slope of >5%, or is very close to the base of a natural slope longer than 100 and much steeper than the slope of the AA, AND the pH of surface water, if known, is >5.5. Neither of above is true, although some groundwater may discharge to or flow through the AA. Or groundwater influx is unknown.	0	
F51	Internal Gradient	Neimer or above is true, aimough some groundwater may discharge to or now through the AA. Or groundwater influx is unknown. The gradient along most of the flow path within the AA is:	1	This is not the same as the shoreline slope. It is the elevational difference between the AA's inlet and
		<2% or the AA has no surface water outlet (not even seasonally).	1	outlet, divided by the flow-distance between them and converted to percent. If available, use a clinometer to measure this. Free clinometer apps can be downloaded to smartphones. If the wetland is
		2-5%. 6-10%.	0	large (longer than –1 km), this may be estimated using Google Earth to determine the minimum and maximum elevation within the AA, then dividing by length and multiplying by 100. [CS, NR, OE, PR,
		>10%.	0	SR, WBF, WBN, WS]
Note for		ions: If the AA lacks an upland edge, evaluate based on the AA's entire perimeter, and moving outward into whatever areas are nese questions are best answered by measuring from aerial images.		
		Within a zone extending 30 m laterally from the AA's edge with upland and/or other wetlands, the percentage that contains perennial		[AM, FA, FR, INV, NRv, PH, POL, PRv, SBM, Sens, SRv, STR, WBN]
	Vegetated Buffer as %			[MI, FA, FI, MV, MV, FI, FOE, FIV, SDM, SCIS, SIV, STI, WON]

FieldF form - Non-tidal Page 4 of 5

53	Type of Cover in Buffer	Within 30 m upslope of where the wetland transitions to upland, the upland land cover that is NOT perennial vegetation is mostly (mark ONE):		[AM, FA, INV, NRv, PH, POL, SBM, STR, WBN]
	Type or devel in Bullet	, , , , , , , , , , , , , , , , , , , ,		
		Impervious surface, e.g., paved road, parking lot, building, exposed rock.	0	
		Bare or nearly bare pervious surface or managed vegetation, e.g., lawn, row crops, unpaved road, dike, landslide.	0	
54	Buffer Slope	The steepest and/or most disturbed part of the upland area that is within 30 m of the wetland and occupies >10% of that upland area has a percent slope of:		[NRv, PRv, Sens, SRv]
		<1% (flat almost no noticeable slope) or all the area within 30 m of the AA edge is other wetlands. 2.5%.	0	
		5-30%.	0	-
		>30%.	0	1
55	Cliffs or Steep Banks	In the AA or within 100 m, there are elevated terrestrial features such as cliffs, talus slopes, stream banks, or excavated pits (but not riprap)	0	Do not include upturned trees as potential den sites. [POL, SBM]
	Ollis of Steep Ballics	that extend at least 2 m nearly vertically, are unvegetated, and potentially contain crevices or other substrate suitable for nesting or den areas. Enter 1 (yes) or 0 (no).		So not minute dynamical trees as potential data sites. [1-Oct, Octor)
56	New or Expanded Wetland	Human actions within or adjacent to the AA have persistently expanded a naturally occurring wetland or created a wetland where there previously was none (e.g., by excavation, impoundment):		Determine this using historical aerial photography, old maps, soil maps, or permit files as available [C NR, OE, PH, Sens]
		No.	0	
		Yes, and created or expanded 20 - 100 years ago.	0	
		Yes, and created or expanded 3-20 years ago.	0	
		Yes, and created or expanded within last 3 years.	0	
		Yes, but time of origin or expansion unknown.	0	
		Unknown if new or expanded within 20 years or not.	1	
57	Burn History	More than 1% of the AA's previously vegetated area:		Look for charred soil or stumps (in multiple widely-spaced locations) or ask landowner. [CS, PH, STR]
		Burned within past 5 years.	0	-
		Burned 6-10 years ago.	0	-
		Burned 11-30 years ago.	0	
58	Vicibility	Burned >30 years ago, or no evidence of a burn and no data. The maximum percentage of the wetland that is visible from the best vantage point on public roads, public parking lots, public buildings, or	1	[DIL STD WDEv]
38	Visibility	the maximum percentage of the wegand that is visible from the best variable point on public roads, public parking lots, public buildings, or public maintained trails that intersect, adjoin, or are within 100 m of the AA (select one) is:		[PU, STR, WBFv]
		<25%.	1	
		25-50%.	0	
		>50%.	0	
59	Non-consumptive	Assuming access permission was granted, select ALL statements that are true of the AA as it currently exists:		[PU, STR]
	Uses - Actual or Potential	For an average person, walking is physically possible in (not just near) >5% of the AA during most of the growing season, e.g., free of deep water and dense shrub thickets.	1	
		water am dense struct mickets. Maintained roads, parking areas, or fool-trails are within 10 m of the AA, or the AA can be accessed part of the year by boats arriving via contiguous waters.	0	
		Within or near the AA, there is an interpretive center, trails with interpretive signs or brochures, and/or regular guided interpretive tours.	0	
60	Unvisited Core Area	The percentage of the AA almost never visited by humans during an average growing season probably comprises: [<u>Note:</u> Only include the part actually walked or driven (not simply viewed from) with a vehicle or boat. Do not include visitors on traits outside of the AA unless more		[AM, FAv, FRv, PH, PU, SBM, STR, WBF, WBN]
		part actuary waters of a time (pot simply werear from) man a venture of coat. Do not include visitus on frain coatside of the real state of the melland is visible from the trails and they are within 30 m of the welland edge. In that case include only the area occupied by the trail.]		
		<5% and no inhabited building is within 100 m of the AA.	0	
		<5% and inhabited building is within 100 m of the AA.	0	1
		5-50% and no inhabited building is within 100 m of the AA.	0	1
		5-50% and inhabited building is within 100 m of the AA.	0	1
		50-95%, with or without inhabited building nearby.	0	1
		>95% of the AA with or without inhabited building nearby.	1	
61	Frequently Visited Area	The part of the AA visited by humans almost daily for several weeks during an average growing season probably comprises: [See note above.]		[AM, PH, PU, SBM, STR, WBF, WBN]
	Alea	<5%. If F60 was answered ">95%" (mostly never visited), SKIP to F64.	1	
		5-50%.	0	
		50-95%.	0	1
		>95% of the AA.	0	1
62	BMP - Soils	Boardwalks, paved trails, fences or other infrastructure and/or well-enforced regulations appear to effectively prevent visitors from walking on soil within nearly all of the AA when the soil is unfrozen. Enter "1" if true.	0	[PH, PU]
63	BMP - Wildlife Protection	Fences, observation blinds, platforms, paved trails, exclusion periods, and/or well-enforced prohibitions on motorised boats, off-leash pets, and off road vehicles appear to effectively exclude or divert visitors and their pets from the AA at critical times in order to minimize disturbance of wildlife (except during hunting seasons). Enter *1* if true.	0	[AM, PU, WBF, WBN]
64	Consumptive Uses	Recent evidence was found within the AA of the following potentially-sustainable consumptive uses. Select ALL that apply.		[FAv, FRv, WBFv]
	(Provisioning Services)	Low-impact commercial timber harvest (e.g., selective thinning).	1	1
		Commercial or traditional-use harvesting of native plants, their fruits, or mushrooms.	0	1
		Waterfowl hunting.	0	1
		Fishing.	0	
		Trapping of furbearers.	0	
		None of the above.	0	
65	Domestic Wells	The closest wells or water bodies that currently provide drinking water are:		[NRv]
		Within 0-100 m. of the AA.	0]
		100-500 m. away.	0	
		>500 m. away, or no information.	1	
66	Calcareous Fen	The AA is, or is part of, a calcareous fen. See the Plants_Calcar worksheet in the accompanying Supplnfo file for list of plant indicators	0	[PH, PR]

WETLAND RISK (average of Sensitivity & Stressors)			1.27	Lower		2.54
	NOTE: A coor	e of 0 does not	mean the func	tion or benefit i	e abcent from t	he wetland It

NOTE: A score of 0 does not mean the function or benefit is absent from the wetland. It means only that this wetland has a capacity that is equal or less than the lowest-scoring one, for that function or benefit, from among the 98 NB calibration wetlands that were assessed previously.

Cover Page: Basic Description of Assessment	WESP-AC version 2
Site Name:	Burchill Wind Energy Project - MC-Trib1D-W-01
Investigator Name:	Derrick Mitchell
Date of Field Assessment:	9 October 2019
Nearest Town:	Lorneville (west Saint John), New Brunswick
Latitude (decimal degrees):	45.192384
Longitude (decimal degrees):	-66.186994
Is a map based on a formal on-site wetland delineation available?	Yes
Approximate size of the Assessment Area (AA, in hectares):	5
AA as percent of entire wetland (approx.). Attach sketch map if AA is smaller than the entire contiguous wetland.	
What percent (approx.) of the wetland were you able to visit?	5
What percent (approx.) of the AA were you able to visit?	100
Were you able to ask the site owner/manager about any of the questions?	No
Indicate here if you intentionally surveyed for rare plants, calciphile plants, or rare animals	Yes
Have you attended a WESP-AC training session? If so, indicate approximate month & year	Yes, September 2016
How many wetlands have you assessed previously using WESP-AC? (approx.)	100+
Comments about the site or this WESP-AC assessment (attach extra page if desired):	

Da	te: 9 October 2019	Site Identifier: MC-Trib1D-W-01	Investigator:	Derrick M	itche
----	--------------------	---------------------------------	---------------	-----------	-------

Form F (Field). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Walk for no less than 10 minutes from the wetland edge towards its core, in the part of the AA that is proposed for alteration. If no alteration is proposed, walk in a portion that appears to be most representative of the wetland overall. Walk only where it is safe and legal to do so. Conduct the assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answer these questions primarily based on your onsite observations and interpretations. Do not write in shaded parts of this data form. Answering some questions accurately may require conferring with the landowner or other knowledgable persons and/or reviewing aerial imagery. For most wetlands, completing this field data form will require 1-2 hours on a site. For a list of functions to which each question pertains, see the accompanying Interpretations form. For detailed descriptions of each WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage & Delay, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity, STR= Stressors.

,,	to die	Condition of the	D. I	Definitions In 1 11
#	Indicators	Condition Choices	Data	Definitions/Explanations
1	Wetland Type	Follow the key below and mark the ONE row that best describes MOST of the vegetated part of the AA:		Ericaceous shrubs are ones in the heather family (Ericaceae). Most have leathery evergreen leaves. They include rhododendron, azalea, swamp laurel, leatherleaf, Labrador tea, and others. Most require
		A. Moss and/or lichen cover more than 25% of the ground. Often dominated by ericaceous shrubs (e.g., Labrador tea) or other acid-tolerant plants (e.g., bog cranberry, pitcher plant, sundew, orchids). Substrate is mostly undecomposed peat. Choose between A1 and A2 and mark the choice with a 1 in their adjoining column. Otherwise go to B below.		acidic soil. Although not in the family Ericaceae, sweetgale (<i>Myrica gale</i>) should be counted also. [AM, CS, FA, FR, INV, NR, OE, PH, Sens, SFS, WBF, WBN]
		A1. Surface water is usually absent or, if present, pH is typically <4.5 and conductivity is usually <100 µS/cm (<64 ppm TDS). Trees are absent or nearly so. Sedge cover usually sparse or absent but cottongrass and/or lichen cover may be extensive, as well as cloudberry, lingonberry, sheep laurel, and a sedge (Carex rarillora). Welfand surface and surrounding landscape are seldom sloping and welfand often is domed (convex). Inlet and outlet channels are usually absent. If known, pH of peat is <4.0.	0	
		A2. Not A1. Surface water, if present, has pH typically >4.5 and conductivity is usually >100 µS/cm (>64 ppm TDS). Sedge cover is usually extensive, and/or tree and fall shrub cover is extensive. Sometimes at toe of slope or edge of water body. An exit channel is usually present. Wetter than A1 and peat depth may be shallower (<2 m).	0	
		B. Moss and/or lichen cover less than 25% of the ground. Soil is mineral or decomposed organic (muck). Choose between B1 and B2 and mark the choice with a 1 in their adjoining column:		
		B1. Trees and shrubs taller than 1 m comprise more than 25% of the vegetated cover. Surface water is mostly absent or inundates the vegetation only seasonally (e.g., vernal pools or floodplain).	1	
		B2. Not B1. Tree & tall shrubs comprise less than than 25% of the vegetated cover. Vegetation is mostly herbaceous, e.g., cattail, bulrush, burreed, pond lily, horsetail. Surface water may be extensive and fluctuates seasonally, being either persistent or drying up partly or entirely.	0	
AA sh nclud ' adja lescn	ould also include part of it the open water part adj cent " is used synonymou bed features along their it	the AA should include all persistent waters in ponds smaller than 8 hectares (-283 m on a side) that are adjacent to the AA. The the water area of adjacent ponded water larger than 8 ha and adjacent rivers wider than 20 m. Specifically, the AA should jacent to wetland vegetation and equal in width to the average width of that vegetated zone. Throughout this data form, usly with abutting, adjoining, bordering, contiguous and means no upland (manmade or natural) completely separates the directly shared edge. Features joined only by a channel are not necessarily considered to be adjacent a large portion of their res do not have to be hydrologically connected in order to be considered adjacent.		
2	Wetland Types - Adjoining or Subordinate	If the AA is smaller than 1 ha, mark all other types that occupy more than 1% of the vegelated AA. If the AA is larger than 1 ha, mark all other types which are within or adjacent to the AA and occupy more than 1 ha, as visible from the AA or as interpreted from aerial imagery. Do not mark again the type marked in F1.		1 hectare is 10,000 sq. m or about 2.5 acres. It could have dimensions of 100 m by 100 m, 1000 m by 10 m, or similar. [AM, INV, SBM, WBF]
		A1. A2.	0	
		B1.	0	
		B2.	- 1	
3	Woody Height & Form Diversity	Following EACH row below, indicate with a number code the percentage of the living vegetation in the AA which is occupied by that feature (6 if >95%, 5 if 75-95%, 4 if 50-75%, 3 if 25-50%, 2 if 5-25%, 1 if <5%, 0 if none). If the vegetated part of the AA is largely herbaceous (non-woody) vegetation, these percentages should not sum to 100%.		Deciduous shrubs in this region usually include buttonbush, Labrador tea, bayberry (Morella), huckleberry, cranberry, cloudberry, sweetgale, alder, willow, birch, ash, dogwood, and a few others. If you assigned a code of 3 or higher to any of the first four choices and the ground cover beneath the trees/shrubs is <25% moss, then question F1 might be "B1". [CS, INV, NR, PH, POL, SBM, Sens]
		coniferous trees (may include tamarack) taller than 3 m. deciduous trees taller than 3 m.	5	
		coniferous or ericaceous shrubs or trees 1-3 m tall not directly below the canopy of trees.	1	
		deciduous shrubs or trees 1-3 m tall not directly below the canopy of trees. coniferous or ericaceous shrubs <1 m tall not directly below the canopy of taller vegetation.	2	
		deciduous shrubs or trees <1 m tall (e.g., deciduous seedlings) not directly below the canopy of taller vegetation.	2	
lote :	If none of top 4 rows in	F3 was marked 2 or greater , SKIP to F9 (N fixers).		
4	Dominance of Most	Determine which two woody plant species comprise the greatest portion of the low (<3 m) woody cover . Then choose one:		[PH, POL, SBM, Sens]
	Abundant Shrub Species	those species together comprise > 50% of such cover.	1	
5	Woody Diameter	those species together do not comprise > 50% of such cover. Mark ALL the types that comprise >5% of the woody canopy cover in the AA or >5% of the wooded areas (if any) along its upland edge	0	Estimate the diameters at chest height. If small-diameter trees are overtopped (shaded) by larger
	Classes	(perimeter). The edge should include only the trees whose canopies extend into the AA. coniferous, 1-9 cm diameter and >1 m tall.	1	ones, visualise a "subcanopy" at the average height of the smaller-dbh trees, to serve as a basis for t minimum 5% canopy requirement in this question. The trees and shrubs need not be wetland specie:

FieldF form - Non-tidal Page 3 of 5

F37	Interspersion of	During most of the part of the growing season when water is present, the spatial pattern of emergent vegetation within the water is mostly:		[AM, FA, FR, INV, NR, OE, PH, PR, SBM, SR, WBF, WBN]
	Emergents & Open Water	Scattered. More than 30% of such vegetation forms small islands or corridors surrounded by water.	0	
	water	Intermediate.	0	
		Clumped. More than 70% of such vegetation is in bands along the wetland perimeter or is clumped at one or a few sides of the surface water area.	0	
F38	Persistent Deepwater	If the deepest patch of surface water (flowing or ponded) in or directly adjacent to the AA is mostly deeper than 0.5 m for >2 weeks during the growing season, enter "1" and continue. If not, enter "0" and SKIP to F42 (Connection).	0	
F39	Area Non-vegetated Aquatic	During most of the growing season and in waters deeper than 0.5 m, the cover for fish, aquatic invertebrates, and/or amphibians that is		For this question, consider only the wood that is at or above the water surface. Estimates of underwater
	Cover	provided NOT by living vegetation, but by accumulations of dead wood and undercut banks is:		wood based only on observations from terrestrial viewpoints are unreliable so should not be attempted. [AM, FA, FR, INV]
		Little or none. Intermediate.	0	[Pag, 17, 115, 114]
E10		Extensive.	0	Survey
F40	Isolated Island	The AA contains (or is part of) an island or beaver lodge within a lake, pond, or river, and is isolated from the shore by water depths > 1 m on all sides during an average June. The island may be solid, or it may be a floating vegetation mat that is sufficiently large and dense to support a waterbird nest.	0	[WBN]
	Duckweed	At some time of the year, mats of algae and/or duckweed are likely to cover >50% of the AA's otherwise-unshaded water surface, or blanket >50% of the underwater substrate. If true, enter "1" in next column. If untrue or uncertain, enter "0".	0	[EC, PR, WBF]
F42	Channel Connection & Outflow Duration	The most persistent surface water connection (outlet channel or pipe, ditch, or overbank water exchange) between the AA and a downslope stream network is: [Note: If the AA represents only part of a welland, answer this according to whichever is the least permanent surface connection: the one between the AA and the rest of the wetland, or the surface connection between the wetland and the downslope stream network.] Persistent (surface water flows out for >9 months/year).	1	Consider the connection regardless of whether the surface water is frozen. The "downslope stream network" could consist of ditches, rivers, ponds, or lakes which eventually connect to the ocean. If this cannot be determined while visiting the AA, consult topographic maps perhaps by viewing these online with Toporama (http://atlas.nrcan.gc.ca/toporama/en/index.html) [CS, FA, FR, NR, OE, PR, Sens, SFS SR, WCv, WS]
		Seasonal (surface water flows out for 14 days to 9 months/year, not necessarily consecutive).	0	
		Temporary (surface water flows out for <14 days, not necessarily consecutive). None but maps show a stream network downslope from the AA and within a distance that is less than the AA's length. SKIP to F47 (pH	0	
		Measurement).		
		No surface water flows out of the wetland except possibly during extreme events (<once (ph="" 10="" a="" an="" dlich,="" f47="" flows="" into="" lacks="" lake="" measurement).<="" only="" or="" or,="" outlet.="" per="" skip="" td="" that="" to="" water="" wetland,="" years).=""><td>0</td><td></td></once>	0	
F43	Outflow Confinement	During major runoff events, in the places where surface water exits the AA or connected waters nearby, the water:		"Major runoff events" would include biennial high water caused by storms and/or rapid snowmelt. [CS, NR, OE, PR, Sens, SR, STR, WS]
		Mostly passes through a pipe, culvert, narrowly breached dike, berm, beaver dam, or other partial obstruction (other than natural topography) that does not appear to drain the wetland artificially during most of the growing season.	0	
		Leaves through natural exits (channels or diffuse outflow), not mainly through artificial or temporary features. Is exported more quickly than usual due to ditches or pipes within the AA or connected to its outlet, or within 10 m of the AA's edge, which	0	
F44	Tributary Channel	drain the wetland artificially, or water is pumped out of the AA. At least once annually, surface water from a tributary channel that is >100 m long moves into the AA. Or, surface water from a larger		If inlet tributaries cannot be searched for due to inaccessibility of part of the AA, follow suggestions in
	,	permanent water body adjacent to the AA spills into the AA. If it enters only via a pipe, that pipe must be fed by a mapped stream or lake further upslope. If no, SKIP to F47 (pH Measurement).	0	F42 above. [NRv, PH, PRv, SRv]
F45	Input Water Temperature	Based on lack of shade, water source characteristics, or actual temperature measurements, the inflow is likely to be warmer than surface water in the AA during part of most years. Enter 1= yes, 0= no.	0	[WCv]
F46	Throughflow Resistance	During its travel through the AA at the time of peak annual flow, water arriving in channels: [select only the ONE encountered by most of the incoming water].		[FA, FR, INV, NR, OE, PR, SR, WS]
	resistance	Does not bump into many plant stems as it travels through the AA. Nearly all the water continues to travel in unvegetated (often incised) channels that have minimal contact with wetland vegetation, or through a zone of open water such as an instream pond or lake.	0	
		Bumps into herbaceous vegetation but mostly remains in fairly straight channels.	0	
		Bumps into herbaceous vegetation and mostly spreads throughout, or is in widely meandering, multi-branched, or braided channels.	0	
		Bumps into tree trunks and/or shrub stems but mostly remains in fairly straight channels. Bumps into tree trunks and/or shrub stems and follows a fairly indirect path from entrance to exit (meandering, multi-branched, or braided).	0	
F47	pH Measurement	The pH in most of the AA's surface water:		Preferably, measure this in larger areas of ponded surface water within the AA, or in streams that have
		Was measured, and is: [enter the reading in the column to the right.]		passed through (not along) most of the AA. Unless surface water is completely absent, do not dig holes or make depressions in peat in order to provide water for this measurement. Avoid measuring near
		Was not measured but surface water is present and is darkly tea-coloured. Or if no surface water, then mosses and plants that indicate peatland (e.g., Labrador tea) are prevalent. Enter *11. Neither of above. Enter *17.	0	roads or in puddles formed only by recent rain. [AM, FA, FR, NR, WBF, PH, PR, Sens, WBF, WBN]
F48	TDS and/or	The TDS (total dissolved solids) or conductivity off the AA's surface water is: (select the first true row with information):		See above for measurement guidance. [FR, INV, NRv, PH, PRv, Sens]
	Conductivity	TDS is: [Enter the reading in ppm or mg/L. in the column to the right, if measured, or answer next row.] Conductivity is [Enter the reading in µS/cm in the column to the right.]		
		Was not measured, but plants that indicate saline conditions cover much of the vegetated AA. Enter *1*.	0	
F49	Beaver Probability	Neither of above Use of the AA by beaver during the past 5 years is (select most applicable ONE):	1	[FA, FR, PH, SBM, Sens, WBF, WBN]
1 47		Evident from direct observation or presence of gnawed limbs, dams, tracks, dens, lodges, or extensive stands of water-killed trees (snags).	0	[FA, FR, FR, SUID, WUF, WUN]
		Likely based on known occurrence in the region and proximity to suitable habitat, which may include: (a) a persistent freshwater wetland,	0	
		pond, or lake, or a perennial low or mid-gradient (<10%) channel, and (b) a corridor or multiple stands of hardwood trees and shrubs in vegetated areas near surface water.		
-		Unlikely because site characteristics above are deficient, and/or this is a settled area or other area where beaver are routinely removed.	1	
F50	Groundwater Strength of Evidence	Select first applicable choice: Springs are known to be present within the AA, or if groundwater levels have been monitored, that has demonstrated that groundwater primarily discharges to the wetland for longer periods during the year than periods when the wetland recharges the groundwater.	0	Adhere to these criteria strictly do not use personal judgment based on fen conditions, pH, or other evidence. Consult loggraphic maps to detect breaks in slope described here. Rust deposits associated with groundwater seeps may be most noticeable as orange discoloration in ice formations along streams during early winter. [AM, CS, FA, FR, INV, NR, OE, PH, PRV, SFS, WC, WS]
		Most of the AA has a slope of >5%, or is very close to the base of a natural slope longer than 100 and much steeper than the slope of the AA, AND the pH of surface water, if known, is >5.5.	0	and a second conditions to the condition of the condition
CC4	Internal Co. III	Neither of above is true, although some groundwater may discharge to or flow through the AA. Or groundwater influx is unknown.	1	This is not the contract of th
F51	Internal Gradient	The gradient along most of the flow path within the AA is:	1	This is not the same as the shoreline slope. It is the elevational difference between the AA's inlet and outlet, divided by the flow-distance between them and converted to percent. If available, use a
		<2% or the AA has no surface water outlet (not even seasonally). 2-5%.	0	clinometer to measure this. Free clinometer apps can be downloaded to smartphones. If the wetland is large (longer than -1 km), this may be estimated using Google Earth to determine the minimum and
		6-10%.	0	maximum elevation within the AA, then dividing by length and multiplying by 100. [CS, NR, OE, PR,
Note for	or the next three quest	>10%. ions: If the AA lacks an upland edge, evaluate based on the AA's entire perimeter, and moving outward into whatever areas are	0	SR, WBF, WBN, WS]
	nt. In many situations, th	nese questions are best answered by measuring from aerial images. Within a zone extending 30 m talerally from the AA's edge with upland and/or other wetlands, the percentage that contains perennial		[AM, FA, FR, INV, NRv, PH, POL, PRv, SBM, Sens, SRv, STR, WBN]

53	Type of Cover in Buffer	Within 30 m upslope of where the wetland transitions to upland, the upland land cover that is NOT perennial vegetation is mostly (mark ONE):		[AM, FA, INV, NRv, PH, POL, SBM, STR, WBN]
	Type or devel in Bullet	, , , , , , , , , , , , , , , , , , , ,		
		Impervious surface, e.g., paved road, parking lot, building, exposed rock.	0	
		Bare or nearly bare pervious surface or managed vegetation, e.g., lawn, row crops, unpaved road, dike, landslide.	1	
54	Buffer Slope	The steepest and/or most disturbed part of the upland area that is within 30 m of the welland and occupies >10% of that upland area has a percent slope of:		[NRv, PRv, Sens, SRv]
		<1% (flat almost no noticeable slope) or all the area within 30 m of the AA edge is other wetlands.	0	
		2-5%.	1	
		5-30%.	0	
	Cliffe an Chana Banda	>30%.	0	Danetin Indiana Indian
55	Cliffs or Steep Banks	In the AA or within 100 m, there are elevated terrestrial features such as cliffs, fatus slopes, stream banks, or excavated pits (but not riprap) that extend at least 2 m nearly vertically, are unvegetated, and potentially contain crevices or other substrate suitable for nesting or den areas. Enter 1 (yes) or 0 (no).	0	Do not include upturned trees as potential den sites. [POL, SBM]
56	New or Expanded Wetland	Human actions within or adjacent to the AA have persistently expanded a naturally occurring wetland or created a wetland where there previously was none (e.g., by excavation, impoundment):		Determine this using historical aerial photography, old maps, soil maps, or permit files as available [C NR, OE, PH, Sens]
		No.	1	
		Yes, and created or expanded 20 - 100 years ago.	0	
		Yes, and created or expanded 3-20 years ago.	0	
		Yes, and created or expanded within last 3 years.	0	
		Yes, but time of origin or expansion unknown.	0	
		Unknown if new or expanded within 20 years or not.	0	TO BUILDING TO BUI
57	Burn History	More than 1% of the AA's previously vegetated area:		Look for charred soil or stumps (in multiple widely-spaced locations) or ask landowner. [CS, PH, STR]
		Burned within past 5 years.	0	4
		Burned 6-10 years ago.	0	4
		Burned 11-30 years ago.	0	1
		Burned >30 years ago, or no evidence of a burn and no data.	1	(DLI CTD WOF)
58	Visibility	The maximum percentage of the wetland that is visible from the best vantage point on public roads, public parking lots, public buildings, or public maintained trails that intersect, adjoin, or are within 100 m of the AA (select one) is:		[PU, STR, WBFv]
		<25%.	1	
		25-50%.	0	
		>50%.	0	[DLL CTD]
59	Non-consumptive Uses - Actual or	Assuming access permission was granted, select ALL statements that are true of the AA as it currently exists:		[PU, STR]
	Potential	For an average person, walking is physically possible <u>in</u> (not just near) >5% of the AA during most of the growing season, e.g., free of deep water and dense shrub thickets.	1	
		water and derise struct mickets. Maintained roads, parking areas, or foot-trails are within 10 m of the AA, or the AA can be accessed part of the year by boats arriving via contiquous waters.	0	
		Within or near the AA, there is an interpretive center, trails with interpretive signs or brochures, and/or regular guided interpretive tours.	0	1
60	Unvisited Core Area	The percentage of the AA almost never visited by humans during an average growing season probably comprises: [Note: Only include the part actually walked or driven (not simply viewed from) with a vehicle or boat. Do not include visitors on traits outside of the AA unless more than half the wetland is visible from the traits and they are within 30 m of the wetland edge. In that case include only the area occupied by the		[AM, FAv, FRv, PH, PU, SBM, STR, WBF, WBN]
		trail.]		
		<5% and no inhabited building is within 100 m of the AA.	0	
		<5% and inhabited building is within 100 m of the AA.	0	4
		5-50% and no inhabited building is within 100 m of the AA. 5-50% and inhabited building is within 100 m of the AA.	0	4
		50-95%, with or without inhabited building nearby.	0	-
		>95% of the AA with or without inhabited building nearby.	1	
61	Frequently Visited	The part of the AA visited by humans almost daily for several weeks during an average growing season probably comprises: [See note	-	[AM, PH, PU, SBM, STR, WBF, WBN]
	Area	above.]	- 1	
		<5%. If F60 was answered ">95%" (mostly never visited), SKIP to F64. 5-50%.	0	
		50-95%.	0	-
		>95% of the AA.	0	1
62	BMP - Soils	Boardwalks, paved trails, fences or other infrastructure and/or well-enforced regulations appear to effectively prevent visitors from walking on soil within nearly all of the AA when the soil is unfrozen. Enter "1" if true.	0	[PH, PU]
63	BMP - Wildlife Protection	Fences, observation blinds, platforms, paved traits, exclusion periods, and/or well-enforced prohibitions on motorised boats, off-leash pets, and off road vehicles appear to effectively exclude or divert visitors and their pets from the AA at critical times in order to minimize disturbance of wildlife (except during hunting seasons). Enter *1* if true.	0	[AM, PU, WBF, WBN]
64	Consumptive Uses	Recent evidence was found within the AA of the following potentially-sustainable consumptive uses. Select ALL that apply.		[FAv, FRv, WBFv]
	(Provisioning Services)	Low-impact commercial timber harvest (e.g., selective thinning).	0	
		Commercial or traditional-use harvesting of native plants, their fruits, or mushrooms.	0	1
		Waterfowl hunting.	0	1
		Fishing.	0	1
		Trapping of furbearers.	0	1
		None of the above.	1	
65	Domestic Wells	The closest wells or water bodies that currently provide drinking water are:		[NRv]
		Within 0-100 m. of the AA.	0	1
		100-500 m. away.	0]
		>500 m. away, or no information.	1	
66	Calcareous Fen	The AA is, or is part of, a calcareous fen. See the Plants_Calcar worksheet in the accompanying Supplinfo file for list of plant indicators (calciphiles). Enter 1 If more than two Strong or more than five Moderate calciphile species are present; otherwise enter 0, but if not able to	0	[PH, PR]

Form F (Field). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Walk for no less than 10 minutes from the wetland edge towards its core, in the part of the AA that is proposed for alteration. If no alteration is proposed, walk in a portion that appears to be most representative of the wetland overall. Walk only where it is safe and legal to do so. Conduct the assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answer these questions primarily based on your onsite observations and interpretations. Do not write in shaded parts of this data form. Answering some questions accurately may require conferring with the landowner or other knowledgable persons and/or reviewing aerial imagery. For most wetlands, completing this field data form will require 1-2 hours on a site. For a list of functions to which each question pertains, see the accompanying Interpretations form. For detailed descriptions of each WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage & Delay, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity, STR= Stressors.

,,	to die	Condition of t	D. I	Definitions In 1 11
#	Indicators	Condition Choices	Data	Definitions/Explanations
1	Wetland Type	Follow the key below and mark the ONE row that best describes MOST of the vegetated part of the AA:		Ericaceous shrubs are ones in the heather family (Ericaceae). Most have leathery evergreen leaves. They include rhododendron, azalea, swamp laurel, leatherleaf, Labrador tea, and others. Most require
		A. Moss and/or lichen cover more than 25% of the ground. Often dominated by ericaceous shrubs (e.g., Labrador tea) or other acid-tolerant plants (e.g., bog cranberry, pitcher plant, sundew, orchids). Substrate is mostly undecomposed peat. Choose between A1 and A2 and mark the choice with a 1 in their adjoining column. Otherwise go to B below.		acidic soil. Although not in the family Ericaceae, sweetgale (<i>Myrica gale</i>) should be counted also. [AM, CS, FA, FR, INV, NR, OE, PH, Sens, SFS, WBF, WBN]
		A1. Surface water is usually absent or, if present, pH is typically <4.5 and conductivity is usually <100 µS/cm (<64 ppm TDS). Trees are absent or nearly so. Sedge cover usually sparse or absent but cottongrass and/or lichen cover may be extensive, as well as cloudberry, lingonberry, sheep laurel, and a sedge (Carex rariflora). Welfand surface and surrounding landscape are seldom sloping and welfand often is domed (convex). Inlet and outlet channels are usually absent. If known, pH of peat is <4.0.	0	
		A2. Not A1. Surface water, if present, has pH typically >4.5 and conductivity is usually >100 µS/cm (>64 ppm TDS). Sedge cover is usually extensive, and/or tree and fall shrub cover is extensive. Sometimes at toe of slope or edge of water body. An exit channel is usually present. Wetter than A1 and peat depth may be shallower (<2 m).	0	
		B. Moss and/or lichen cover less than 25% of the ground. Soil is mineral or decomposed organic (muck). Choose between B1 and B2 and mark the choice with a 1 in their adjoining column:		
		B1. Trees and shrubs taller than 1 m comprise more than 25% of the vegetated cover. Surface water is mostly absent or inundates the vegetation only seasonally (e.g., vernal pools or floodplain).	1	
		B2. Not B1. Tree & tall shrubs comprise less than than 25% of the vegetated cover. Vegetation is mostly herbaceous, e.g., cattail, bulrush, burreed, pond lily, horsetail. Surface water may be extensive and fluctuates seasonally, being either persistent or drying up partly or entirely.	0	
AA sh nclud ' adja lescn	ould also include part of t e the open water part adj cent " is used synonymou bed features along their o	the AA should include all persistent waters in ponds smaller than 8 hectares (-283 m on a side) that are adjacent to the AA. The the water area of adjacent ponded water larger than 8 ha and adjacent rivers wider than 20 m. Specifically, the AA should [acent to wetland vegetation and equal in width to the average width of that vegetated zone. Throughout this data form, usly with abutting, adjoining, bordering, contiguous and means no upland (manmade or natural) completely separates the directly shared edge. Features joined only by a channel are not necessarily considered to be adjacent a large portion of their res do not have to be hydrologically connected in order to be considered adjacent.		
2	Wetland Types - Adjoining or Subordinate	If the AA is smaller than 1 ha, mark all other types that occupy more than 1% of the vegetated AA. If the AA is larger than 1 ha, mark all other types which are within or adjacent to the AA and occupy more than 1 ha, as visible from the AA or as interpreted from aerial imagery. Do not mark again the type marked in F1.		1 hectare is 10,000 sq. m or about 2.5 acres. It could have dimensions of 100 m by 100 m, 1000 m by 10 m, or similar. [AM, INV, SBM, WBF]
		A1. A2.	0	
		B1.	0	
		B2.	- 1	
3	Woody Height & Form Diversity	Following EACH row below, indicate with a number code the percentage of the living vegetation in the AA which is occupied by that feature (6 if -95%, 5 if 75-95%, 4 if 50-75%, 3 if 25-50%, 2 if 5-25%, 1 if -45%, 0 if none). If the vegetated part of the AA is largely herbaceous (non-woody) vegetation, these percentages should not sum to 100%.		Deciduous shrubs in this region usually include buttonbush, Labrador tea, bayberry (Morella), huckleberry, cranberry, cloudberry, sweetgale, alder, willow, birch, ash, dogwood, and a few others. If you assigned a code of 3 or higher to any of the first four choices and the ground cover beneath the trees/shrubs is <25% moss, then question F1 might be "B1". [CS, INV, NR, PH, POL, SBM, Sens]
		coniferous trees (may include tamarack) taller than 3 m. deciduous trees taller than 3 m.	5	
		coniferous or ericaceous shrubs or trees 1-3 m tall not directly below the canopy of trees.	1	
		deciduous shrubs or trees 1-3 m tall not directly below the canopy of trees. coniferous or ericaceous shrubs <1 m tall not directly below the canopy of taller vegetation.	2	
		deciduous shrubs or trees <1 m tall (e.g., deciduous seedlings) not directly below the canopy of taller vegetation.	2	
lote :	If none of top 4 rows in	F3 was marked 2 or greater , SKIP to F9 (N fixers).		
4	Dominance of Most	Determine which two woody plant species comprise the greatest portion of the low (<3 m) woody cover . Then choose one:		[PH, POL, SBM, Sens]
	Abundant Shrub Species	those species together comprise > 50% of such cover.	1	
5	Woody Diameter	those species together do not comprise > 50% of such cover. Mark ALL the types that comprise >5% of the woody canopy cover in the AA or >5% of the wooded areas (if any) along its upland edge	0	Estimate the diameters at chest height. If small-diameter trees are overtopped (shaded) by larger
	Classes	(perimeter). The edge should include only the trees whose canopies extend into the AA. coniferous, 1-9 cm diameter and >1 m tall.	1	ones, visualise a "subcanopy" at the average height of the smaller-dbh trees, to serve as a basis for t minimum 5% canopy requirement in this question. The trees and shrubs need not be wetland species
		broad-leaved deciduous 1-9 cm diameter and >1 m tall.	1	[AM, CS, POL, SBM, Sens, WBN]
		coniferous, 10-19 cm diameter.	1	
		broad-leaved deciduous 10-19 cm diameter. coniferous, 20-40 cm diameter.	1	
		broad-leaved deciduous 20-40 cm diameter.	1	
		coniferous, >40 cm diameter.	1	
- 2	Height Class	broad-leaved deciduous >40 cm diameter. Follow the key below and mark the ONE row that best describes MOST of the AA:	0	[AM, INV, NR, PH, SBM, Sens]
6	Interspersion	A. Neither the vegetation taller than 1 m nor the vegetation shorter than that comprise >70% of the vegetated part of the AA. They each comprise 30-70%. Choose between A1 and A2 and mark the choice with a 1 in the adjoining column. Otherwise go to B below.		
6				
6		A1. The two height classes are mostly scattered and intermixed throughout the AA.	0	
6		A2. Not A1. The two height classes are mostly in separate zones or bands, or in proportionately large clumps.	0	
6				
6		A2. Not A1. The two height classes are mostly in separate zones or bands, or in proportionately large clumps. B. Either the vegetation shorter than 1 m comprises > 70% of the vegetated part of the AA, or the vegetation taller than that does. One size class might even be lotally absent. Choose between B1 and B2 and mark the choice with a 1 in the adjoining column: B1. The less prevalent height class is mostly scattered and intermixed within the prevalent one, in separate zones or clumps, or is completely. B2. Not B1. The less prevalent height class is mostly located apart from the prevalent one, in separate zones or clumps, or is completely.		
7	Large Snags (Dead	A2. Not A1. The two height classes are mostly in separate zones or bands, or in proportionately large clumps. B. Either the vegetation shorter than 1 m comprises >70% of the vegetated part of the AA, or the vegetation taller than that does. One size class might even be totally absent. Choose between B1 and B2 and mark the choice with a 1 in the adjoining column: B1. The less prevalent height class is mostly scattered and intermixed within the prevalent one.	0	
7	Large Snags (Dead Standing Trees)	A2. Not A1. The two height classes are mostly in separate zones or bands, or in proportionately large clumps. B. Either the vegetation shorter than 1 m comprises > 70% of the vegetated part of the AA, or the vegetation taller than that does. One size class might even be totally absent. Choose between B1 and B2 and mark the choice with a 1 in the adjoining column: B1. The less prevalent height class is mostly scattered and intermixed within the prevalent one. B2. Not B1. The less prevalent height class is mostly located apart from the prevalent one, in separate zones or clumps, or is completely absent. The number of large snags (diameter >20 cm) in the AA plus adjacent upland area within 10 m of the wetland edge is: None, or fewer than 8/ hectare which exceed this diameter.	0 0	Snags are dead standling trees that often (not always) lack bark and foliage. Include only ones that at at least 2 m tall. [POL, SBM, WBN]
77		A2. Not A1. The two height classes are mostly in separate zones or bands, or in proportionately large clumps. B. Either the vegetation shorter than 1 m comprises >70% of the vegetated part of the AA, or the vegetation taller than that does. One size class might even be totally absort. Choose between B1 and B2 and mark the choice with a 1 in the adjoining column: B1. The less prevalent height class is mostly scattered and intermixed within the prevalent one. B2. Not B1. The less prevalent height class is mostly located apart from the prevalent one, in separate zones or clumps, or is completely—absent. The number of large snags (diameter >20 cm) in the AA plus adjacent upland area within 10 m of the welland edge is: None, or fewer than 8/ hectare which exceed this diameter. Several (>8/hectare) and a pond, lake, or slow-flowing water wider than 10 m is within 1 km.	0 0	
7		A2. Not A1. The two height classes are mostly in separate zones or bands, or in proportionately large clumps. B. Either the vegetation shorter than 1 m comprises > 70% of the vegetated part of the AA, or the vegetation taller than that does. One size class might even be totally absent. Choose between B1 and B2 and mark the choice with a 1 in the adjoining column: B1. The less prevalent height class is mostly scattered and intermixed within the prevalent one. B2. Not B1. The less prevalent height class is mostly located apart from the prevalent one, in separate zones or clumps, or is completely absent. The number of large snags (diameter >20 cm) in the AA plus adjacent upland area within 10 m of the wetland edge is: None, or fewer than 8/ hectare which exceed this diameter.	0 0	
7	Standing Trees)	A2. Not A1. The two height classes are mostly in separate zones or bands, or in proportionately large clumps. B. Either the vegetation shorter than 1 m comprises >70% of the vegetated part of the AA, or the vegetation taller than that does. One size class might even be lotally absent. Choose between B1 and B2 and mark the choice with a 1 in the adjoining column: B1. The less prevalent height class is mostly scattered and intermixed within the prevalent one. B2. Not B1. The less prevalent height class is mostly located apart from the prevalent one, in separate zones or clumps, or is completely absent. The number of large snags (diameter >20 cm) in the AA plus adjacent upland area within 10 m of the wetland edge is: None, or fewer than 8/ hectare which exceed this diameter. Several (>80hectare) and a pond, take, or slow-flowing water wider than 10 m is within 1 km. Several (>80hectare) but above not true.	0 0

	Cover	provided NOT by living vegetation, but by accumulations of dead wood and undercut banks is:		wood based only on observations from terrestrial viewpoints are unreliable so should not be attempted. [AM, FA, FR, INV]
		Little or none. Intermediate.	0	[Pag, 17, 115, 114]
E10		Extensive.	0	Survey
F40	Isolated Island	The AA contains (or is part of) an island or beaver lodge within a lake, pond, or river, and is isolated from the shore by water depths > 1 m on all sides during an average June. The island may be solid, or it may be a floating vegetation mat that is sufficiently large and dense to support a waterbird nest.	0	[WBN]
	Duckweed	At some time of the year, mats of algae and/or duckweed are likely to cover >50% of the AA's otherwise-unshaded water surface, or blanket >50% of the underwater substrate. If true, enter "1" in next column. If untrue or uncertain, enter "0".	0	[EC, PR, WBF]
F42	Channel Connection & Outflow Duration	The most persistent surface water connection (outlet channel or pipe, ditch, or overbank water exchange) between the AA and a downslope stream network is: [Note: If the AA represents only part of a welland, answer this according to whichever is the least permanent surface connection: the one between the AA and the rest of the wetland, or the surface connection between the wetland and the downslope stream network.] Persistent (surface water flows out for >9 months/year).	1	Consider the connection regardless of whether the surface water is frozen. The "downslope stream network" could consist of ditches, rivers, ponds, or lakes which eventually connect to the ocean. If this cannot be determined while visiting the AA, consult topographic maps perhaps by viewing these online with Toporama (http://atlas.nrcan.gc.ca/toporama/en/index.html) [CS, FA, FR, NR, OE, PR, Sens, SFS SR, WCv, WS]
		Seasonal (surface water flows out for 14 days to 9 months/year, not necessarily consecutive).	0	
		Temporary (surface water flows out for <14 days, not necessarily consecutive). None but maps show a stream network downslope from the AA and within a distance that is less than the AA's length. SKIP to F47 (pH	0	
		Measurement).		
		No surface water flows out of the wetland except possibly during extreme events (<once (ph="" 10="" a="" an="" dlich,="" f47="" flows="" into="" lacks="" lake="" measurement).<="" only="" or="" or,="" outlet.="" per="" skip="" td="" that="" to="" water="" wetland,="" years).=""><td>0</td><td></td></once>	0	
F43	Outflow Confinement	During major runoff events, in the places where surface water exits the AA or connected waters nearby, the water:		"Major runoff events" would include biennial high water caused by storms and/or rapid snowmelt. [CS, NR, OE, PR, Sens, SR, STR, WS]
		Mostly passes through a pipe, culvert, narrowly breached dike, berm, beaver dam, or other partial obstruction (other than natural topography) that does not appear to drain the wetland artificially during most of the growing season.	0	
		Leaves through natural exits (channels or diffuse outflow), not mainly through artificial or temporary features. Is exported more quickly than usual due to ditches or pipes within the AA or connected to its outlet, or within 10 m of the AA's edge, which	0	
F44	Tributary Channel	drain the wetland artificially, or water is pumped out of the AA. At least once annually, surface water from a tributary channel that is >100 m long moves into the AA. Or, surface water from a larger		If inlet tributaries cannot be searched for due to inaccessibility of part of the AA, follow suggestions in
	,	permanent water body adjacent to the AA spills into the AA. If it enters only via a pipe, that pipe must be fed by a mapped stream or lake further upslope. If no, SKIP to F47 (pH Measurement).	0	F42 above. [NRv, PH, PRv, SRv]
F45	Input Water Temperature	Based on lack of shade, water source characteristics, or actual temperature measurements, the inflow is likely to be warmer than surface water in the AA during part of most years. Enter 1= yes, 0= no.	0	[WCv]
F46	Throughflow Resistance	During its travel through the AA at the time of peak annual flow, water arriving in channels: [select only the ONE encountered by most of the incoming water].		[FA, FR, INV, NR, OE, PR, SR, WS]
	resistance	Does not bump into many plant stems as it travels through the AA. Nearly all the water continues to travel in unvegetated (often incised) channels that have minimal contact with wetland vegetation, or through a zone of open water such as an instream pond or lake.	0	
		Bumps into herbaceous vegetation but mostly remains in fairly straight channels.	0	
		Bumps into herbaceous vegetation and mostly spreads throughout, or is in widely meandering, multi-branched, or braided channels.	0	
		Bumps into tree trunks and/or shrub stems but mostly remains in fairly straight channels. Bumps into tree trunks and/or shrub stems and follows a fairly indirect path from entrance to exit (meandering, multi-branched, or braided).	0	
F47	pH Measurement	The pH in most of the AA's surface water:		Preferably, measure this in larger areas of ponded surface water within the AA, or in streams that have
		Was measured, and is: [enter the reading in the column to the right.]		passed through (not along) most of the AA. Unless surface water is completely absent, do not dig holes or make depressions in peat in order to provide water for this measurement. Avoid measuring near
		Was not measured but surface water is present and is darkly tea-coloured. Or if no surface water, then mosses and plants that indicate peatland (e.g., Labrador tea) are prevalent. Enter *11. Neither of above. Enter *17.	0	roads or in puddles formed only by recent rain. [AM, FA, FR, NR, WBF, PH, PR, Sens, WBF, WBN]
F48	TDS and/or	The TDS (total dissolved solids) or conductivity off the AA's surface water is: (select the first true row with information):		See above for measurement guidance. [FR, INV, NRv, PH, PRv, Sens]
	Conductivity	TDS is: [Enter the reading in ppm or mg/L. in the column to the right, if measured, or answer next row.] Conductivity is [Enter the reading in µS/cm in the column to the right.]		
		Was not measured, but plants that indicate saline conditions cover much of the vegetated AA. Enter *1*.	0	
F49	Beaver Probability	Neither of above Use of the AA by beaver during the past 5 years is (select most applicable ONE):	1	[FA, FR, PH, SBM, Sens, WBF, WBN]
1 47		Evident from direct observation or presence of gnawed limbs, dams, tracks, dens, lodges, or extensive stands of water-killed trees (snags).	0	[FA, FR, FR, SUID, WUF, WUN]
		Likely based on known occurrence in the region and proximity to suitable habitat, which may include: (a) a persistent freshwater wetland,	0	
		pond, or lake, or a perennial low or mid-gradient (<10%) channel, and (b) a corridor or multiple stands of hardwood trees and shrubs in vegetated areas near surface water.		
-		Unlikely because site characteristics above are deficient, and/or this is a settled area or other area where beaver are routinely removed.	1	
F50	Groundwater Strength of Evidence	Select first applicable choice: Springs are known to be present within the AA, or if groundwater levels have been monitored, that has demonstrated that groundwater primarily discharges to the wetland for longer periods during the year than periods when the wetland recharges the groundwater.	0	Adhere to these criteria strictly do not use personal judgment based on fen conditions, pH, or other evidence. Consult loggraphic maps to detect breaks in slope described here. Rust deposits associated with groundwater seeps may be most noticeable as orange discoloration in ice formations along streams during early winter. [AM, CS, FA, FR, INV, NR, CB, PH, PRV, SFS, WC, WS]
		Most of the AA has a slope of >5%, or is very close to the base of a natural slope longer than 100 and much steeper than the slope of the AA, AND the pH of surface water, if known, is >5.5.	0	and a second conditions to the condition of the condition
CC4	Internal Co. III	Neither of above is true, although some groundwater may discharge to or flow through the AA. Or groundwater influx is unknown.	1	This is not the control of the contr
F51	Internal Gradient	The gradient along most of the flow path within the AA is:	1	This is not the same as the shoreline slope. It is the elevational difference between the AA's inlet and outlet, divided by the flow-distance between them and converted to percent. If available, use a

Waterbird Feeding Habitat (WBF)	0.00	Lower	0.00	Lower	0.00	0.00
Waterbird Nesting Habitat (WBN)	0.00	Lower	0.00	Lower	0.00	0.00
Songbird, Raptor, & Mammal Habitat (SBM)	6.27	Moderate	2.50	Lower	5.20	2.50
Pollinator Habitat (POL)	9.62	Higher	0.00	Lower	7.75	0.00
Native Plant Habitat (PH)	5.27	Moderate	4.97	Moderate	5.21	4.32
Public Use & Recognition (PU)			2.26	Lower		1.94
Wetland Sensitivity (Sens)			0.00	Lower		2.12
Wetland Ecological Condition (EC)			4.70	Moderate		6.94
Wetland Stressors (STR) (higher score means more stress)			1.92	Lower		2.97
Summary Ratings for Grouped Functions:						
HYDROLOGIC Group (WS)	5.63	Higher	1.63	Lower	5.08	1.70
WATER QUALITY SUPPORT Group (max+avg/2 of SR, PR, NR, CS)	6.21	Higher	1.49	Lower	7.59	2.09
AQUATIC SUPPORT Group (max+avg/2 of SFS, INV, OE, WC)	4.72	Moderate	5.07	Higher	4.43	3.16
AQUATIC HABITAT Group (max+avg/2 of FA, FR, AM, WBF, WBN)	1.88	Lower	0.47	Lower	2.97	1.54
TRANSITION HABITAT Group (max+avg/2 of SBM, PH, POL)	8.33	Higher	3.73	Moderate	6.90	3.29
WETLAND CONDITION (EC)			4.70	Moderate		6.94
WETLAND RISK (average of Sensitivity & Stressors)			0.96	Lower		2.54
	NOTE A				1 15 1	

NOTE: A score of 0 does not mean the function or benefit is absent from the wetland. It means only that this wetland has a capacity that is equal or less than the lowest-scoring one, for that function or benefit, from among the 98 NB calibration wetlands that were assessed previously.

Cover Page: Basic Description of Assessment	WESP-AC version 2
Site Name:	Burchill Wind Energy Project - MC-W-01
Investigator Name:	Derrick Mitchell
Date of Field Assessment:	October 9, 2019
	Lorneville (west Saint John), New Brunswick
Latitude (decimal degrees):	45.188198
Longitude (decimal degrees):	-66.187343
Is a map based on a formal on-site wetland delineation available?	
Approximate size of the Assessment Area (AA, in hectares):	8.9 ha
AA as percent of entire wetland (approx.). Attach sketch map if AA is smaller than the entire contiguous wetland.	90
What percent (approx.) of the wetland were you able to visit?	90
What percent (approx.) of the AA were you able to visit?	
Were you able to ask the site owner/manager about any of the questions?	
Indicate here if you intentionally surveyed for rare plants, calciphile plants, or rare animals	
Have you attended a WESP-AC training session? If so, indicate approximate month & year	
How many wetlands have you assessed previously using WESP-AC? (approx.)	
Comments about the site or this WESP-AC assessment (attach extra page if desired):	

Form OF (Office). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Conduct an assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answering many of the questions below will equire using these online map viewers:

Google Earth Pro: https://www.google.com/earth/download/gep/agree.html

GeoNB: http://www.snb.ca/geonb1/ and http://www.snb.ca/geonb1/e/apps/apps-E.asp

Geons: http://www.snb.ca/geonol/ and http://www.snb.ca/geonol/e/apps/apps/apps-e.asp
For most wetlands, completing this office data form will require 1-2 hours. For a list of functions to which each question pertains, see bracketed abbreviations in the Definitions/Explanations column. For detailed descriptions of each
WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus
Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding
Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity, STR= Stressors.

#	Indicators	Condition Choices	Data	Definitions/Explanations	
DF1	Province	Mark the province in which the AA is located by changing the 0 in the column next to it to a "1". Mark only one.		This determines to which province's calibration wetlands the raw score of any wetland is normalised. In the function and benefits models, it also triggers the automatic exclusion of indicators for which no	
		New Brunswick	1	spatial data exists in a particular province.	
		Nova Scotia	0		
		Prince Edward Island	0		
		Newfoundland-Labrador	0		
DF2	Ponded Area Within 1 km.	The area of surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) within 1 km is:		"Adjacent" means not separated from the AA by a wide expanse (>50 m) of upland (including roads >50 m wide). Include ponded areas likely to be hidden by wetland vegetation. If surface water	
		<0.01 hectare (about 10 m x 10 m).	0	extends beyond 1 km, include only the part within 1 km. Do not include tidal areas. Measure the ar from aerial imagery using Google Earth Pro (click on Ruler icon in toolbar, then Polygon in pop-up	
		0.01 - 0.1 hectare.	0	menu). With the GeoNB viewer, enable the Wetlands layer, then measure with the Draw & Measure	
		0.1 - 1 hectare.	0	tool after specifying Aerial as the Basemap. However, do not rely entirely on wetland boundaries	
		1 to 10 hectares.	1	shown in online wetlands layers. [PH, SBM, WBN]	
		10 to 100 hectares. >100 hectares.	0		
)F3	Ponded Water &	The area of wetlands and surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) within		See definition of adjacent in OF2. If the AA's wetland vegetation extends beyond 1 km, include only	
,, ,	Wetland Within 1 km.	1 km is:		the part within 1 km. "Ponded" means not flowing in rivers or streams. [Sens, WBF]	
		<0.01 hectare (about 10 m x 10 m).	0		
		0.01 - 0.1 hectare. 0.1 - 1 hectare.	0	1	
		1 to 10 hectares.	0	1	
		10 to 100 hectares.	0	1	
		>100 hectares.	1		
)F4	Size of Largest Nearby	The largest vegetated patch or corridor that includes the AA's vegetation plus aladjacent upland vegetation that is not lawn, row crops,		See definition of adjacent in OF2. Use Google Earth Pro's polygon ruler (as described above).	
	Vegetated Tract or Corridor	heavily grazed lands, conifer plantation is:		Exclude confer plantations only if it is obvious that trees were planted in rows. [AM, PH, SBM, Sens	
		<0.01 hectare (about 10 m x 10 m).	0		
		0.01 - 0.1 hectare.	0		
		0.1 - 1 hectare.	0	4	
		1 to 10 hectares. 10 to 100 hectares.	0	4	
		10 to 100 hectares. 100 to 1000 hectares.	0	1	
		>1000 hectares. [This is nearly always the answer in relatively undeveloped landscapes]	1		
DF5	Distance to Large Vegetated Tract	Proton rectains: [rms is nearly aways we ariswe in realised in realised and countries and countries are supported in the minimum distance from theedge of the AA to the edge of the closest vegetated land (but excluding row crops, lawn, conifer plantation) larger than 375 hectares (about 2 km on a side), is:		To measure distance, use Google Earth Pro (Ruler > Line tool). Or use Draw & Measure tool at GeoNB. The 375-ha criterion is from the Fundy Model Forest Project. [AM, PH, POL, SBM, Sens]	
	regulated max	-50 m, and not separated from the 375-ha vegetated area by any width opaved roads, stretches of open water, row crops, bare ground, lawn, or impervious surface. Or the AAI itself contains -3375 ha of vegetation. [This is often the answer in relatively undeveloped landscape	1	Country to the district of the state of the	
		<50 m, but completely separated from the 375-ha vegetated area by those features, and AA does not contain >375 ha of vegetation.	0		
		50-500 m, and not separated.	0	1	
		50-500 m, but separated by those features.	0	1	
		0.5 - 5 km, and not separated.	0	1	
		0.5 - 5 km, but separated by those features.	0	1	
		None of the above (the closest patches or corridors which are that large are >5 km away).	0	1	
DF6	Herbaceous Uniqueness	The AA's vegetation cover is >10% herbaceous* but uplands within 5 km have <10% herbaceous cover. If so, enter "3" and continue to OFT. If not, consider: The AA's vegetation cover is >10% herbaceous* but uplands within 1 km have <10% herbaceous cover. If so enter "2" and continue to OFT. If not, consider:	0	For this question only, consider moss to be herbaceous vegetalion. Determine the score by viewing aerial imagery in Google Earth after successively drawing or estimating the boundaries of the buffer of 5 km, 1 km, and 100 m radius focused on the center of the AA. Circles of specified radius can be drawn in Google Earth Pro by clicking on the Ruler icon, then Circle in the pop-up menu. [AMN, PHA	
		The AA's vegetation cover is >10% herbaceous* but uplands within 100 m of the wetland edge have <10% herbaceous cover. If so, enter " " NOTE: Exclude lawns, row crops, heavily grazed lands, forest, shrublands. Include moss as well as grasslike plants in this use of "herbaceous vegetation"	r	POLv, SBMv, WBFv, WBNv)	
DF7	Woody Uniqueness	The AA's vegetation cover is >10% woody" but uplands within 5 km have <10% woody cover. If so, enter "3" and continue to OF8. If not, consider:	0	See above. Do not consider conifer plantations to be forest if it is obvious that trees were planted in fows. [AMv, PHv, POLv, SBMv]	
		The AA's vegetation is >10% woody' but uplands within 1 km have <10% woody cover. If so enter "2" and continue to OF8. If not, consider: The AA's vegetation is >10% woody' but uplands within 100 m of the wetland edge have <10% woody cover. If so, enter "1"			
)F8	Local Vogotated Cover	[* NOTE: woody cover = trees & shrubs taller than 1 m.]		In Condis Earth, draw the Elim buffer and then estimate land cover personages, or do CIS analysis	
JFδ	Local Vegetated Cover Percentage	Draw a 5-km radius circle measured from the center of the AA. Ignoring all permanent water in the circle, the percent of the remaining are that is wooded or unmanaged herbaceous vegetation (NOT lawn, row crops, bare or heavily grazed land, clearcuts, or conifer plantations) is:		In Google Earth, draw the 5 km buffer and then estimate land cover percentages, or do GIS analysis of an appropriate land cover layer. [AM, PH, POL, SBM, Sens]	
		<5% of the land.	0	-	
		5 to 20% of the land.	0	-	
		20 to 60% of the land.	0	-	
		60 to 90% of the land.	0		
)F9	Type of Land Cover	>90% of the land. SKIP to OF10. Within the 5-km radius circle, and ignoring all permanent water, the land area that is bare or non-perennial cover is mostly:		[AM, SBM]	
JI 7	Alteration			[run, John]	
		Impervious surface, e.g., paved road, parking lot, building, exposed rock.	0	1	
		Bare pervious surface, e.g., lawn, recent (<5 yrs ago) clearcut, dirt or gravel road, cropland, landslide, conifer plantation.	0		
	Distance by Road to	Measured along the maintained road nearest the AA, the distance to the neares population center is:		"Population center" means a settled area with more than about 5 regularly- inhabited structures per square kilometer. In Google Earth, click on the Ruler icon, then Path, and draw and measure the	
)F10	Nearest Population	<100 m.	0	square kilometer. In Google Earth, click on the Ruler Icon, then Path, and draw and measure the route. Or use the GeoNB's Draw & Measure tool> Freehand Line to draw and measure the route to	
)F10	Center				
)F10	Center	100 - 500 m.	0	Settlements (click on Place Names in menu) or other areas not close to mapped settlements but	
OF10	Center	100 - 500 m. 0.5- 1 km.	0	Settlements (click on Place Names in menu) or other areas not close to mapped settlements but which meet the criteria.[FAv, FRv, NRv, PH, PU, SBM, WBFv]	
)F10	Center				

OF11	Distance to Nearest	From the center of the AA, the distance to the nearest maintained public road (dirt or paved) is:		Determine this by viewing aerial imagery in Google Earth and measuring with the Ruler>Line tool. Or
	Maintained Road	<10 m.	0	use the GeoNB's Draw Line tool. [AM, FAv, FRv, NRv, PH, PU, SBM, STR, WBN]
		10 - 25 m.	0	
		25 - 50 m.	0	
		50 - 100 m. 100 - 500 m.	0	
		>500 m.	0	
OF12	Wildlife Access	Draw a circle of radius of 5 km from the center of the AA. If mammals and amphibians can move from the center of the AA to ALL other separate wetlands and ponds located within the circle without being forced to cross pavement (any width), lawns, bare ground, and/or marine waters, mark 1 = yes can move to all, 0 = no. Change toblank if there are no other wetlands within 5 km.	0	In NB, enable the Wetlands layer in GeoNB (despile ils omissions) to show surrounding wetlands and roads, while estimating the location of the 5 km circle (or draw the 5 km circle in Google Earth Pro using the Circle tool and compare). Evaluate using Google Earth, being cautious to search for roads
				hidden under forest canopy. [AM, SBM, STR]
OF13	Distance to Ponded Water	The distance from the AA center to the closest (but separate) ponded water body visible in GoogleEarth imagery is:		In Google Earth, zoom in closely to examine the surrounding landscape for ponds, lakes, and wetlands that appear to be permanently flooded. Enable the GeoNB viewer's Wetlands layer as well
	· · · · · · · · · · · · · · · · · · ·	450 m, and not separated by any width of paved roads, stretches of open water, row crops, lawn, bare ground, or impervious surface.	0	[AM, PH, SBM, Sens, WBF, WBN]
		<50 m, but completely separated by those features. 50-500 m, and not separated.	0	
		50-500 m, but separated by those features.	0	
		0.5 - 1 km, and not separated.	- 1	
		0.5 - 1 km, but separated by those features.	0	
0544	D	None of the above (the closest patches or corridors that large are >1 km away).	0	D
OF14	Distance to Large Ponded Water	The distance from the AA center to the closest (but separate)non-tidal body of water that is ponded during most of the year and islarger than 8 hectares during most of a normal year is: -100 m.	0	Determine this by viewing aerial imagery in Google Earth. [Sens, WBF, WBN]
		100 m · 1 km.	0	
		1 - 2 km.	0	
		2-5 km.	1	
		5-10 km.	0	
		>10 km.	0	
OF15	Tidal Proximity	The distance from the AA edge to the closesttidal water body (regardless of its salinity) is:		In Google Earth, measure the distance to the ocean (including Bay of Fundy) or tidal river, whichever is closer. If you need to see how far upriver a river is tidal, see the KMZ file provided with this
		<100 m.	0	calculator for NB (NB Headtide). Points shown in those files are only an approximation, so local
		100 m - 1 km.	0	information if available may be preferable. [FA, WBF]
		1 - 5 km.	1	
		5-10 km. 10-40 km.	0	
		>40 km.	0	
OF16	Upland Edge Contact	Select one:		[NR, SBM, Sens]
		The AA has no upland edge (or upland is <1% of perimeter). The AA is entirely surrounded by (& contiguous with) other wetlands or water	. 0	
		1-25% of the AA's perimeter abuts upland (including filled areas). The rest adjoins other wetlands or water that is mostly wider than the AA	0	
		25-50% of the AA's perimeter abuts upland. The rest adjoins other wetlands or water that is mostly wider than the AA.	0	
		50-75% of the AA's perimeter abuts upland. The rest adjoins other wetlands or water that is mostly wider than the AA.	0	
		More than 75% of the AA's perimeter abuts upland. Any remainder adjoins other wetlands or water that is mostly wider than the AA.This will be true for most assessments done with WESP-AC.	1	
OF17	Flood Damage from Non-			In the GeoNB map viewer: click on "More" in upper right, then "Flood Information". Expand the menu
	tidal Waters	Maps show Flood Zone or Flood Risk areas and there appears to be infrastructure vulnerable to river flooding not caused by tidal storm surges.	0	under it by clicking on the arrow to its left and the slider to its right. Uncheck the first (Limits of Data) box. Where available, LiDAR imagery can provide finer elevational resolution useful for flood
		longuis. Maps show Flood Zone or Flood Risk areas, but infrastructure is absent or is not vulnerable to floods from a non-tidal river. In some cases levees, upriver dams, or other measures may partly limit damage or risk from smaller events.	0	modeling. [WSv]
		Maps do not show Flood Zone or Flood Risk areas (or no such mapping has been done locally) and there appears to be infrastructure vulnerable to river flooding unrelated to tidal storm surges.	0	
		Maps do not show Flood Zone or Flood Risk areas (or no such mapping has been done locally) and there ino infrastructure vulnerable to river flooding unrelated to tidal storm surges.	1	
OF18	Relative Elevation in Watershed	In Google Earth, enable the Terrain layer (lower left menu) and open the NB_Watersheds KMZ file that accompanies this calculator. Then determine the AA's approximate elevation (bottom right, NOT the "eye alt"). Then move cursor around to determine the watershed's maximum and minimum elevation. Divide the AA's elevation by the (max-min).	0.12	[FA, NR, Sens, SFSv, WCv, WSv]
OF19	Water Quality Sensitive Watershed or Area	In Google Earth, open the KMZ file NB_Watershed Protected Area which accompanies this calculator. The AA is within such an area. Enter 1= yes, 0= no.	0	If an ACCDC report is available for this AA, it also may contain such information. [NRv]
OF20	Degraded Water Upstream	Sampling indicates a problem with concentrations ofmetals, hydrocarbons, nutrients, or other substances (excluding bacteria, acidic water, high temperatures) being present at levels harmful to aquatic life or humans, and:		May use existing data, or sample those waters as part of this wetland assessment. "Harmful" should be evaluated with regard to current federal or provincial water quality standards. [AM, FA, FR, NRv,
		The condition is present within the AA.	0	PRv, SRv, STR, WBF, WBN]
		The condition is present in waters within 1 km that flowinto the AA, but has not been documented in the AA itself.	0	
		Sampling during both low water periods and times with high runoff (storms, snowmelt) indicates no problems in either the AA or inflowing	0	
		waters. Data are insufficient (no or inadequate sampling within 1 km, or condition exists only at >1 km upstream)This is the situation for nearly	1	
OE21	Degraded Water	all wetlands in this region. The problem described above is downslope from the AA, and:		May use existing data, or monitor waters as part of this wetland assessment. [NRv, PRv, SRv]
UFZI	Downstream			may use existing data, or monitor waters as part or this welland assessment. [INRV, PRV, SRV]
		The condition is present within 1 km downslope and connected to the AA by a channel.	1	
		The condition is present within 5 km downslope and connected to the AA by a channel, or within 1 km but not connected to the AA by a channel. Sampling during both low water periods and times with high runoff (storms, snowmelt) indicates no problems in either the AA or inflowing	0	
		Samping during bour low water periods and times with right furion (storms, showmen) indicates no problems in eliner the AA or inhowing waters. Data are insufficient (no or inadequate sampling within 1 km, or condition exists only at >1 km upstream)This is the situation for nearly	0	
0500		all wetlands in this region.		
OF22	Wetland as a % of Its Contributing Area (Catchment)	From a topographic map and field observations, estimate the approximate boundaries of the calchment (CA) of the entire wetland of which the AA may be only a part. Then adjust those boundaries if necessary based on your field observations of the surrounding analydr to this procedures described in the Manual. Divide the area of the wetland (not just the AA) by the approximate area of its calchment excluding the area of the wetland itself. When doing the calculation, if ponded water is adjacent to the wetland, include that in the wetland area. The result is:		Topographic maps may be viewed online at the National Altas of Canada (Toporama): http://atlas.gc.ca/loporama/en/index.html [NR, PR, Sens, SR, WS]
		<0.01, or catchment size unknown due to stormwater pipes that collect water from an indeterminate area.	0	
		0.01 to 0.1.	0	
		0.1 to 1. >1 (wetland is larger than its catchment (e.g., wetland with flat surrounding terrain and no inlet, or is entirely isolated by dikes, or is a raisee	0	
OF23	Unvegetated Surface in	bog). The proportion of the AA's contributing area (measured to no more than 1000 m upslope) that is comprised of buildings, roads, parking tots		[FA, INV, NRv, PRv, SRv, STR, WCv, WSv]
	the Contributing Area	other pavement, exposed bedrock, landslides, and other mostly-bare surface is about : <10%.	1	
		10 to 25%.	0	
		>25%.	0	

		-		
OF24	Transport From Upslope	A relatively large proportion of the precipitation that falls farther upslope in the CA reaches this wetland quickly as runoff (surface water), as		[NRv, PRv, SRv, WSv]
		indicated by the following:		
		(a) input channel is present,		
		(b) input channels have been straightened,		
		(c) upslope wetlands have been ditched extensively,		
		(d) land cover is mostly non-forest, (e) CA slopes are steep, and/or		
		(f) most CA soils are shallow (bedrock near surface) and/or have high runoff coefficients.		
		This statement is:		
		THE SHARING IS		
		Mostly true.	0	
		Somewhat true.	0	
			1	
		Mostly untrue.		
OF25	Aspect	The overland flow direction of most surface water (in streams, rivers, or runoff) that enters the AA is:		[AM, NR, SFS, WC, WS]
		Northward (N, NE), north-facing contributing area.	0	1
		Southward (S, SW), south-facing contributing area.	- 1	
		Other (E, SE, W, NW), or no detectable uphill slope or input channel (flat).	0	
OE26	Internal Flow Distance	The horizontal flow distance from the wetland's inlet to outlet is:	Ů	Identify inlets and outlets, if any, from topographic maps (use elevations to determine which are inlet
01 20	(Path Length)	The nonzoniar now distance from the welland 3 filler to dutler is.		and which are outlets) and augment by field inspection. [NR, OE, PR, SR, WS]

Form F (Field). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Walk for no less than 10 minutes from the wetland edge towards its core, in the part of the AA that is proposed for alteration. If no alteration is proposed, walk in a portion that appears to be most representative of the wetland overall. Walk only where it is safe and legal to do so. Conduct the assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answer these questions primarily based on your onsite observations and interpretations. Do not write in shaded parts of this data form. Answering some questions accurately may require conferring with the landowner or other knowledgable persons and/or reviewing aerial imagery. For most wetlands, completing this field data form will require 1-2 hours on a site. For a list of functions to which each question pertains, see the accompanying Interpretations form. For detailed descriptions of each WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage & Delay, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity, STR= Stressors.

#	Indicators	Condition Choices	Data	Definitions/Explanations
1	Wetland Type	Follow the key below and mark the ONE row that best describes MOST of the vegetated part of the AA:		Ericaceous shrubs are ones in the heather family (Ericaceae). Most have leathery evergreen leaves. They include rhododendron, azalea, swamp laurel, leatherleaf, Labrador tea, and others. Most require
		A. Moss and/or lichen cover more than 25% of the ground. Often dominated by ericaceous shrubs (e.g., Labrador tea) or other acid-tolerant plants (e.g., bog cranberry, pitcher plant, sundew, orchids). Substrate is mostly undecomposed peat. Choose between A1 and A2 and mark the choice with a 1 in their adjoining column. Otherwise go to B below.		acidic soil. Although not in the family Ericaceae, sweetgale (Myrica gale) should be counted also. [AM, CS, FA, FR, INV, NR, OE, PH, Sens, SFS, WBF, WBN]
		A1. Surface water is usually absent or, if present, pH is typically <4.5 and conductivity is usually <100 µS/cm (<64 ppm TDS). Trees are absent or nearly so. Sedge cover usually sparse or absent but cottongrass and/or lichen cover may be extensive, as well as cloudberry, lingonberry, sheep laurel, and a sedge (Carex rarillora). Welfand surface and surrounding landscape are seldom sloping and welfand often is domed (convex). Inlet and outlet channels are usually absent. If known, pH of peat is <4.0.	0	
		A2. Not A1. Surface water, if present, has pH typically >4.5 and conductivity is usually >100 µS/cm (>64 ppm TDS). Sedge cover is usually extensive, and/or tree and fall shrub cover is extensive. Sometimes at toe of slope or edge of water body. An exit channel is usually present. Wetter than A1 and peat depth may be shallower (<2 m).	0	
		B. Moss and/or lichen cover less than 25% of the ground. Soil is mineral or decomposed organic (muck). Choose between B1 and B2 and mark the choice with a 1 in their adjoining column:		
		B1. Trees and shrubs taller than 1 m comprise more than 25% of the vegetated cover. Surface water is mostly absent or inundates the vegetation only seasonally (e.g., vernal pools or floodplain).	1	
		B2. Not B1. Tree & tall shrubs comprise less than than 25% of the vegetated cover. Vegetation is mostly herbaceous, e.g., cattail, bulrush, burreed, pond lily, horsetail. Surface water may be extensive and fluctuates seasonally, being either persistent or drying up partly or entirely.	0	
		the AA should include all persistent waters in ponds smaller than 8 hectares (~283 m on a side) that are adjacent to the AA. The		
nclud adja lescri	e the open water part ad, cent " is used synonymo bed features along their i	the water area of adjacent ponded water larger than 8 ha and adjacent rivers wider than 20 m. Specifically, the AA should ijacent to wetland vegetation and equal in width to the average width of that vegetated zone. Throughout this data form, usty with abutting, adjoining, bordering, contiguous and means no upland (manmade or natural) completely separates the directly shared edge. Features joined only by a channel are not necessarily considered to be adjacent a large portion of their res do not have to be hydrologically connected in order to be considered adjacent.		
2	Wetland Types - Adjoining or Subordinate	If the AA is smaller than 1 ha, mark all other types that occupy more than 1% of the vegelated AA. If the AA is larger than 1 ha, mark all other types which are within or adjacent to the AA and occupy more than 1 ha, as visible from the AA or as interpreted from aerial imagery. Do not mark again the type marked in F1.		1 hectare is 10,000 sq. m or about 2.5 acres. It could have dimensions of 100 m by 100 m, 1000 m b 10 m, or similar. [AM, INV, SBM, WBF]
		A1.	0	
		A2. B1.	0	
		B2.	1	
3	Woody Height & Form Diversity	Following EACH row below, indicate with a number code the percentage of the living vegetation in the AA which is occupied by that feature (6 if >95%, 5 if 75-95%, 4 if 50-75%, 3 if 25-50%, 2 if 5-25%, 1 if <5%, 0 if none). If the vegetated part of the AA is largely herbaceous (non-woody) vegetation, these percentages should not sum to 100%.		Deciduous shrubs in this region usually include buttonbush, Labrador tea, bayberry (Morella), huckleberry, cranberry, cloudberry, sweetglade, alder, willow, birch, ash, dogwood, and a few others. Il you assigned a code of 3 or higher to any of the first four choices and the ground cover beneath the trees/shrubs is <25% moss, then question F1 might be "B1". [CS, INV, NR, PH, POL, SBM, Sens]
		coniferous trees (may include tamarack) taller than 3 m. deciduous trees taller than 3 m.	5	accessing to the second
		coniferous or ericaceous shrubs or trees 1-3 m tall not directly below the canopy of trees.	2	
		deciduous shrubs or trees 1-3 m tall not directly below the canopy of trees.	2	
		coniferous or ericaceous shrubs <1 m tall not directly below the canopy of taller vegetation. deciduous shrubs or trees <1 m tall (e.g., deciduous seedlings) not directly below the canopy of taller vegetation.	1	
ote :	If none of top 4 rows in	F3 was marked 2 or greater, SKIP to F9 (N fixers).		
1	Dominance of Most	Determine which two woody plant species comprise the greatest portion of the low (<3 m) woody cover . Then choose one:		[PH, POL, SBM, Sens]
	Abundant Shrub Species	those species together comprise > 50% of such cover.	1	
_		those species together do not comprise > 50% of such cover.	0	
J	Woody Diameter Classes	Mark ALL the types that comprise >5% of the woody canopy cover in the AA or >5% of the wooded areas (if any) along its upland edge (perimeter). The edge should include only the trees whose canopies extend into the AA. Conference. 1-9 cm diameter and > Im tall.	1	Estimate the diameters at chest height. If small-diameter trees are overtopped (shaded) by larger ones, visualise a "subcanopy" at the average height of the smaller-dbh trees, to serve as a basis for minimum 5% canopy requirement in this question. The trees and shrubs need not be wetland specie
		broad-leaved deciduous 1-9 cm diameter and >1 m tall.	1	[AM, CS, POL, SBM, Sens, WBN]
		coniferous, 10-19 cm diameter.	1

	Robust Emergents	25-50% of the water edge. 50-75% of the water edge. >75% of the water edge. The percentage of the emergent vegetation cover in the AA that is cattail (<i>Typha</i> spp.), common reed (<i>Phragmiles</i>), or tall (>1m) bulrush is:	0 1 0	

FieldF form - Non-tidal Page 3 of 5

F37	Interspersion of	During most of the part of the growing season when water is present, the spatial pattern of emergent vegetation within the water is mostly:		[AM, FA, FR, INV, NR, OE, PH, PR, SBM, SR, WBF, WBN]
	Emergents & Open Water	Scattered. More than 30% of such vegetation forms small islands or corridors surrounded by water.	0	
	water	Intermediate.	0	
		Clumped. More than 70% of such vegetation is in bands along the wetland perimeter or is clumped at one or a few sides of the surface water area.	0	
F38	Persistent Deepwater	If the deepest patch of surface water (flowing or ponded) in or directly adjacent to the AA is mostly deeper than 0.5 m for >2 weeks during the	1	
F39	Area Non-vegetated Aquatic	growing season, enter "1" and continue. If not, enter "0" and SKIP to F42.(Connection). During most of the growing season and in waters deeper than 0.5 m, the cover for fish, aquatic invertebrates, and/or amphibians that is		For this question, consider only the wood that is at or above the water surface. Estimates of underwater
137	Cover	provided NOT by living vegetation, but by accumulations of dead wood and undercut banks is:		wood based only on observations from terrestrial viewpoints are unreliable so should not be attempted.
		Little or none. Intermediate.	0	[AM, FA, FR, INV]
		Extensive.	0	
F40	Isolated Island	The AA contains (or is part of) an island or beaver lodge within a lake, pond, or river, and is isolated from the shore by water depths > 1 m on all sides during an average June. The island may be solid, or it may be a floating vegetation mat that is sufficiently large and dense to support a waterbird nest.	0	[WBN]
F41	Duckweed	Al some time of the year, mats of algae and/or duckweed are likely to cover >50% of the AA's otherwise-unshaded water surface, or blankel >50% of the underwater substrate. If true, enter "1" in next column. If untrue or uncertain, enter "0".	0	[EC, PR, WBF]
F42	Channel Connection & Outflow Duration	The most persistent surface water connection (outlet channel or pipe, ditch, or overbank water exchange) between the AA and a downslope stream network is: [Note: If the AA represents only part of a welland, answer this according to whichever is the least permanent surface connection: the one between the AA and the rest of the wetland, or the surface connection between the wetland and the downslope stream network.] Persistent (surface water flows out for >9 months/year).	1	Consider the connection regardless of whether the surface water is frozen. The "downslope stream network" could consist of ditches, rivers, ponds, or lakes which eventually connect to the ocean. If this cannot be determined white visiting the AA, consult topographic maps perhaps by viewing these online with Toporama (http://atlas.mccan.gc.ca/toporama/en/index.html) [CS, FA, FR, NR, OE, PR, Sens, SFS SR, WCv, WS]
		Seasonal (surface water flows out for 14 days to 9 months/year, not necessarily consecutive).	0	
		Temporary (surface water flows out for <14 days, not necessarily consecutive). None but maps show a stream network downslope from the AA and within a distance that is less than the AA's length. SKIP to F47 (pH	0	
		Measurement).		
		No surface water flows out of the wetland except possibly during extreme events (-once per 10 years). Or, water flows only into a wetland, ditch, or lake that lacks an outlet. SKIP to F47 (pH Measurement).	0	
F43	Outflow Confinement	During major runoff events, in the places where surface water exits the AA or connected waters nearby, the water:		"Major runoff events" would include biennial high water caused by storms and/or rapid snowmelt. [CS, NR, OE, PR, Sens, SR, STR, WS]
		Mostly passes through a pipe, culvert, narrowly breached dike, berm, beaver dam, or other partial obstruction (other than natural topography) that does not appear to drain the wetland artificially during most of the growing season.	1	,,,,,
		Leaves through natural exits (channels or diffuse outflow), not mainly through artificial or temporary features.	0	
		Is exported more quickly than usual due to ditches or pipes within the AA or connected to its outlet, or within 10 m of the AA's edge, which drain the wetland artificially, or water is pumped out of the AA.	0	
F44	Tributary Channel	At least once annually, surface water from a tributary channel that is >100 m long moves into the AA. Or, surface water from a larger permanent water body adjacent to the AA spills into the AA. If it enters only via a pipe, that pipe must be fed by a mapped stream or lake further upslope. If no, SKIP to F47 (pH Measurement).	0	If inlet tributaries cannot be searched for due to inaccessibility of part of the AA, follow suggestions in F42 above. [NRv, PH, PRv, SRv]
F45	Input Water Temperature	Based on lack of shade, water source characteristics, or actual temperature measurements, the inflow is likely to be warmer than surface water in the AA during part of most years. Enter 1= yes, 0= no.	1	[WCv]
F46	Throughflow	During its travel through the AA at the time of peak annual flow, water arriving in channels: [select only the ONE encountered by most of the incoming water].		[FA, FR, INV, NR, OE, PR, SR, WS]
	Resistance	Does not bump into many plant stems as it travels through the AA. Nearly all the water continues to travel in unvegetated (often incised)	0	
		channels that have minimal contact with wetland vegetation, or through a zone of open water such as an instream pond or lake.		
		Bumps into herbaceous vegetation but mostly remains in fairly straight channels. Bumps into herbaceous vegetation and mostly spreads throughout, or is in widely meandering, multi-branched, or braided channels.	0	
		Bumps into tree trunks and/or shrub stems but mostly remains in fairly straight channels. Bumps into tree trunks and/or shrub stems and follows a fairly indirect path from entrance to exit (meandering, multi-branched, or braided).	0	
F47	pH Measurement	The pH in most of the AA's surface water:		Preferably, measure this in larger areas of ponded surface water within the AA, or in streams that have passed through (not along) most of the AA. Unless surface water is completely absent, do not dig holes
		Was measured, and is: [enter the reading in the column to the right.] Was not measured but surface water is present and is darkly tea-coloured. Or if no surface water, then mosses and plants that indicate	0	or make depressions in peat in order to provide water for this measurement. Avoid measuring near
		peatland (e.g., Labrador tea) are prevalent. Enter "1".		roads or in puddles formed only by recent rain. [AM, FA, FR, NR, WBF, PH, PR, Sens, WBF, WBN]
F48	TDS and/or	Neither of above. Enter "1". The TDS (total dissolved solids) or conductivity off the AA's surface water is: (select the first true row with information):	1	See above for measurement guidance. [FR, INV, NRv, PH, PRv, Sens]
	Conductivity	TDS is: [Enter the reading in ppm or mg/L in the column to the right, if measured, or answer next row.]		
		Conductivity is [Enter the reading in µS/cm in the column to the right.] Was not measured, but plants that indicate saline conditions cover much of the vegetated AA. Enter *1*.	0	
		Was not measured, but plants that indicate saline conditions cover much or the vegetated AAL criter 1. Neither of above	1	
F49	Beaver Probability	Use of the AA by beaver during the past 5 years is (select most applicable ONE):		[FA, FR, PH, SBM, Sens, WBF, WBN]
		Evident from direct observation or presence of gnawed limbs, dams, tracks, dens, lodges, or extensive stands of water-killed trees (snags).	0	
		Likely based on known occurrence in the region and proximity to suitable habitat, which may include: (a) a persistent freshwater wetland, pond, or lake, or a perennial low or mid-gradient (<10%) channel, and (b) a corridor or multiple stands of hardwood trees and shrubs in	1	
		vegetated areas near surface water.		
F50	Groundwater Strength	Unlikely because site characteristics above are deficient, and/or this is a settled area or other area where beaver are routinely removed. Select first applicable choice:	0	Adhere to these criteria strictly do not use personal judgment based on fen conditions, pH, or other
	of Evidence	Springs are known to be present within the AA, or if groundwater levels have been monitored, that has demonstrated that groundwater primarily discharges to the wetland for longer periods during the year than periods when the wetland recharges the groundwater.	0	evidence. Consult lopographic maps to detect breaks in slope described here. Rust deposits associated with groundwater seeps may be most noticeable as orange discoloration in ice formations along streams during early winter. [AM, CS, FA, FR, INV, NR, OE, PH, PRv, SFS, WC, WS]
		Most of the AA has a slope of >5%, or is very close to the base of a natural slope longer than 100 and much steeper than the slope of the AA, AND the pH of surface water, if known, is >5.5.	0	
F51	Internal Gradient	Neither of above is true, although some groundwater may discharge to or flow through the AA. Or groundwater influx is unknown. The gradient along most of the flow path within the AA is:	1	This is not the same as the shoreline slope. It is the elevational difference between the AA's inlet and
	smar ordulont	<2% or the AA has no surface water outlet (not even seasonally).	1	outlet, divided by the flow-distance between them and converted to percent. If available, use a
		2-5%.	0	clinometer to measure this. Free clinometer apps can be downloaded to smartphones. If the wetland is large (longer than –1 km), this may be estimated using Google Earth to determine the minimum and
		6-10%. >10%.	0	maximum elevation within the AA, then dividing by length and multiplying by 100. [CS, NR, OE, PR, SR, WBF, WBN, WS]
		ions: If the AA lacks an upland edge, evaluate based on the AA's entire perimeter, and moving outward into whatever areas are		
adjace F52		nese questions are best answered by measuring from aerial images. Within a zone extending 30 m laterally from the AA's edge with upland and/or other wetlands, the percentage that contains perennial		[AM, FA, FR, INV, NRv, PH, POL, PRv, SBM, Sens, SRv, STR, WBN]
	of Perimeter	vegetation cover (except lawns, row crops, heavily grazed land, conifer plantations) is:

FieldS form Non-tidal 2

Assessment Area (AA) Results:

Wetland ID: MC-W-01

Date: 9 October 2019

Observer: Derrick Mitchell

Latitude & Longitude (decimal degrees): 45.188198, -66.187343

Scores will appear below after data are entered in worksheets OF, F, and S. See Manual for definitions and descriptions of how scores were computed.

computed.						
Wetland Functions or Other Attributes:	Function Score (Normalised)	Function Rating	Benefits Score (Normalised)	Benefits Rating	Function Score (raw)	Benefits Score (raw)
Water Storage & Delay (WS)	2.06	Lower	0.22	Lower	3.32	0.30
Stream Flow Support (SFS)	4.48	Moderate	3.28	Moderate	2.39	1.91
Water Cooling (WC)	2.92	Moderate	4.08	Moderate	1.94	2.46
Sediment Retention & Stabilisation (SR)	3.78	Moderate	10.00	Higher	5.74	10.00
Phosphorus Retention (PR)	4.09	Moderate	10.00	Higher	5.81	10.00
Nitrate Removal & Retention (NR)	2.28	Moderate	10.00	Higher	5.24	10.00
Carbon Sequestration (CS)	5.36	Moderate			6.87	
Organic Nutrient Export (OE)	4.43	Moderate			4.68	
Anadromous Fish Habitat (FA)	0.00	Lower	0.00	Lower	0.00	0.00
Resident Fish Habitat (FR)	4.40	Moderate	2.84	Moderate	2.62	2.01
Aquatic Invertebrate Habitat (INV)	3.95	Moderate	6.43	Higher	5.26	4.71
Amphibian & Turtle Habitat (AM)	5.89	Moderate	7.08	Higher	6.41	6.39
Waterbird Feeding Habitat (WBF)	7.63	Higher	5.00	Moderate	6.07	5.00
Waterbird Nesting Habitat (WBN)	5.95	Higher	5.00	Moderate	5.08	5.00
Songbird, Raptor, & Mammal Habitat (SBM)	9.75	Higher	5.00	Moderate	8.08	5.00
Pollinator Habitat (POL)	9.16	Higher	10.00	Higher	7.38	10.00
Native Plant Habitat (PH)	7.05	Higher	10.00	Higher	5.93	10.00
Public Use & Recognition (PU)			2.07	Lower		1.80
Wetland Sensitivity (Sens)			0.00	Lower		2.20
Wetland Ecological Condition (EC)			4.94	Moderate		7.08
Wetland Stressors (STR) (higher score means more stress)			4.57	Moderate		3.94
Summary Ratings for Grouped Functions:						
HYDROLOGIC Group (WS)	4.48	Moderate	0.22	Lower	3.32	0.30
WATER QUALITY SUPPORT Group (max+avg/2 of SR, PR, NR, CS)	3.74	Moderate	10.00	Higher	6.39	10.00
AQUATIC SUPPORT Group (max+avg/2 of SFS, INV, OE, WC)	4.21	Moderate	5.52	Higher	4.42	3.87
AQUATIC HABITAT Group (max+avg/2 of FA, FR, AM, WBF, WBN)	6.21	Moderate	5.53	Moderate	5.23	5.03
TRANSITION HABITAT Group (max+avg/2 of SBM, PH, POL)	9.20	Higher	9.17	Higher	7.61	9.17
WETLAND CONDITION (EC)			4.94	Moderate		7.08
WETLAND RISK (average of Sensitivity & Stressors)			2.28	Lower		3.07
	NOTE: A scor	e of 0 does not	mean the func	tion or benefit i	s absent from t	he wetland. It

NOTE: A score of 0 does not mean the function or benefit is absent from the wetland. It means only that this wetland has a capacity that is equal or less than the lowest-scoring one, for that function or benefit, from among the 98 NB calibration wetlands that were assessed previously.

Cover Page: Basic Description of Assessment	WESP-AC version 2
Site Name:	Burchill Wind Energy Project - PH-W-01
Investigator Name:	Matt Alexander
Date of Field Assessment:	20 September 2019
Nearest Town:	Lorneville (west Saint John), New Brunswick
Latitude (decimal degrees):	45.202795
Longitude (decimal degrees):	66.187736
Is a map based on a formal on-site wetland delineation available?	Yes
Approximate size of the Assessment Area (AA, in hectares):	1.93
AA as percent of entire wetland (approx.). Attach sketch map if AA is smaller than the entire contiguous wetland.	
What percent (approx.) of the wetland were you able to visit?	100
What percent (approx.) of the AA were you able to visit?	100
Were you able to ask the site owner/manager about any of the questions?	No
Indicate here if you intentionally surveyed for rare plants, calciphile plants, or rare animals	Yes
Have you attended a WESP-AC training session? If so, indicate approximate month & year	Yes, September 2016
How many wetlands have you assessed previously using WESP-AC? (approx.)	15
Comments about the site or this WESP-AC assessment (attach extra page if desired):	Catches runoff from Paddy's Hill and Paddy's Hill Road.

Form OF (Office). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Conduct an assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answering many of the questions below will require using these online map viewers:

Google Earth Pro: https://www.google.com/earth/download/gep/agree.html

GeoNB: http://www.snb.ca/geonb1/ and http://www.snb.ca/geonb1/e/apps/apps-E.asp

)F1	Indicators	Condition Choices	Data	Definitions/Explanations
	Province	Mark the province in which the AA is located by changing the 0 in the column next to it to a *1". Mark only one.		This determines to which province's calibration wetlands the raw score of any wetland is normalise
		New Brunswick	1	In the function and benefits models, it also triggers the automatic exclusion of indicators for which spatial data exists in a particular province.
		Nova Scotia	0	spanial data oxists in a particular province.
		Prince Edward Island	0	1
		Newfoundland-Labrador	0	1
2	Ponded Area Within 1 km.	The area of surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) within 1 km is:		"Adjacent" means not separated from the AA by a wide expanse (>50 m) of upland (including roa >50 m wide). Include ponded areas likely to be hidden by wetland vegetation. If surface water
		<0.01 hectare (about 10 m x 10 m).	0	extends beyond 1 km, include only the part within 1 km. Do not include tidal areas. Measure the
		0.01 - 0.1 hectare.	0	from aerial imagery using Google Earth Pro (click on Ruler icon in toolbar, then Polygon in pop-up
	ł	0.1 - 1 hectare.	0	menu). With the GeoNB viewer, enable the Wetlands layer, then measure with the Draw & Measu tool after specifying Aerial as the Basemap. However, do not rely entirely on wetland boundaries
	ł	1 to 10 hectares.	0	shown in online wetlands layers. [PH, SBM, WBN]
		10 to 100 hectares.	- 1	
		>100 hectares.	0	
	Ponded Water & Wetland Within 1 km.	The area of wetlands and surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) within 1 km is:	n	See definition of adjacent in OF2. If the AA's wetland vegetation extends beyond 1 km, include o the part within 1 km. "Ponded" means not flowing in rivers or streams. [Sens, WBF]
		<0.01 hectare (about 10 m x 10 m).	0	
		0.01 - 0.1 hectare.	0	
		0.1 - 1 hectare.	0	
		1 to 10 hectares.	0	
		10 to 100 hectares.	1	
		>100 hectares.	0	
4	Size of Largest Nearby Vegetated Tract or	The largest vegetated patch or corridor that includes the AA's vegetation plus aladjacent upland vegetation that is not lawn, row crops, heavily grazed lands, conifer plantation is:		See definition of adjacent in OF2. Use Google Earth Pro's polygon ruler (as described above). Exclude conifer plantations only if it is obvious that trees were planted in rows. [AM, PH, SBM, Se
	Corridor	<0.01 hectare (about 10 m x 10 m).	0	
		0.01 - 0.1 hectare.	0	
		0.1 - 1 hectare.	0	
	ł	1 to 10 hectares.	0	
		10 to 100 hectares.	0	
		100 to 1000 hectares.	0	
		>1000 hectares. [This is nearly always the answer in relatively undeveloped landscapes]	1	
F5	Distance to Large Vegetated Tract	The minimum distance from theedge of the AA to the edge of the closest vegetated land (but excluding row crops, lawn, conifer plantation) larger than 375 hectares (about 2 km on a side), is:		To measure distance, use Google Earth Pro (Ruler > Line tool). Or use Draw & Measure tool at GeoNB. The 375-ha criterion is from the Fundy Model Forest Project. [AM, PH, POL, SBM, Sens
		450 m, and not separated from the 375-ha vegetated area by any width opaved roads, stretches of open water, row crops, bare ground, lawn, or impervious surface. Or the AA itself contains >375 ha of vegetation. [This is often the answer in relatively undeveloped landscapes.]	1	
		<50 m, but completely separated from the 375-ha vegetated area by those features, and AA does not contain >375 ha of vegetation.	0	
		50-500 m, and not separated.	0	
	ł	50-500 m, but separated by those features.	0	1
		0.5 - 5 km, and not separated.	0	
	ł	0.5 - 5 km, but separated by those features.	0	
		None of the above (the closest patches or corridors which are that large are >5 km away).	0	
6	Herbaceous Uniqueness	The AA's vegetation cover is >10% herbaceous* but uplands within 5 km have <10% herbaceous cover. If so, enter "3" and continue to OF7. If not, consider: The AA's vegetation cover is >10% herbaceous* but uplands within 1 km have <10% herbaceous cover. If so enter "2" and continue to OF7. If not, consider: The AA's vegetation cover is >10% herbaceous* but uplands within 100 m of the wetland edge have <10% herbaceous cover. If so, enter "1". "NOTE: Exclude lawns, row crops, heavily grazed lands, forest, shrublands. Include moss as well as grasslike plants in this use of "herbaceous vegetation"]	3	For this question only, consider moss to be herbaceous vegetation. Determine the score by view areal imagery in Google Earth after successively drawing or estilianting the boundaries of the but of 5 km, 1 km, and 100 m radius focused on the center of the AA. Circles of specified radius can drawn in Google Earth Pro by clicking on the Ruler icon, then Circle in the pop-up menu. [AMv, F POLv, SBMv, WBFv, WBNv]
7	Woody Uniqueness	The AA's vegetation cover is >10% woody* but uplands within 5 km have <10% woody cover. If so, enter "3" and continue to OF8. If not,	0	See above. Do not consider conifer plantations to be forest if it is obvious that trees were planted
		consider: The AA's vegetation is >10% woody" but uplands within 1 km have <10% woody cover. If so enter "2" and continue to OF8. If not, consider:		rows. [AMv, PHv, POLv, SBMv]
		The AA's vegetation is >10% woody" but uplands within 100 m of the wetland edge have <10% woody cover. If so, enter "1" [" NOTE: woody cover = trees & shrubs taller than 1 m.]		
)F8	Local Vegetated Cover Percentage	Draw a 5-km radius circle measured from the center of the AA. Ignoring all permanent water in the circle, the percent of the remaining are that is wooded or unmanaged herbaceous vegetation (NOT lawn, row crops, bare or heavily grazed land, clearcuts, or confer plantations)		in Google Earth, draw the 5 km buffer and then estimate land cover percentages, or do GIS analy of an appropriate land cover layer. [AM, PH, POL, SBM, Sens]

Bare pervious surface, e.g., lawn, recent (-5 yrs ago) clearcut, dift or gravel road, cropland, landside, conifer plantation. Measured along the maintained road nearest the AA, the distance to the nearestpopulation center is: -100 m.	0 0 0 1 1	"Population center" means a settled area with more than about 5 regularly- inhabited structures p square kilometer. In Google Earth, click on the Ruler icon, then Path, and draw and measure the route. Or use the GeoNB's Draw & Measure tool> Freehand Line to draw and measure the route Settlements (click on Place Names in menu) or other areas not close to mapped settlements but

			-	
OF11	Distance to Nearest Maintained Road	From the center of the AA, the distance to the nearest maintained public road (dirt or paved) is:		Determine this by viewing aerial imagery in Google Earth and measuring with the Ruler>Line tool. use the GeoNB's Draw Line tool. [AM, FAv, FRv, NRv, PH, PU, SBM, STR, WBN]
	Walitalieu Rodu	<10 m.	0	use the George's Draw Line tool. [AW, FAV, FRV, INRV, FR, FU, SDW, STR, WDN]
		10 - 25 m.	1	
		25 - 50 m.	0	
		50 - 100 m. 100 - 500 m.	0	
		>500 m.	0	
OF12	Wildlife Access	Draw a circle of radius of 5 km from the center of the AA. If mammals and amphibians can move from the center of the AA to ALL other separate wetlands and ponds located within the circle without being forced to cross pavement (any width), lawns, bare ground, and/or marine waters, mark 1 = yes can move to all, 0 = no. Change toblank if there are no other wetlands within 5 km.	0	In NB, enable the Wellands layer in GeoNB (despite its omissions) to show surrounding wellands roads, while estimating the location of the 5 km circle (or draw the 5 km circle in Google Earth Pro using the Circle tool and compare). Evaluate using Google Earth, being cautious to search for road hidden under forest canopy. [AM, SBM, STR]
OF13	Distance to Ponded	The distance from the AA center to the closest (but separate) ponded water body visible in GoogleEarth imagery is:		In Google Earth, zoom in closely to examine the surrounding landscape for ponds, lakes, and
0.10	Water	<50 m, and not separated by any width of paved roads, stretches of open water, row crops, lawn, bare ground, or impervious surface.	0	wellands that appear to be permanently flooded. Enable the GeoNB viewer's Wellands layer as w [AM, PH, SBM, Sens, WBF, WBN]
		<50 m, but completely separated by those features. 50-500 m, and not separated.	0	
		50-500 m, and not separated. 50-500 m, but separated by those features.	0	-
		0.5 - 1 km, and not separated.	0	
		0.5 - 1 km, but separated by those features.	- 1	
		None of the above (the closest patches or corridors that large are >1 km away).	0	
OF14	Distance to Large Ponded Water	The distance from the AA center to the closest (tull separate)non-lidal body of water that is ponded during most of the year and islarger than 8 hectares during most of a normal year is: 100 m.	0	Determine this by viewing aerial imagery in Google Earth. [Sens, WBF, WBN]
		100 m - 1 km.	1	
		1 -2 km.	0	
		2-5 km.	0	1
		5-10 km.	0	
05/-	7116	>10 km.	0	
OF15	Tidal Proximity	The distance from the AA edge to the closesttidal water body (regardless of its salinity) is:		In Google Earth, measure the distance to the ocean (including Bay of Fundy) or tidal river, whicher is closer. If you need to see how far upriver a river is tidal, see the KMZ file provided with this
		<100 m.	0	calculator for NB (NB Headtide). Points shown in those files are only an approximation, so local
		100 m - 1 km.	0	information if available may be preferable. [FA, WBF]
		1 - 5 km. 5-10 km.	0	
		0-10 km.	0	-
		>40 km.	0	
OF16	Upland Edge Contact	Select one:		[NR, SBM, Sens]
		The AA has no upland edge (or upland is <1% of perimeter). The AA is entirely surrounded by (& contiguous with) other wetlands or water	. 0	
		1-25% of the AA's perimeter abuts upland (including filled areas). The rest adjoins other wellands or water that is mostly wider than the AA		
		25-50% of the AA's perimeter abuts upland. The rest adjoins other wetlands or water that is mostly wider than the AA.	0	
		50-75% of the AA's perimeter abuts upland. The rest adjoins other wetlands or water that is mostly wider than the AA. More than 75% of the AA's perimeter abuts upland. Any remainder adjoins other wetlands or water that is mostly wider than the AA.This	0	
		will be true for most assessments done with WESP-AC.		
OF17		Within 5 km downstream or downslope of the AA (select first true choice):		In the GeoNB map viewer: click on "More" in upper right, then "Flood Information". Expand the me
	tidal Waters	Maps show Flood Zone or Flood Risk areas and there appears to be infrastructure vulnerable to river flooding not caused by tidal storm surges.	0	under it by clicking on the arrow to its left and the slider to its right. Uncheck the first (Limits of Dat box. Where available, LiDAR imagery can provide finer elevational resolution useful for flood modeling, [WSv]
		Maps show Flood Zone or Flood Risk areas, but infrastructure is absent or is not vulnerable to floods from a non-tidal river. In some case: evees, upriver dams, or other measures may partly limit damage or risk from smaller events. Maps do not show Flood Zone or Flood Risk areas; or no such mapping has been done locally) and there appears to be infrastructure	0	
		vulnerable to river flooding unrelated to tidal storm surges. Maps do not show Flood Zone or Flood Risk areas (or no such mapping has been done locally) and there i so infrastructure vulnerable	1	
OF18	Relative Elevation in Watershed	to river flooding unrelated to tidal storm surges. In Google Earth, enable the Terrain layer (lower left menu) and open the NB_Watersheds KMZ file that accompanies this calculator. Then determine the AA's approximate elevation (bottom right, NOT the "eye alt"). Then move cursor around to determine the watershed's maximum and minimum elevation. Divide the AA's elevation by the (max-min).	0.68	[FA, NR, Sens, SFSv, WCv, WSv]
OF19	Water Quality Sensitive Watershed or Area	in Google Earth, open the KMZ file NB_Watershed Protected Area which accompanies this calculator. The AA is within such an area. Enter 1= ves. 0= no.	0	If an ACCDC report is available for this AA, it also may contain such information. [NRv]
OF20	Degraded Water Upstream	Sampling indicates a problem with concentrations ofmetals, hydrocarbons, nutrients, or other substances (excluding bacteria, acidic water, high temperatures) being present at levels harmful to aquatic life or humans, and:		May use existing data, or sample those waters as part of this wetland assessment. "Harmful" shou be evaluated with regard to current federal or provincial water quality slandards. [AM, FA, FR, NR
		The condition is present within the AA.	0	PRv, SRv, STR, WBF, WBN]
		The condition is present in waters within 1 km that flowinto the AA, but has not been documented in the AA itself.	0	1
		Sampling during both low water periods and times with high runoff (storms, snowmelt) indicates no problems in either the AA or inflowing	0]
		waters. Data are insufficient (no or inadequate sampling within 1 km, or condition exists only at >1 km upstream)This is the situation for nearly	1	
		all wetlands in this region.		
OF21	Degraded Water	The problem described above is downslope from the AA, and:		May use existing data, or monitor waters as part of this wetland assessment. [NRv, PRv, SRv]
	Downstream	The condition is present within 1 km downslope and connected to the AA by a channel.	0	
		The condition is present within 5 km downslope and connected to the AA by a channel, or within 1 km but not connected to the AA by a	0	1
		channel.	0	
		Sampling during both low water periods and times with high runoff (storms, snowmelt) indicates no problems in either the AA or inflowing waters	U	
		Sampling during both low water periods and times with high runoff (storms, snowmelt) indicates no problems in either the AA or inflowing waters. Data are insufficient (no or inadequate sampling within 1 km, or condition exists only at >1 km upstream)This is the situation for nearly all wetlands in this region.	1	
OF22	Welland as a % of Its Contributing Area (Catchment)	waters. Data are insufficient (no or inadequate sampling within 1 km, or condition exists only at >1 km upstream)This is the situation for nearly	1	Topographic maps may be viewed online at the National Allas of Canada (Toporama): http://atlas.gc.ca/toporama/en/index.html [NR, PR, Sens, SR, WS]
OF22	Contributing Area	waters. Data are insufficient (no or inadequate sampling within 1 km, or condition exists only at >1 km upstream)This is the situation for nearly all wetlands in this region. From a topographic map and field observations, estimate the approximate boundaries of the catchment (CA) of the entire wetland of which the AA may be only a part. Then adjust those boundaries if necessary based on your field observations of the surrounding terrain, and/or lusing procedures described in the Manual. Divide the area of the wetland (not just the AA) by the approximate area of its catchment excluding the area of the wetland itself. When doing the calculation, if ponded water is adjacent to the wetland, include that in the wetland area. The result is:	1

Form F (Field). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Walk for no less than 10 minutes from the wetland edge towards its core, in the part of the AA that is proposed for alteration. If no alteration is proposed, walk in a portion that appears to be most representative of the wetland overall. Walk only where it is safe and legal to do so. Conduct the assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answer these questions primarily based on your onsite observations and interpretations. Do not write in shaded parts of this data form. Answering some questions accurately may require conferring with the landowner or other knowledgable persons and/or reviewing aerial imagery. For most wetlands, completing this field data form will require 1-2 hours on a site. For a list of functions to which each question pertains, see the accompanying Interpretations form. For detailed descriptions of each WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage & Delay, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity, STR= Stressors.

#	Indicators	Condition Choices	Data	Definitions/Explanations
1	Wetland Type	Follow the key below and mark the ONE row that best describes MOST of the vegetated part of the AA:		Ericaceous shrubs are ones in the heather family (Ericaceae). Most have leathery evergreen leaves. They include rhododendron, azalea, swamp laurel, leatherleaf, Labrador tea, and others. Most require
		A. Moss and/or lichen cover more than 25% of the ground. Often dominated by ericaceous shrubs (e.g., Labrador tea) or other acid-tolerant plants (e.g., bog cranberry, pitcher plant, sundew, orchids). Substrate is mostly undecomposed peat. Choose between A1 and A2 and mark the choice with a 1 in their adjoining column. Otherwise go to B below.		acidic soil. Although not in the family Ericaceae, sweetgale (Myrica gale) should be counted also. [AM, CS, FA, FR, INV, NR, OE, PH, Sens, SFS, WBF, WBN]
		A1. Surface water is usually absent or, if present, pH is typically <4.5 and conductivity is usually <100 µS/cm (<64 ppm TDS). Trees are absent or nearly so. Sedge cover usually sparse or absent but cottongrass and/or lichen cover may be extensive, as well as cloudberry, lingonberry, sheep laurel, and a sedge (Carex rarillora). Welland surface and surrounding landscape are seldom sloping and welland often is domed (convex). Inlet and outlet channels are usually absent. If known, pH of peat is <4.0.	0	
		A2. Not A1. Surface water, if present, has pH typically >4.5 and conductivity is usually >100 μS/cm (>64 ppm TDS). Sedge cover is usually extensive, and/or tree and fall shrub cover is extensive. Sometimes at toe of slope or edge of water body. An exit channel is usually present. Wetter than A1 and peat depth may be shallower (<2 m).	0	
		B. Moss and/or lichen cover less than 25% of the ground. Soil is mineral or decomposed organic (muck). Choose between B1 and B2 and mark the choice with a 1 in their adjoining column:		
		B1. Trees and shrubs taller than 1 m comprise more than 25% of the vegetated cover. Surface water is mostly absent or inundates the vegetation only seasonally (e.g., vernal pools or floodplain).	1	
		B2. Not B1. Tree & tall shrubs comprise less than than 25% of the vegetated cover. Vegetation is mostly herbaceous, e.g., cattail, bulrush, burreed, pond lily, horsetail. Surface water may be extensive and fluctuates seasonally, being either persistent or drying up partly or entirely.	0	
AA sh nclua a dja lescri	ould also include part of a le the open water part adj cent " is used synonymo libed features along their a	the AA should include all persistent waters in ponds smaller than 8 hectares (-283 m on a side) that are adjacent to the AA. The the water area of adjacent ponded water larger than 8 ha and adjacent rivers wider than 20 m. Specifically, the AA should jacent to welland vegetation and equal in width to the average width of that vegetated zone. Throughout its aform, usly with abutting, adjoining, bordering, contiguous and means no upland (mammade or natural) completely separates the directly shared edge. Features joined only by a channel are not necessarily considered to be adjacent a large portion of their res do not have to be hydrologically connected in order to be considered adjacent.		
2	Wetland Types - Adjoining or Subordinate	If the AA is smaller than 1 ha, mark all other types that occupy more than 1% of the vegetated AA. If the AA is larger than 1 ha, mark all other types which are within or adjacent to the AA and occupy more than 1 ha, as visible from the AA or as interpreted from aerial imagery. Do not mark again the type marked in F1.		1 hectare is 10,000 sq. m or about 2.5 acres. It could have dimensions of 100 m by 100 m, 1000 m b 10 m, or similar. [AM, INV, SBM, WBF]
		A1. A2.	0	
		B1.	0	
3	Woody Height & Form Diversity	B2. Following EACH row below, indicate with a number code the percentage of the living vegetation in the AA which is occupied by that feature (6 if >95%, 5 if 75-95%, 4 if 50-75%, 3 if 25-50%, 2 if 5-25%, 1 if <5%, 0 if none). If the vegetated part of the AA is largely herbaceous (non-woody) vegetation, these percentages should not sum to 100%.	0	Deciduous shrubs in this region usually include buttonbush, Labrador tea, bayberry (Morella), huckleberry, cranberry, cloudberry, sweetgale, alder, willow, birch, ash, dogwood, and a few others. It you assigned a code of 3 or higher to any of the first four choices and the ground cover beneath the
		coniferous trees (may include tamarack) taller than 3 m.	2	trees/shrubs is <25% moss, then question F1 might be "B1". [CS, INV, NR, PH, POL, SBM, Sens]
		deciduous trees taller than 3 m. coniferous or ericaceous shrubs or trees 1-3 m tall not directly below the canopy of trees.	2	
		deciduous shrubs or trees 1-3 m tall not directly below the canopy of trees.	3	
		coniferous or ericaceous shrubs <1 m tall not directly below the canopy of taller vegetation. deciduous shrubs or trees <1 m tall (e.g., deciduous seedlings) not directly below the canopy of taller vegetation.	3	
<u>Vote</u> :		F3 was marked 2 or greater , SKIP to F9 (N fixers).		
4	Dominance of Most Abundant Shrub	Determine which two woody plant species comprise the greatest portion of the low (<3 m) woody cover . Then choose one:		[PH, POL, SBM, Sens]
	Species	those species together comprise > 50% of such cover. those species together do not comprise > 50% of such cover.	0	
5	Woody Diameter Classes	Mark ALL the types that comprise >5% of the woody canopy cover in the AA or >5% of the wooded areas (if any) along its upland edge (perimeter). The edge should include only the trees whose canopies extend into the AA. conferous, 1-9 cm diameter and >1 m tall.	1	Estimate the diameters at chest height. If small-diameter trees are overtopped (shaded) by larger ones, visualise a "subcanopy" at the average height of the smaller-dbh trees, to serve as a basis for minimum 5% canopy requirement in this question. The trees and shrubs need not be welland specie.
		broad-leaved deciduous 1-9 cm diameter and >1 m tall.	1	[AM, CS, POL, SBM, Sens, WBN]
		coniferous, 10-19 cm diameter. broad-leaved deciduous 10-19 cm diameter.	1	
		coniferous, 20-40 cm diameter.	1	
		broad-leaved deciduous 20-40 cm diameter. coniferous, >40 cm diameter.	1	
		broad-leaved deciduous >40 cm diameter.	1	
6	Height Class Interspersion	Follow the key below and mark the ONE row that best describes MOST of the AA: A. Neither the vegetation taller than 1 m nor the vegetation shorter than that comprise >70% of the vegetated part of the AA. They each comprise 30-70%. Choose between A1 and A2 and mark the choice with a 1 in the adjoining column. Otherwise go to B below.		[AM, INV, NR, PH, SBM, Sens]
		A1. The two height classes are mostly scattered and intermixed throughout the AA.	0	
		A2. Not A1. The two height classes are mostly in separate zones or bands, or in proportionately large clumps. B. Eilher the vegetation shorter than 1 m comprises >70% of the vegetated part of the AA, or the vegetation taller than that does. One size class might even be totally absent. Choose between B1 and B2 and mark the choice with a 1 in the adjoining column:	1	
		B1. The less prevalent height class is mostly scattered and intermixed within the prevalent one. B2. Not B1. The less prevalent height class is mostly located apart from the prevalent one, in separate zones or clumps, or is completely	0	
7	Large Snags (Dead	absent. The number of large snags (diameter >20 cm) in the AA plus adjacent upland area within 10 m of the wetland edge is:		Snags are dead standing trees that often (not always) lack bark and foliage. Include only ones that a
	Standing Trees)	None, or fewer than 8/ hectare which exceed this diameter.	0	at least 2 m tall. [POL, SBM, WBN]
		Several (>8/hectare) and a pond, lake, or slow-flowing water wider than 10 m is within 1 km.	1	
		Several (>8/hectare) but above not true.	0	
8	Downed Wood	The number of downed wood pieces longer than 2 m and with diameter >10 cm, and not persistently submerged, is:		Exclude temporary "burn piles." [AM, INV, POL, SBM]
8	Downed Wood	The number of downed wood pieces longer than 2 m and with diameter >10 cm, and not persistently submerged, is: Few or none that meet these criteria.	0	Exclude temporary "burn piles." [AM, INV, POL, SBM]

FieldF form - Non-tidal Page 1 of 5

FO	N Fixers	The percentage of the AA's vegetated cover that contains nitrogen-fixing plants (e.g., alder, sweetgale, clover, lupine, alfalfa, other legumes)		Do not include N-fixing algae or lichens. [FA, FR, INV, NRv, OE, PH, SBM, Sens]
1 7	IN FIXEIS	is:		DO NOT INCIDIDE INVINING AIGAE OF INCIDENS. [F.A., F.K., INVV, INVV, OL., F.H., SDIW, SENS]
		<1% or none.	0	
		1-25% of the vegetated cover, in the AA or along its water edge (whichever has more).	0	
		25-50% of the vegetated cover, in the AA or along its water edge (whichever has more). 50-75% of the vegetated cover, in the AA or along its water edge (whichever has more).	0	
		>75% of the vegetated cover, in the AA or along its water edge (whichever has more).	0	
F10	Sphagnum Moss	The cover of Sphagnum moss (or any moss that forms a dense cushion many centimeters thick), including the moss obscured by taller		Exclude moss growing on trees and rocks. [CS, PH]
	Extent	sedges and other plants rooted in it, is:		
		<5% of the vegetated part of the AA.	1	
		5-25% of the vegetated part of the AA.	0	
		25-50% of the vegetated part of the AA. 50-95% of the vegetated part of the AA.	0	
		>95% of the vegetated part of the AA.	0	
F11	% Bare Ground &	Consider the parts of the AA that lack surface water at the driest time of the growing season. Viewed from directly above the ground layer, the		Thatch is dead plant material (stems, leaves) resting on the ground surface. Bare ground that is
	Thatch	predominant condition in those areas at that time is:		present under a tree or shrub canopy should be counted. Boulders count as bare ground. Wetlands
		Little or no (<5%) bare ground is visible between erect stems or under canopy anywhere in the vegetated AA. Ground is extensively blanketed by dense thatch, moss, lichens, graminoids with great stem densities, or plants with ground-hugging foliage.	1	with mineral soils and that are heavily shaded or are dominated by annual plant species tend to have more extensive areas that are bare during the early growing season. [AM, EC, INV, NR, OE, POL, PR, SBM, Sens]
		Slightly bare ground (5-20% bare between plants) is visible in places, but those areas comprise less than 5% of the unflooded parts of the AA.	0	
		Much bare ground (20-50% bare between plants) is visible in places, and those areas comprise more than 5% of the unflooded parts of the AA.	0	
		Other conditions.	0	
F12	Ground Irregularity	Not applicable. Surface water (either open or obscured by emergent plants) covers all of the AA all the time. Imagine the AA without any living vegetation. Excluding the portion of the AA that is always under water, the number of hummocks, small pils,	0	The depressions may be of human or natural origin. [AM, EC, INV, NR, PH, POL, PR, SBM, SR, WS]
1 12	Ground irregularity	integrate the PAY without any wing registration. Executing the potention of the PAY material among some water, the fundamental minimum and purpose, so that are raised mountage and part and purpose, minimum and purpose, minimum and purpose, minimum and purpose, minimum and purpose and part and purpose and		The depressions may be of numer of natural origin. [PW, EG, INV, INI, FT, FGE, FK, 30W, 31, W3]
		Few or none (minimal microtopography: <1% of the land has such features, or entire AA is always water-covered).	0	
		Intermediate.	0	
F12	Helendi I I	Several (extensive micro-topography).	1	TAM ND CDM
F13	Upland Inclusions	Within the AA, inclusions of upland are:		[AM, NR, SBM]
		Few or none.	0	
		Intermediate (1 - 10% of vegetated part of the AA). Many (e.g., wetland-upland "mosaic", >10% of the vegetated AA).	0	
F14	Soil Texture	many (e.g., wenand-upland mosaic, >10% of the vegetated AA). In parts of the AA that lack persistent water, the texture of soil in the uppermost layer is mostly: [To determine this, use a trowel to check in at	U	[CS, NR, OE, PH, PR, Sens, SFS, WS]
	Joil Texture	least 3 widely spaced locations, and use the soil texture key (in Appendix A of the Manual).]		[66] (11) 62] (11) (1) (30) (3) (3) (4)

		Little or none. Intermediate.	0	[AM, FA, FR, INV]
		Extensive.	0	
F40	Isolated Island	The AA contains (or is part of) an island or beaver lodge within a lake, pond, or river, and is isolated from the shore by water depths > 1 m on all sides during an average June. The island may be solid, or it may be a floating vegetation mat that is sufficiently large and dense to support a waterbird nest.	0	[WBN]
F41	Duckweed	Al some time of the year, mats of algae and/or duckweed are likely to cover >50% of the AA's otherwise-unshaded water surface, or blanket >50% of the underwater substrate. If true, enter "1" in next column. If untrue or uncertain, enter "0".	0	[EC, PR, WBF]
F42	Channel Connection & Outflow Duration	The most persistent surface water connection (outlet channel or pipe, dilct, or overbank water exchange) between the AA and a downslope stream network is; [Note: If the AA represents only part of a wetland, answer this according to whichever is the least permanent surface connection: the one between the AA and the rest of the wetland, or the surface connection between the wetland and the downslope stream network.] Persistent (surface water flows out for >9 months/year).	0	Consider the connection regardless of whether the surface water is frozen. The "downslope stream network" could consist of ditches, rivers, ponds, or lakes which eventually connect to the ocean. If this cannot be determined while visiting the AA, consult topographic maps perhaps by viewing these online with Toporama (http://atlas.nrcan.gc.ca/toporama/en/index.html) [CS, FA, FR, NR, OE, PR, Sens, SFS SR, WCv, WS]
		Seasonal (surface water flows out for 14 days to 9 months/year, not necessarily consecutive).	1	
		Temporary (surface water flows out for <14 days, not necessarily consecutive). None but maps show a stream network downslope from the AA and within a distance that is less than the AA's length. SKIP to F47 (pH	0	
		Measurement).		
		No surface water flows out of the wetland except possibly during extreme events (-once per 10 years). Or, water flows only into a wetland, ditch, or lake that lacks an outlet. SKIP to F47 (pH Measurement).	0	
F43	Outflow Confinement	During major runoff events, in the places where surface water exits the AA or connected waters nearby, the water:		"Major runoff events" would include biennial high water caused by storms and/or rapid snowmelt. [CS, NR, OE, PR, Sens, SR, STR, WS]
		Mostly passes through a pipe, culvert, narrowly breached dike, berm, beaver dam, or other partial obstruction (other than natural topography) that does not appear to drain the wetland artificially during most of the growing season.	0	
		Leaves through natural exits (channels or diffuse outflow), not mainly through artificial or temporary features.	1	
		Is exported more quickly than usual due to ditches or pipes within the AA or connected to its outlet, or within 10 m of the AA's edge, which drain the wetland artificially, or water is pumped out of the AA.	0	
F44	Tributary Channel	At least once annually, surface water from a tributary channel that is >100 m long moves into the AA. Or, surface water from a larger permanent water body adjacent to the AA spills into the AA. If it enters only via a pipe, that pipe must be fed by a mapped stream or lake further upslope. If no, SKIP to F47 (pH Measurement).	0	If inlet tributaries cannot be searched for due to inaccessibility of part of the AA, follow suggestions in F42 above. [NRv, PH, PRv, SRv]
F45	Input Water Temperature	Based on lack of shade, water source characteristics, or actual temperature measurements, the inflow is likely to be warmer than surface water in the AA during part of most years. Enter 1= yes, 0= no.	0	[WCv]
F46	Throughflow	During its travel through the AA at the time of peak annual flow, water arriving in channels: [select only the ONE encountered by most of the		[FA, FR, INV, NR, OE, PR, SR, WS]
	Resistance	incoming water]. Does not bump into many plant stems as it travels through the AA, Nearly all the water continues to travel in unvegetated (often incised)	0	
		channels that have minimal contact with welland vegetation, or through a zone of open water such as an instream pond or lake.	ŭ	
		Bumps into herbaceous vegetation but mostly remains in fairly straight channels.	0	
		Bumps into herbaceous vegetation and mostly spreads throughout, or is in widely meandering, multi-branched, or braided channels.	0	
		Bumps into tree trunks and/or shrub stems but mostly remains in fairly straight channels. Bumps into tree trunks and/or shrub stems and follows a fairly indirect path from entrance to exit (meandering, multi-branched, or braided).	0	
F47	pH Measurement	The pH in most of the AA's surface water:		Preferably, measure this in larger areas of ponded surface water within the AA, or in streams that have
		Was measured, and is: [enter the reading in the column to the right.]		passed through (not along) most of the AA. Unless surface water is completely absent, do not dig holes or make depressions in peat in order to provide water for this measurement. Avoid measuring near
		Was not measured but surface water is present and is darkly tea-coloured. Or if no surface water, then mosses and plants that indicate peatland (e.g., Labrador tea) are prevalent. Enter "1". Neither of above. Enter "1".	0	roads or in puddles formed only by recent rain. [AM, FA, FR, NR, WBF, PH, PR, Sens, WBF, WBN]
F48	TDS and/or Conductivity	The TDS (total dissolved solids) or conductivity off the AA's surface water is: (select the first true row with information):		See above for measurement guidance. [FR, INV, NRv, PH, PRv, Sens]
		TDS is: [Enter the reading in ppm or mg/L in the column to the right, if measured, or answer next row.] Conductivity is [Enter the reading in µS/cm in the column to the right.]		
		Was not measured, but plants that indicate saline conditions cover much of the vegetated AA. Enter "1".	0	
F49	Beaver Probability	Neither of above Use of the AA by beaver during the past 5 years is (select most applicable ONE):	1	[FA, FR, PH, SBM, Sens, WBF, WBN]
		Evident from direct observation or presence of gnawed limbs, dams, tracks, dens, lodges, or extensive stands of water-killed trees (snags).	1	
		Likely based on known occurrence in the region and proximity to suitable habitat, which may include: (a) a persistent freshwater wetland,	0	
		pond, or lake, or a perennial low or mid-gradient (<10%) channel, and (b) a corridor or multiple stands of hardwood trees and shrubs in vegetated areas near surface water.		
		Unlikely because site characteristics above are deficient, and/or this is a settled area or other area where beaver are routinely removed.	0	
F50	Groundwater Strength of Evidence	Select first applicable choice:		Adhere to these criteria strictly do not use personal judgment based on fen conditions, pH, or other evidence. Consult topographic maps to detect breaks in slope described here. Rust deposits
	or Evidence	Springs are known to be present within the AA, or if groundwater levels have been monitored, that has demonstrated that groundwater primarily discharges to the wetland for longer periods during the year than periods when the wetland recharges the groundwater.	0	evenence. Consult opposphism inspired better the early in super-essuation there. It was deposited associated with groundwater seeps may be most noticeable as orange discoloration in ice formations along streams during early winter. [AM, CS, FA, FR, INV, NR, OE, PH, PRv, SFS, WC, WS]
		Most of the AA has a slope of >5%, or is very close to the base of a natural slope longer than 100 and much steeper than the slope of the AA, AND the pH of surface water, if known, is >5.5.	0	
F51	Internal Gradient	Neither of above is true, although some groundwater may discharge to or flow through the AA. Or groundwater influx is unknown. The gradient along most of the flow path within the AA is:	1	This is not the same as the shoreline slope. It is the elevational difference between the AA's inlet and
		<2% or the AA has no surface water outlet (not even seasonally).	1	outlet, divided by the flow-distance between them and converted to percent. If available, use a clinometer to measure this. Free clinometer apps can be downloaded to smartphones. If the wetland is
		2-5%. 6-10%.	0	large (longer than -1 km), this may be estimated using Google Earth to determine the minimum and
		6-10%.	0	maximum elevation within the AA, then dividing by length and multiplying by 100. [CS, NR, OE, PR, SR, WBF, WBN, WS]

		0	
Cliffs or Steep Banks	In the AA or within 100 m, there are elevated terrestrial features such as cliffs, fatus slopes, stream banks, or excavated pris (but not riprap) that extend at least 2 m nearly vertically, are unvegetated, and potentially contain crevices or other substrate suitable for nesting or den areas. Enter 1 (yes) or 0 (no).	0	Do not include upturned trees as potential den sites. [POL, SBM]
New or Expanded Wetland	Human actions within or adjacent to the AA have persistently expanded a naturally occurring wetland or created a wetland where there previously was none (e.g., by excavation, impoundment):		Determine this using historical aerial photography, old maps, soil maps, or permit files as available [CS NR, OE, PH, Sens]
	No.		
			1
	Yes, but time of origin or expansion unknown.	0	
	Unknown if new or expanded within 20 years or not.	0	1
Burn History	More than 1% of the AA's previously vegetated area:		Look for charred soil or stumps (in multiple widely-spaced locations) or ask landowner. [CS, PH, STR]
	Burned within past 5 years.	0	1
	Burned 6-10 years ago.	0	1
	Burned 11-30 years ago.	0]
	Burned >30 years ago, or no evidence of a burn and no data.	1	
Visibility	The maximum percentage of the wetland that is visible from the best vanlage point on public roads, public parking lots, public buildings, or public maintained trails that intersect, adjoin, or are within 100 m of the AA (select one) is:		[PU, STR, WBFv]
	<25%.	0	
	25-50%.	0	
		1	TOLL AWAY
•	Assuming access permission was granted, select ALL statements that are true of the AA as it currently exists:		[PU, STR]
Potential	For an average person, walking is physically possible in (not just near) >5% of the AA during most of the growing season, e.g., free of deep water and dense shrub thickets.	1	
	Maintained roads, parking areas, or fool-trails are within 10 m of the AA, or the AA can be accessed part of the year by boats arriving via contiguous waters.	1	
	Within or near the AA, there is an interpretive center, trails with interpretive signs or brochures, and/or regular guided interpretive tours.	0	
Unvisited Core Area			[AM, FAv, FRv, PH, PU, SBM, STR, WBF, WBN]
			-
			1
	>95% of the AA with or without inhabited building nearby.	1	
Frequently Visited	The part of the AA visited by humans almost daily for several weeks during an average growing season probably comprises: [See note above.]		[AM, PH, PU, SBM, STR, WBF, WBN]
rica	<5%. If F60 was answered ">95%" (mostly never visited), SKIP to F64.	1	
	5-50%.	0	
	50-95%.	0	
	>95% of the AA.	0	
BMP - Soils	Boardwalks, paved trails, fences or other infrastructure and/or well-enforced regulations appear to effectively prevent visitors from walking on soil within nearly all of the AA when the soil is unfrozen. Enter *1* if true.	0	[PH, PU]
BMP - Wildlife Protection	Fences, observation blinds, platforms, paved trails, exclusion periods, and/or well-enforced prohibitions on motorised boals, off-leash pets, and off road vehicles appear to effectively exclude or divert visitors and their pets from the AA at critical times in order to minimize disturbance of wildlife (except during hunting seasons). Enter "1" if true.	0	[AM, PU, WBF, WBN]
Consumptive Uses	Recent evidence was found within the AA of the following potentially-sustainable consumptive uses. Select ALL that apply.		[FAv, FRv, WBFv]
(Provisioning Services)	Low-impact commercial timber harvest (e.g., selective thinning).	0	1
	Commercial or traditional-use harvesting of native plants, their fruits, or mushrooms.	0]
	Waterfowl hunting.	0]
	Fishing.	0	-
		0	
Domostic Walls		1	[NRv]
Domestic Wells			[tuve]
			-
		1	
Calcareous Fen	The AA is, or is part of, a calcareous fen. See the Plants. Calcar worksheet in the accompanying Supplinfo file for list of plant indicators	0	[PH, PR]
	(calciphiles). Enter 1 If more than two Strong or more than five Moderate calciphile species are present; otherwise enter 0, but if not able to		
	Buffer Slope Cliffs or Steep Banks New or Expanded Wetland Burn History Visibility Non-consumptive Uses - Actual or Potential Unvisited Core Area Erequently Visited Area BMP - Soils BMP - Wildlife Protection Consumptive Uses (Provisioning Services)	Series or many time persions districted part of managed vegotiation, ag, learn, one crops, uneversed road, die, laminidie. The sheepest and many time persions districted part of the updated area that is, within 30 m of the AA edge in other westands. 25%. essor (S) Data Form for Non-Ti	idal Wetlands. WESP-AC for New Bi	runswick. Version 2.		Dat
Aberrant Timing of Water Inputs				Dat
	s likely to have caused the timing of water inputs (but not necessarily their	ryaluma) to shift by hours, days, or wasks, becoming either more	mutad (cmallar or lace fraquent peaks enread over langer time	
	lashy (larger or more frequent spikes but over shorter times). [FA, FR, IN\		muteu (smailer of less frequent peaks spreau over longer time.	
Stormwater from impervious surfaces that drains directly to t	ne wetland.			1
Water subsidies from wastewater effluent, septic system leaf	kage, snow storage areas, or irrigation.			
Regular removal of surface or groundwater for irrigation or of	her consumptive use.			
Flow regulation in tributaries or water level regulation in adjo	ining water body, or other control structure at water entry points that regu	lates inflow to the wetland.		
	nt from the wetland that interferes with surface or subsurface flow in/ou	t of the AA (e.g., road fill, wellpads, pipelines).		
Excavation within the wetland, e.g., dugout, artificial pond, de	ead-end ditch.			
Artificial drains or ditches in or near the wetland.				(
	internal channel (incised below the historical water table level).			
Logging within the wetland.				
	sult of machinery, livestock, fire, drainage, or off road vehicles.			
Straightening, ditching, dredging, and/or lining of tributary ch		no mangurable offset on the timing of yeater conditions in any part of	of the AA then leave the "O's" for the season in the following round	
	ole below, assign points. However, if you believe the checked items had n ndition if the checked items never occurred or were no longer present.	o measurable effect on the liming of water conditions in any part o	il the AA, then leave the "US" for the scores in the following for	
	Severe (3 points)	Medium (2 points)	Mild (1 point)	
Spatial extent of timing shift within the wetland:	>95% of wetland.	5-95% of wetland.	<5% of wetland.	
When most of the timing shift began:	<3 yrs ago.	3-9 yrs ago.	10-100 yrs ago.	
Score the following 2 rows only if the altered inputs began wit	hin past 10 years, and only for the part of the wetland that experiences th	ose.		
Input timing now vs. previously:	Shift of weeks.	Shift of days.	Shift of hours or minutes.	
Flashiness or muting:	Became very flashy or controlled.	Intermediate.	Became mildly flashy or controlled.

Site Name:	Burchill Wind Energy Project - PH-W-02
Investigator Name:	Derrick Mitchell
Date of Field Assessment:	14 October 2019
Nearest Town:	Lorneville (west Saint John), New Brunswick
Latitude (decimal degrees):	45.202084
Longitude (decimal degrees):	-66.186590
Is a map based on a formal on-site wetland delineation available?	Yes
Approximate size of the Assessment Area (AA, in hectares):	8.7
AA as percent of entire wetland (approx.). Attach sketch map if AA is smaller than the entire contiguous wetland.	
What percent (approx.) of the wetland were you able to visit?	50
What percent (approx.) of the AA were you able to visit?	
Were you able to ask the site owner/manager about any of the questions?	
Indicate here if you intentionally surveyed for rare plants, calciphile plants, or rare animals	
Have you attended a WESP-AC training session? If so, indicate approximate month & year	
How many wetlands have you assessed previously using WESP-AC? (approx.)	
Comments about the site or this WESP-AC assessment (attach extra page if desired):	

Form OF (Office). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Conduct an assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answering many of the questions below will equire using these online map viewers:

Google Earth Pro: https://www.google.com/earth/download/gep/agree.html

GeoNB: http://www.snb.ca/geonb1/ and http://www.snb.ca/geonb1/e/apps/apps-E.asp

Geons: http://www.snb.ca/geonol/ and http://www.snb.ca/geonol/e/apps/apps/apps-ta-asp For most wetlands, completing this office data form will require 1-2 hours. For a list of functions to which each question pertains, see bracketed abbreviations in the Definitions/Explanations column. For detailed descriptions of each WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity,

)F1	Indicators	Condition Choices	Data	Definitions/Explanations
r i	Province	Mark the province in which the AA is located by changing the 0 in the column next to it to a "1". Mark only one.		This determines to which province's calibration wetlands the raw score of any wetland is normalise
		New Brunswick	1	In the function and benefits models, it also triggers the automatic exclusion of indicators for which spatial data exists in a particular province.
		Nova Scotia	0	spatial data exists in a particular province.
		Prince Edward Island	0	1
		Newfoundland-Labrador	0	1
2	Ponded Area Within 1 km.	The area of surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) within 1 km is:		"Adjacent" means not separated from the AA by a wide expanse (>50 m) of upland (including roa >50 m wide). Include ponded areas likely to be hidden by wetland vegetation. If surface water
		<0.01 hectare (about 10 m x 10 m).	1	extends beyond 1 km, include only the part within 1 km. Do not include tidal areas. Measure the
		0.01 - 0.1 hectare.	0	from aerial imagery using Google Earth Pro (click on Ruler icon in toolbar, then Polygon in pop-up
		0.1 - 1 hectare.	0	menu). With the GeoNB viewer, enable the Wetlands layer, then measure with the Draw & Meass tool after specifying Aerial as the Basemap. However, do not rely entirely on wetland boundaries
		1 to 10 hectares.	0	shown in online wetlands layers. [PH, SBM, WBN]
		10 to 100 hectares.	0	
		>100 hectares.	0	1
3	Ponded Water & Wetland Within 1 km.	The area of wetlands and surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) within 1 km is:	n	See definition of adjacent in OF2. If the AA's wetland vegetation extends beyond 1 km, include o the part within 1 km. "Ponded" means not flowing in rivers or streams. [Sens, WBF]
		<0.01 hectare (about 10 m x 10 m).	0	1
		0.01 - 0.1 hectare.	0	1
		0.1 - 1 hectare.	0	1
		1 to 10 hectares.	0	1
		10 to 100 hectares.	0	1
		>100 hectares.	1	
4	Size of Largest Nearby Vegetated Tract or	The largest vegetated patch or corridor that includes the AA's vegetation plus albdjacent upland vegetation that is not lawn, row crops, heavily grazed lands, conifer plantation is:		See definition of adjacent in OF2. Use Google Earth Pro's polygon ruler (as described above). Exclude conifer plantations only if it is obvious that trees were planted in rows. [AM, PH, SBM, Se
	Corridor	<0.01 hectare (about 10 m x 10 m).	0	
		0.01 - 0.1 hectare.	0	
		0.1 - 1 hectare.	0	
		1 to 10 hectares.	0	
		10 to 100 hectares.	0	
		100 to 1000 hectares.	1	
		>1000 hectares. [This is nearly always the answer in relatively undeveloped landscapes]	0	
5	Distance to Large Vegetated Tract	The minimum distance from the edge of the AA to the edge of the closest vegetated land (but excluding row crops, lawn, conifer plantation) larger than 375 hectares (about 2 km on a side), is:		To measure distance, use Google Earth Pro (Ruler > Line tool). Or use Draw & Measure tool at GeoNB. The 375-ha criterion is from the Fundy Model Forest Project. [AM, PH, POL, SBM, Sens
		-50 m, and not separated from the 375-ha vegetated area by any width obaved roads, stretches of open water, row crops, bare ground, lawn, or impervious surface. Or the AA itself contains >375 ha of vegetation. [This is often the answer in relatively undeveloped landscaped to the contains of the con	1	
		<50 m, but completely separated from the 375-ha vegetated area by those features, and AA does not contain >375 ha of vegetation.	0	
		50-500 m, and not separated.	0	1
		50-500 m, but separated by those features.	0	1
		0.5 - 5 km, and not separated.	0	
		0.5 - 5 km, but separated by those features.	0	
		None of the above (the closest patches or corridors which are that large are >5 km away).	0	
6	Herbaceous Uniqueness	The AA's vegetation cover is >10% herbaceous* but uplands within 5 km have <10% herbaceous cover. If so, enter "3" and continue to OF7. If not, consider: The AA's vegetation cover is >10% herbaceous* but uplands within 1 km have <10% herbaceous cover. If so enter "2" and continue to OF7. If not, consider: The AA's vegetation cover is >10% herbaceous* but uplands within 100 m of the wetland edge have <10% herbaceous cover. If so, enter "1". If NOTE: Exclude lawns, row crops, heavily grazed lands, forest, shrublands. Include moss as well as grassilike plants in this use of "herbaceous vegetation"]	0	For this question only, consider moss to be herbaceous vegetation. Determine the score by view areal imagery in Google Earth after successively drawing or estilianting the boundaries of the but of 5 km, 1 km, and 100 m radius focused on the center of the AA. Circles of specified radius can drawn in Google Earth Pro by clicking on the Ruler icon, then Circle in the pop-up menu. [AMv, F POLv, SBMv, WBFv, WBNv]
7	Woody Uniqueness	The AA's vegetation cover is >10% woody" but uplands within 5 km have <10% woody cover. If so, enter "3" and continue to OF8. If not,	0	See above. Do not consider conifer plantations to be forest if it is obvious that trees were planted
		consider: The AAI's vegetation is >10% woody* but uplands within 1 km have <10% woody cover. If so enter "2" and continue to OF8. If not, consider:		rows. [AMv, PHv, POLv, SBMv]
		The AA's vegetation is >10% woody" but uplands within 100 m of the wetland edge have <10% woody cover. If so, enter "1" [" NOTE: woody cover = trees & shrubs taller than 1 m.]		
8	Local Vegetated Cover Percentage	Draw a 5-km radius circle measured from the center of the AA. Ignoring all permanent water in the circle, the percent of the remaining an that is wooded or unmanaged herbaceous vegetation (NOT lawn, row crops, bare or heavily grazed land, clearcuts, or confler plantations is:		In Google Earth, draw the 5 km buffer and then estimate land cover percentages, or do GIS analy of an appropriate land cover layer. In Google Earth, click on the Ruler icon, then Path, and draw and measure the route. Or use the GeoNB's Draw & Measure tool> Freehand Line to draw and measure the route Settlements (click on Place Names in menu) or other areas not close to mapped settlements but

OF11	Distance to Nearest	From the center of the AA, the distance to the nearest maintained public road (dirt or paved) is:		Determine this by viewing aerial imagery in Google Earth and measuring with the Ruler>Line tool. Or
	Maintained Road	<10 m.	0	use the GeoNB's Draw Line tool. [AM, FAv, FRv, NRv, PH, PU, SBM, STR, WBN]
		10 - 25 m.	0	
		25 - 50 m.	0	
		50 - 100 m.	0	
		100 - 500 m. >500 m.	0	
OF12	Wildlife Access	Draw a circle of radius of 5 km from the center of the AA. If mammals and amphibians can move from the center of the AA to ALL other	U	In NB, enable the Wetlands layer in GeoNB (despite its omissions) to show surrounding wetlands and
01.12	VIIIdillo Fideess	separate wetlands and ponds located within the circle without being forced to cross pavement (any width), lawns, bare ground, and/or marine waters, mark 1 = yes can move to all, 0 = no. Change toblank if there are no other wetlands within 5 km.	0	roads, while estimating the location of the 5 km circle (or draw the 5 km circle in Google Earth Pro using the Circle tool and compare). Evaluate using Google Earth, being cautious to search for roads hidden under forest canopy. [AM, SBM, STR]
OF13	Distance to Ponded	The distance from the AA center to the closest (but separate) ponded water body visible in GoogleEarth imagery is:		in Google Earth, zoom in closely to examine the surrounding landscape for ponds, lakes, and
	Water	<50 m, and not separated by any width of paved roads, stretches of open water, row crops, lawn, bare ground, or impervious surface.	0	wellands that appear to be permanently flooded. Enable the GeoNB viewer's Wetlands layer as wel [AM, PH, SBM, Sens, WBF, WBN]
		<50 m, but completely separated by those features.	0	
		50-500 m, and not separated. 50-500 m, but separated by those features.	0	
		0.5 - 1 km. and not separated by those readules.	0	
		0.5 - 1 km, but separated by those features.	0	
		None of the above (the closest patches or corridors that large are >1 km away).	0	
OF14	Distance to Large Ponded Water	The distance from the AA center to the closest (but separate)non-tidal body of water that is ponded during most of the year and islarger than 8 hectares during most of a normal year is:		Determine this by viewing aerial imagery in Google Earth. [Sens, WBF, WBN]
		<100 m.	0	
		100 m - 1 km.	1	
		1 -2 km.	0	
		2-5 km.	0	
		5-10 km.	0	
OE15	Tidal Provimity	>10 km. The distance from the AA edge to the eleccettidal water body (regardless of its calinity) is:	0	In Congle Earth, measure the distance to the opens (including Day of Funds) or tidal the substitute of
OF15	Tidal Proximity	The distance from the AA edge to the closesttidal water body (regardless of its salinity) is:		In Google Earth, measure the distance to the ocean (including Bay of Fundy) or tidal river, whichever is closer. If you need to see how far upriver a river is tidal, see the KMZ file provided with this
		<100 m.	0	calculator for NB (NB Headtide). Points shown in those files are only an approximation, so local
		100 m - 1 km. 1 - 5 km.	0	information if available may be preferable. [FA, WBF]
		5-10 km.	0	
		10-40 km.	0	
		>40 km.	0	
OF16	Upland Edge Contact	Select one:		[NR, SBM, Sens]
		The AA has no upland edge (or upland is <1% of perimeter). The AA is entirely surrounded by (& contiguous with) other wetlands or water	0	
		1-25% of the AA's perimeter abuts upland (including filled areas). The rest adjoins other wetlands or water that is mostly wider than the AA	0	
		25-50% of the AA's perimeter abuts upland. The rest adjoins other wetlands or water that is mostly wider than the AA.	0	
		50-75% of the AA's perimeter abuts upland. The rest adjoins other wetlands or water that is mostly wider than the AA. More than 75% of the AA's perimeter abuts upland. Any remainder adjoins other wetlands or water that is mostly wider than the AA.This	0	
		will be true for most assessments done with WESP-AC.	'	
OF17	Flood Damage from Non-	Within 5 km downstream or downslope of the AA (select first true choice):		In the GeoNB map viewer: click on "More" in upper right, then "Flood Information". Expand the menu
	tidal Waters	Maps show Flood Zone or Flood Risk areas and there appears to be infrastructure vulnerable to river flooding not caused by tidal storm surges.	0	under it by clicking on the arrow to its left and the slider to its right. Uncheck the first (Limits of Data) box. Where available, LiDAR imagery can provide finer elevational resolution useful for flood modeling, (WSv)
		Maps show Flood Zone or Flood Risk areas, but infrastructure is absent or is not vulnerable to floods from a non-lidal river. In some cases levees, upriver dams, or other measures may partly limit damage or risk from smaller events.	0	modeling. [1004]
		Maps do not show Flood Zone or Flood Risk areas (or no such mapping has been done locally) and there appears to be infrastructure vulnerable to river flooding unrelated to tidal storm surges.	0	
OF18	Relative Elevation in	Maps do not show Flood Zone or Flood Risk areas (or no such mapping has been done locally) and there i no infrastructure vulnerable to river flooding unrelated to tidal storm surges. In Google Earth, enable the Terrain layer (lower left menu) and open the NB_Watersheds KMZ file that accompanies this calculator. Then		IFA NR, Sens, SFSv, WCv, WSv/
	Watershed	determine the AA's approximate elevation (bottom right, NOT the "eye alt"). Then move cursor around to determine the watershed's maximum and minimum elevation. Divide the AA's elevation by the (max-min).	0.70	
	Water Quality Sensitive Watershed or Area	In Google Earth, open the KMZ file NB_Watershed Protected Area which accompanies this calculator. The AA is within such an area. Enter 1 = yes, 0 = no. Enter 2 = yes, 0 = no.	0	If an ACCDC report is available for this AA, it also may contain such information. [NRv]
OF20	Degraded Water Upstream	Sampling indicates a problem with concentrations ofmetals, hydrocarbons, nutrients, or other substances (excluding bacteria, acidic water, high temperatures) being present at levels harmful to aquatic life or humans, and:		May use existing data, or sample those waters as part of this wetland assessment. "Harmful" should be evaluated with regard to current federal or provincial water quality standards. [AM, FA, FR, NRv,
		The condition is present within the AA.	0	PRv, SRv, STR, WBF, WBN]
		The condition is present in waters within 1 km that flowinto the AA, but has not been documented in the AA itself.	0	
		Sampling during both low water periods and times with high runoff (storms, snowmelt) indicates no problems in either the AA or inflowing waters.	0	
		Data are insufficient (no or inadequate sampling within 1 km, or condition exists only at >1 km upstream)This is the situation for nearly all wetlands in this region.	1	
OF21	Degraded Water	The problem described above is downslope from the AA, and:		May use existing data, or monitor waters as part of this wetland assessment. [NRv, PRv, SRv]
	Downstream	The condition is present within 1 km downslope and connected to the AA by a channel.	0	
		The condition is present within 5 km downslope and connected to the AA by a channel, or within 1 km but not connected to the AA by a	0	
		channel. Sampling during both low water periods and times with high runoff (storms, snowmelt) indicates no problems in either the AA or inflowing	0	
		waters. Data are insufficient (no or inadequate sampling within 1 km, or condition exists only at >1 km upstream)This is the situation for nearly	1	
0.5		all wetlands in this region.		
OF22	Wetland as a % of Its Contributing Area (Catchment)	From a topographic map and field observations, estimate the approximate boundaries of the catchment (CA) of the entire wetland of which the AI may be only a part. Then adjust those boundaries if necessary based on your field observations of the surrounding terrain, and/or tusing procedures described in the Manual. Divide the area of the wetland (not just the AA) by the approximate area of its catchment excluding the area of the wetland itself. When doing the calculation, if ponded water is adjacent to the wetland, include that in the wetland area. The result is:		Topographic maps may be viewed online at the National Allas of Canada (Toporama): http://atlas.gc.ca/loporama/en/index.html [NR, PR, Sens, SR, WS]
		<0.01, or calchment size unknown due to stormwater pipes that collect water from an indeterminate area.	0	
		0.01 to 0.1.	0	
		0.1 to 1.	0	
OF23	Unvegetated Surface in	31 (wetland is larger than its catchment (e.g., wetland with flat surrounding terrain and no inlet, or is entirely isolated by dikes, or is a raised toog). The proportion of the AA's contributing area (measured to no more than 1000 m upslope) that is comprised of buildings, roads, parking lots	U	[FA, INV, NRv, PRv, SRv, STR, WCv, WSv]
	the Contributing Area	other payement, exposed bedrock, landslides, and other mostly-bare surface is about : <10%.	1	g
		10 to 25%.	0	
		>25%.	0	

DF24		_		
	Transport From Upslope	A relatively large proportion of the precipitation that falls farther upslope in the CA reaches this wetland quickly as runoff (surface water), as		[NRv, PRv, SRv, WSv]
		indicated by the following:		
		(a) input channel is present,		
		(b) input channels have been straightened,		
		(c) upslope wetlands have been ditched extensively, (d) land cover is mostly non-forest,		
		(e) CA slopes are steep, and/or		
		(f) most CA soils are shallow (bedrock near surface) and/or have high runoff coefficients.		
		This statement is:		
		Mostly true.	0	
		Somewhat true.	0	
			0	
		Mostly untrue.	1	
OF25	Aspect	The overland flow direction of most surface water (in streams, rivers, or runoff) that enters the AA is:		[AM, NR, SFS, WC, WS]
		Northward (N, NE). north-facing contributing area.	0	
		7. 7 5	1	
		Southward (S, SW), south-facing contributing area.		
		Other (E, SE, W, NW), or no detectable uphill slope or input channel (flat).	0	
	Internal Flow Distance	The horizontal flow distance from the wetland's inlet to outlet is:		Identify inlets and outlets, if any, from topographic maps (use elevations to determine which are inlet
	(Path Length)	<10 m.	0	and which are outlets) and augment by field inspection. [NR, OE, PR, SR, WS]
		10 - 50 m.	0	
		50 - 100 m.	0	
		100 - 1000 m.	1	
		1- 2 km.	0	
		>2 km, or wetland lacks an inlet and outlet.	0	
OF27	Growing Degree Days	In Google Earth, open the KMZ file that accompanies this calculator, called NB-PEI_GrowingDegreeDays. Place your cursor over the AA		This layer was provided by Dr. Dan McKenney of the Canadian Forest Service [AM, CS, FR, INV,
		and left-click. From the pop-up, enter the GRIDCODE in the next column.	2428	NR, OÉ, PH, PR, Sens, SR, WBF, WCv, WS
OF28	Fish Access or Use	According to agency biologists and/or your own observations, the AA. [Nark just the first choice that is true.]:		Regarding the last choice, if uncertain if an AA is fishless, consider the possibility its waters have be stocked. In NB, the list of stocked waters is at:
		Is known to support rearing and/or spawning by Atlantic salmon or other anadromous species or eels. In NB, consult Figure A-2 in	0	http://www2.gnb.ca/content/gnb/en/departments/erd/natural_resources/content/fish/content/Stocked
		Appendix A of the Manual. Contact local fishery biologists, review the ACCDC report, and visit these websites:	l	nttp://www.z.gnb.ca/content/gnb/en/departments/erd/natural_resources/content/its/vcontent/stocked aters.html
		http://www.salmonatlas.com/atlanticsalmon/canada-east/index.1.html http://atlanticsalmonfederation.org/rivers/introduction.html		[AM, FA, FR, INV, WBF, WBN]
		Has not been documented to support Atlantic salmon rearing and/or spawning, but is connected to nearby waters likely to contain Atlantic	0	n i i i i i i i i i i i i i i i i i i i
		salmon or other anadromous species or eels and is probably accessed by those during some conditions.		
		Is probably is not accessed by any anadromous fish species but is known or likely to hav other fish at least seasonally.	0	
		Is known or likely to be fishless (e.g., too small, dry, and/or not accessible even temporarily, and not stocked).	1

Date: 14 October 2019 Site Identifier: PH-W-02 Investigator: Derrick Mitch

Form F (Field). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Walk for no less than 10 minutes from the wetland edge towards its core, in the part of the AA that is proposed for alteration. If no alteration is proposed, walk in a portion that appears to be most representative of the wetland overall. Walk only where it is safe and legal to do so. Conduct the assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answer these questions primarily based on your onsite observations and interpretations. Do not write in shaded parts of this data form. Answering some questions accurately may require conferring with the landowner or other knowledgable persons and/or reviewing aerial imagery. For most wetlands, completing this field data form will require 1-2 hours on a site. For a list of functions to which each question pertains, see the accompanying Interpretations form. For detailed descriptions of each WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage & Delay, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity, STR= Stressors.

#	Indicators	Condition Choices	Data	Definitions/Explanations
F1	Wetland Type	Follow the key below and mark the ONE row that best describes MOST of the vegetated part of the AA:		Ericaceous shrubs are ones in the heather family (Ericaceae). Most have leathery evergreen leaves. They include rhododendron, azalea, swamp laurel, leatherleaf, Labrador tea, and others. Most require acidics soil. Although not in the family Ericaceae, sweetgale (<i>Myrica gale</i>) should be counted also. [AM, CS, FA, FR, INV, NR, OE, PH, Sens, SFS, WBF, WBN]
		A. Moss and/or lichen cover more than 25% of the ground. Often dominated by ericaceous shrubs (e.g., Labrador tea) or other acid-tolerant plants (e.g., bog cranberry, pitcher plant, sundew, orchids). Substrate is mostly undecomposed peat. Choose between A1 and A2 and mark the choice with a 1 in their adjoining column. Otherwise go to B below.		
		A1. Surface water is usually absent or, if present, pH is typically <4.5 and conductivity is usually <100 µS/cm (<64 ppm TDS). Trees are absent or nearly so. Sedge cover usually sparse or absent but cottongrass and/or lichen cover may be extensive, as well as cloudberry, lingonberry, sheep laurel, and a sedge (Carex rarillora). Weltland surface and surrounding landscape are seldom sloping and welfand often is domed (convex). Inlet and outlet channels are usually absent. If known, pH of peat is <4.0.	0	
		A2. Not A1. Surface water, if present, has pH typically >4.5 and conductivity is usually >100 µS/cm (>64 ppm TDS). Sedge cover is usually extensive, and/or tree and tall shrub cover is extensive. Sometimes at toe of slope or edge of water body. An exit channel is usually present. Wetter than A1 and peat depth may be shallower (<2 m).	0	
		B. Moss and/or lichen cover less than 25% of the ground. Soil is mineral or decomposed organic (muck). Choose between B1 and B2 and mark the choice with a 1 in their adjoining column:		
		B1. Trees and shrubs taller than 1 m comprise more than 25% of the vegetated cover. Surface water is mostly absent or inundates the vegetation only seasonally (e.g., vernal pools or floodplain).	1	
		B2. Not B1. Tree & tall shrubs comprise less than than 25% of the vegetated cover. Vegetation is mostly herbaceous, e.g., cattail, bufush, burreed, pond lily, horsetail. Surface water may be extensive and fluctuates seasonally, being either persistent or drying up partly or entirely.	0	
AA shi include " adja e descrii	ould also include part of a e the open water part adj cent " is used synonymo bed features along their a	he AA should include all persistent waters in ponds smaller than 8 hectares (-283 m on a side) that are adjacent to the AA. The the water area of adjacent ponded water larger than 8 ha and adjacent rivers wider than 20 m. Specifically, the AA should facent to wetland vegetation and equal in width to the average width of that vegetated zone. Throughout this dat form, usly with abutting, adjoining, bordering, contiguous and means no upland (manmade or natural) completely separates the directly shared edge. Features joined only by a channel are not necessarily considered to be adjacent a large portion of their es do not have to be hydrologically connected in order to be considered adjacent.		
F2	Wetland Types - Adjoining or Subordinate	If the AA is smaller than 1 ha, mark all other types that occupy more than 1% of the vegetated AA. If the AA is larger than 1 ha, mark all other types which are within or adjacent to the AA and occupy more than 1 ha, as visible from the AA or as interpreted from aerial imagery. Do not mark again the type marked in F1.		1 hectare is 10,000 sq. m or about 2.5 acres. It could have dimensions of 100 m by 100 m, 1000 m by 10 m, or similar. [AM, INV, SBM, WBF]
		A1. A2.	0	
		B1. B2.	0	
F3	Woody Height & Form Diversity	DZ. Following EACH row below, indicate with a number code the percentage of the living vegetation in the AA which is occupied by that feature (6 if >95%, 5 if 75-95%, 4 if 50-75%, 3 if 25-50%, 2 if 5-25%, 1 if <5%, 0 if none). If the vegetated part of the AA is largely herbaceous (non-woody) vegetation, these percentages should not sum to 100%.		Deciduous shrubs in this region usually include buttonbush, Labrador tea, bayberry (Morella), huckleberry, cranberry, cloudberry, sweetglale, alder, willow, birch, ash, dogwood, and a few others. If you assigned a code of 3 or higher to any of the first four choices and the ground cover beneath the trees/shrubs is <25% moss, then question F1 might be "B1". [CS, INV, NR, PH, POL, SBM, Sens]
		coniferous trees (may include tamarack) taller than 3 m. deciduous trees taller than 3 m.	5	
		coniferous or ericaceous shrubs or trees 1-3 m tall not directly below the canopy of trees.	1	
		deciduous shrubs or trees 1-3 m tall not directly below the canopy of trees. coniferous or ericaceous shrubs <1 m tall not directly below the canopy of taller vegetation.	2	
		deciduous shrubs or trees <1 m tall (e.g., deciduous seedlings) not directly below the canopy of taller vegetation.	2	
<u>Note</u> :		F3 was marked 2 or greater , SKIP to F9 (N fixers).		
F4	Dominance of Most Abundant Shrub	Determine which two woody plant species comprise the greatest portion of the low (<3 m) woody cover . Then choose one: those species together comprise > 50% of such cover.	0	[PH, POL, SBM, Sens]
	Species	those species together do not comprise > 50% of such cover.	1	
F5	Woody Diameter Classes	Mark ALL the types that comprise >5% of the woody canopy cover in the AA or >5% of the wooded areas (if any) along its upland edge (perimeter). The edge should include only the trees whose canopies extend into the AA.		Estimate the diameters at chest height. If small-diameter trees are overtopped (shaded) by larger ones, visualise a "subcanopy" at the average height of the smaller-dbh trees, to serve as a basis for the minimum 5% canopy requirement in this question. The trees and shrubs need not be welland species. [AM, CS, POL, SBM, Sens, WBN]
		coniferous, 1-9 cm diameter and >1 m tall.	1	
		broad-leaved deciduous 1-9 cm diameter and >1 m tall. coniferous, 10-19 cm diameter.	1	
		broad-leaved deciduous 10-19 cm diameter.	1	
		coniferous, 20-40 cm diameter.	1	
		broad-leaved deciduous 20-40 cm diameter. coniferous, >40 cm diameter.	1	
		broad-leaved deciduous >40 cm diameter.	0	
F6	Height Class Interspersion	Follow the key below and mark the ONE row that best describes MOST of the AA: A. Neither the vegetation taller than 1 m nor the vegetation shorter than that comprise >70% of the vegetated part of the AA. They each comprise 30-70%. Choose between A1 and A2 and mark the choice with a 1 in the adjoining column. Otherwise go to B below.		[AM, INV, NR, PH, SBM, Sens]
		A1. The two height classes are mostly scattered and intermixed throughout the AA.	0	
		A2. Not A1. The two height classes are mostly in separate zones or bands, or in proportionately large clumps. B. Either the vegetation shorter than 1 m comprises >70% of the vegetated part of the AA, or the vegetation taller than that does. One size	1	
		class might even be totally absent. Choose between B1 and B2 and mark the choice with a 1 in the adjoining column: B1. The less prevalent height class is mostly scattered and intermixed within the prevalent one.	0	
		B2. Not B1. The less prevalent height class is mostly located apart from the prevalent one, in separate zones or clumps, or is completely absent.	0	
F7	Large Snags (Dead Standing Trees)	The number of large snags (diameter >20 cm) in the AA plus adjacent upland area within 10 m of the wetland edge is: None, or fewer than 8/ hectare which exceed this diameter.	_	Snags are dead standing trees that often (not always) lack bark and foliage. Include only ones that are at least 2 m tall. [POL, SBM, WBN]
		None, or tewer than 8/ hectare which exceed this diameter. Several (>8/hectare) and a pond, lake, or slow-flowing water wider than 10 m is within 1 km.	0	
		Several (>8/hectare) but above not true.	1	
F8	Downed Wood	The number of downed wood pieces longer than 2 m and with diameter >10 cm, and not persistently submerged, is:		Exclude temporary "burn piles." [AM, INV, POL, SBM]
		Few or none that meet these criteria.	0	
		Several (>5 if AA is >5 hectares, less for smaller AAs) meet these criteria.	- 1	

FieldF form - Non-tidal Page 1 of 5

FQ	N Fixers	The percentage of the AA's vegetated cover that contains nitrogen-fixing plants (e.g., alder, sweetgale, clover, lupine, alfalfa, other legumes)		Do not include N-fixing algae or lichens. [FA, FR, INV, NRv, OE, PH, SBM, Sens]
1 7	IN FIXEIS	is:		Do not include Nitking aigae of lichens. [FA, FR, HVV, HVV, OE, FH, Sbin, Sens]
		<1% or none.	0	
		1-25% of the vegetated cover, in the AA or along its water edge (whichever has more).	1	
		25-50% of the vegetated cover, in the AA or along its water edge (whichever has more). 50-75% of the vegetated cover, in the AA or along its water edge (whichever has more).	0	-
		>75% of the vegetated cover, in the AA or along its water edge (whichever has more).	0	1
F10	Sphagnum Moss	The cover of Sphagnum moss (or any moss that forms a dense cushion many centimeters thick), including the moss obscured by taller		Exclude moss growing on trees and rocks. [CS, PH]
	Extent	sedges and other plants rooted in it, is:		
		<5% of the vegetated part of the AA.	0	
		5-25% of the vegetated part of the AA. 25-50% of the vegetated part of the AA.	0	-
		50-95% of the vegetated part of the AA.	0	
		>95% of the vegetated part of the AA.	1	
F11	% Bare Ground &	Consider the parts of the AA that lack surface water at the driest time of the growing season. Viewed from directly above the ground layer, the		Thatch is dead plant material (stems, leaves) resting on the ground surface. Bare ground that is
	Thatch	predominant condition in those areas at that time is:		present under a tree or shrub canopy should be counted. Boulders count as bare ground. Wetlands with mineral soils and that are heavily shaded or are dominated by annual plant species tend to have
		Little or no (<5%) bare ground is visible between erect stems or under canopy anywhere in the vegetated AA. Ground is extensively blanketed by dense thatch, moss, lichens, graminoids with great stem densities, or plants with ground-hugging foliage.	1	more extensive areas that are bare during the early growing season. [AM, EC, INV, NR, OE, POL, PR, SBM, Sens]
		Slightly bare ground (5-20% bare between plants) is visible in places, but those areas comprise less than 5% of the unflooded parts of the	0	
		Much bare ground (20-50% bare between plants) is visible in places, and those areas comprise more than 5% of the unflooded parts of the AA	0	
		Other conditions.	0	1
		Not applicable. Surface water (either open or obscured by emergent plants) covers all of the AA all the time.	0	
F12	Ground Irregularity	Imagine the AA without any living vegetation. Excluding the portion of the AA that is always under water, the number of hummocks, small pits,		The depressions may be of human or natural origin. [AM, EC, INV, NR, PH, POL, PR, SBM, SR, WS]
		raised mounds, animal burrows, ruts, guilles, natural levees, microdepressions, and other areas of peat or mineral soil that are raised or depressed >10 cm compared to most of the area within a few meters surrounding them is:		
		Few or none (minimal microtopography; <1% of the land has such features, or entire AA is always water-covered).	0	
		Intermediate. Several (extensive micro-topography).	0	1
F13	Upland Inclusions	Several (extensive micro-lopography). Within the AA, inclusions of upland are:	U	[AM, NR, SBM]
	opianu inclusions	Few or none.	1	
		Few or none. Intermediate (1 - 10% of vegetated part of the AA).	0	1
		Many (e.g., wetland-upland "mosaic", >10% of the vegetated AA).	0	1
F14	Soil Texture	In parts of the AA that lack persistent water, the texture of soil in the uppermost layer is mostly: [To determine this, use a trowel to check in at		[CS, NR, OE, PH, PR, Sens, SFS, WS]
		least 3 widely spaced locations, and use the soil texture key (in Appendix A of the Manual).]		
		Loamy: soils that may contain a little fine grit and do not make a "ribbon" longer than 2 cm when moistened, rolled, squeezed, and extended between thumb and forefinger.	0	
		Fines: includes silt, clay, silt, soils that make a ribbon longer than 2 cm when moistened, rolled, squeezed, and extended between thumb and	0	1
		forefinger.		
		Deep Peat, to 40 cm depth or greater.	0	
		Shallow Peat or organic <40 cm deep. Coarse: includes sand, loamy sand, gravel, cobble, soils that do not make a ribbon when moistened, rolled, squeezed, and extended	0	
		between thumb and forefinger.	Ŭ	
F15	Shorebird Feeding	During any 2 consecutive weeks of the growing season, the extent of mudflats, bare unshaded saturated areas not covered by thatch, and		This addresses needs of many but not all migratory sandpipers, plovers, and related species. [WBF]
	Habitats	unshaded waters shallower than 6 cm is: [Include also any area that is adjacent to the AA.] None, or <100 sq. m.	- 1	
		100-1000 sq. m.	0	
		1000 – 10,000 sq. m.	0	1
		>10,000 sq. m.	0	
F16	Herbaceous % of	In aerial ("ducks eye") view, the maximum annual cover of herbaceous vegetation (all non-woody plants except moss) is:		[AM, WBF, WBN]
	Vegetated Wetland	<5% of the vegetated part of the AA or <0.01 hectare (whichever is less). Mark "1" here and SKIP to F20 (Invasive Plant Cover).	0	
		5-25% of the vegetated part of the AA.	0	
		25-50% of the vegetated part of the AA. 50-95% of the vegetated part of the AA.	0	-
		>95% of the vegetated part of the AA.	0	1
F17	Forb Cover	Within parts of the AA having herbaceous cover (excluding SAV), the areal cover of forbs reaches an annual maximum of:		Forbs are flowering plants. Do not include grasses, sedges, cattail, other graminoids, ferns, horsetails,
		<5% of the herbaceous part of the AA.	0	or others that lack showy flowers. [POL]
		5-25% of the herbaceous part of the AA.	1	
		25-50% of the herbaceous part of the AA.	0	
		50-95% of the herbaceous part of the AA.	0	-
F18	Sedge Cover	>95% of the herbaceous part of the AA. Sedges (Carex spp.) and cottongrass (Eriophorum spp.) occupy:	0	[CS]
	Scage cover	Scages (carea spe), and contingues (<i>Engineral a spe)</i> , occapy. <5% of the vegelated area, or none.	0	
		<5% of the vegetated area, or none. 5-50% of the vegetated area.	1	
		50-95% of the vegetated area.	0	1
		>95% of the vegetated area.	0	
F19	Dominance of Most	Determine which two herbaceous species comprise the greatest portion of the herbaceous cover (excluding mosses and floating-leaved		For this question, include ferns as well as graminoids and forbs. [EC, INV, PH, POL, Sens]
	Abundant Herbaceous Species	aquatic plants). Then choose one of the following: those species together comprise > 50% of the areal cover of herbaceous plants at any time during the year.	0	1
		those species together do not comprise > 50% of the areal cover of herbaceous plants at any time during the year.	1	
F20	Invasive Plant Cover	How extensive is the cover of invasive plant species in the AA? For species, see Plants_invasive worksheet in the accompanying Supplnfo		[EC, PH, POL, Sens]
		file.	_	
		invasive species appear to be absent in the AA, or are present only in trace amount (a few individuals). Invasive species are present in more than trace amounts, but comprise <5% of herbaceous cover (or woody cover, if the invasives are	0	
		invasive species are present in more man trace amounts, but comprise <5% or nerbaceous cover (or woody cover, it the invasives are woody).	1	
		invasive species comprise 5-20% of the herb cover (or woody cover, if the invasives are woody).	0]
		invasive species comprise 20-50% of the herb cover (or woody cover, if the invasives are woody).	0	
F24	Investus Carres Al	invasive species comprise >50% of the herb cover (or woody cover, if the invasives are woody).	0	If a plant connet he identified to energy /
F21	Invasive Cover Along Upland Edge	Along the wetland-upland boundary, the percent of the upland edge (within 3 m upslope from the wetland) that is occupied by invasive plant species is:		If a plant cannot be identified to species (e.g., winter conditions) but its genus contains an exotic species, assume the unidentified plant to also be exotic. If vegetation is so senesced that exotic
	Upland Edge	·	0	species cannot be identified, answer "none". [PH, STR]
	Upland Edge	none of the upland edge (invasives apparently absent), or AA has no upland edge.		
	Upland Edge	some (but <5%) of the upland edge.	1	
	Upland Edge	some (but <5%) of the upland edge. 5-50% of the upland edge.	0

F37	Interspersion of	During most of the part of the growing season when water is present, the spatial pattern of emergent vegetation within the water is mostly:		[AM, FA, FR, INV, NR, OE, PH, PR, SBM, SR, WBF, WBN]
	Emergents & Open Water	Scattered. More than 30% of such vegetation forms small islands or corridors surrounded by water.	0	
	water	Intermediate.	0	
		Clumped. More than 70% of such vegetation is in bands along the wetland perimeter or is clumped at one or a few sides of the surface water area.	0	
F38	Persistent Deepwater	If the deepest patch of surface water (flowing or ponded) in or directly adjacent to the AA is mostly deeper than 0.5 m for >2 weeks during the growing season, enter "1" and continue. If not, enter "0" and SKIP to F42 (Connection).	0	
F39	Area Non-vegetated Aquatic	During most of the growing season and in waters deeper than 0.5 m, the cover for fish, aquatic invertebrates, and/or amphibians that is		For this question, consider only the wood that is at or above the water surface. Estimates of underwater
	Cover	provided NOT by living vegetation, but by accumulations of dead wood and undercut banks is:		wood based only on observations from terrestrial viewpoints are unreliable so should not be attempted. [AM, FA, FR, INV]
		Little or none. Intermediate.	0	[Pagi, 174, 115, 1154]
E10		Extensive.	0	Survey
F40	Isolated Island	The AA contains (or is part of) an island or beaver lodge within a lake, pond, or river, and is isolated from the shore by water depths > 1 m on all sides during an average June. The island may be solid, or it may be a floating vegetation mat that is sufficiently large and dense to support a waterbird nest.	0	[WBN]
F41	Duckweed	At some time of the year, mats of algae and/or duckweed are likely to cover >50% of the AA's otherwise-unshaded water surface, or blanket >50% of the underwater substrate. If true, enter "1" in next column. If untrue or uncertain, enter "0".	0	[EC, PR, WBF]
F42	Channel Connection & Outflow Duration	The most persistent surface water connection (outlet channel or pipe, ditch, or overbank water exchange) between the AA and a downslope stream network is: [Note: If the AA represents only part of a welland, answer this according to whichever is the least permanent surface connection: the one between the AA and the rest of the wetland, or the surface connection between the wetland and the downslope stream network.] Persistent (surface water flows out for >9 months/year).	1	Consider the connection regardless of whether the surface water is frozen. The "downslope stream network" could consist of ditches, rivers, ponds, or lakes which eventually connect to the ocean. If this cannot be determined while visiting the AA, consult topographic maps perhaps by viewing these online with Toporama (http://atlas.nrcan.gc.ca/toporama/en/index.html) [CS, FA, FR, NR, OE, PR, Sens, SFS SR, WCv, WS]
		Seasonal (surface water flows out for 14 days to 9 months/year, not necessarily consecutive).	0	
		Temporary (surface water flows out for <14 days, not necessarily consecutive). None but maps show a stream network downslope from the AA and within a distance that is less than the AA's length. SKIP to F47 (pH	0	
		Measurement).		
		No surface water flows out of the wetland except possibly during extreme events (<once (ph="" 10="" a="" an="" dlich,="" f47="" flows="" into="" lacks="" lake="" measurement).<="" only="" or="" or,="" outlet.="" per="" skip="" td="" that="" to="" water="" wetland,="" years).=""><td>0</td><td></td></once>	0	
F43	Outflow Confinement	During major runoff events, in the places where surface water exits the AA or connected waters nearby, the water:		"Major runoff events" would include biennial high water caused by storms and/or rapid snowmelt. [CS, NR, OE, PR, Sens, SR, STR, WS]
		Mostly passes through a pipe, culvert, narrowly breached dike, berm, beaver dam, or other partial obstruction (other than natural topography) that does not appear to drain the wetland artificially during most of the growing season.	0	
		Leaves through natural exits (channels or diffuse outflow), not mainly through artificial or temporary features. Is exported more quickly than usual due to ditches or pipes within the AA or connected to its outlet, or within 10 m of the AA's edge, which	0	
F.1.1	T. 1. O	drain the wetland artificially, or water is pumped out of the AA.		If in the state of the AA fellows
F44	Tributary Channel	At least once annually, surface water from a tributary channel that is >100 m long moves into the AA. Or, surface water from a larger permanent water body adjacent to the AA spills into the AA. If it enters only via a pipe, that pipe must be fed by a mapped stream or lake further upslope. If no, SKIP to F47 (pH Measurement).	0	If inlet tributaries cannot be searched for due to inaccessibility of part of the AA, follow suggestions in F42 above. [NRv, PH, PRv, SRv]
F45	Input Water Temperature	Based on lack of shade, water source characteristics, or actual temperature measurements, the inflow is likely to be warmer than surface water in the AA during part of most years. Enter 1= yes, 0= no.	0	[WCv]
F46	Throughflow	During its travel through the AA at the time of peak annual flow, water arriving in channels: [select only the ONE encountered by most of the incoming water].		[FA, FR, INV, NR, OE, PR, SR, WS]
	Resistance	Does not bump into many plant stems as it travels through the AA. Nearly all the water continues to travel in unvegetated (often incised)	0	
		channels that have minimal contact with wetland vegetation, or through a zone of open water such as an instream pond or lake.		
		Bumps into herbaceous vegetation but mostly remains in fairly straight channels. Bumps into herbaceous vegetation and mostly spreads throughout, or is in widely meandering, multi-branched, or braided channels.	0	
		Bumps into tree trunks and/or shrub stems but mostly remains in fairly straight channels. Bumps into tree trunks and/or shrub stems and follows a fairly indirect path from entrance to exit (meandering, multi-branched, or braided).	0	
F47	pH Measurement	The pH in most of the AA's surface water:		Preferably, measure this in larger areas of ponded surface water within the AA, or in streams that have passed through (not along) most of the AA. Unless surface water is completely absent, do not dig holes
		Was measured, and is: [enter the reading in the column to the right.] Was not measured but surface water is present and is darkly tea-coloured. Or if no surface water, then mosses and plants that indicate	0	or make depressions in peat in order to provide water for this measurement. Avoid measuring near
		peatland (e.g., Labrador tea) are prevalent. Enter "1".		roads or in puddles formed only by recent rain. [AM, FA, FR, NR, WBF, PH, PR, Sens, WBF, WBN]
F48	TDS and/or	Neither of above. Enter "1". The TDS (total dissolved solids) or conductivity off the AA's surface water is: (select the first true row with information):	1	See above for measurement guidance. [FR, INV, NRv, PH, PRv, Sens]
	Conductivity	TDS is: [Enter the reading in ppm or mg/L in the column to the right, if measured, or answer next row.]		-
		Conductivity is [Enter the reading in µS/cm in the column to the right.]		
		Was not measured, but plants that indicate saline conditions cover much of the vegetated AA. Enter *1". Neither of above	0	
F49	Beaver Probability	Use of the AA by beaver during the past 5 years is (select most applicable ONE):		[FA, FR, PH, SBM, Sens, WBF, WBN]
		Evident from direct observation or presence of gnawed limbs, dams, tracks, dens, lodges, or extensive stands of water-killed trees (snags).	0	
		Likely based on known occurrence in the region and proximity to suitable habitat, which may include: (a) a persistent freshwater wetland, pond, or lake, or a perennial low or mid-gradient (<10%) channel, and (b) a corridor or multiple stands of hardwood trees and shrubs in vegetated areas near surface water.	0	
	0 1	Unlikely because site characteristics above are deficient, and/or this is a settled area or other area where beaver are routinely removed.	1	
F50	Groundwater Strength of Evidence	Select first applicable choice: Springs are known to be present within the AA, or if groundwater levels have been monitored, that has demonstrated that groundwater primarily discharges to the wetland for longer periods during the year than periods when the wetland recharges the groundwater.	0	Adhere to these criteria strictly do not use personal judgment based on fen conditions, pH, or other evidence. Consult loggraphic maps to detect breaks in slope described here. Rust deposits associated with groundwater seeps may be most noticeable as orange discoloration in ice formations along streams during early winter. [AM, CS, FA, FR, INV, NR, CB, PH, PRV, SFS, WC, WS]
		Most of the AA has a slope of >5%, or is very close to the base of a natural slope longer than 100 and much steeper than the slope of the AA, AND the pH of surface water, if known, is >5.5.	0	prong accume suring early writes. [vwn, co.; r.v., r.v., IIV, IWK, UE, FTI, FTV, 5F5, WC, W5]
		Neither of above is true, although some groundwater may discharge to or flow through the AA. Or groundwater influx is unknown.	1	
F51	Internal Gradient	The gradient along most of the flow path within the AA is:	_	This is not the same as the shoreline slope. It is the elevational difference between the AA's inlet and outlet, divided by the flow-distance between them and converted to percent. If available, use a
		<2% or the AA has no surface water outlet (not even seasonally). 2-5%.	0	clinometer to measure this. Free clinometer apps can be downloaded to smartphones. If the wetland is large (longer than –1 km), this may be estimated using Google Earth to determine the minimum and
		6-10%.	0	maximum elevation within the AA, then dividing by length and multiplying by 100. [CS, NR, OE, PR,

Summary Ratings for Grouped Functions:						
HYDROLOGIC Group (WS)	4.79	Moderate	1.68	Lower	3.96	1.75
WATER QUALITY SUPPORT Group (max+avg/2 of SR, PR, NR, CS)	3.38	Moderate	2.89	Lower	6.62	3.30
AQUATIC SUPPORT Group (max+avg/2 of SFS, INV, OE, WC)	8.06	Higher	6.57	Higher	6.27	4.02
AQUATIC HABITAT Group (max+avg/2 of FA, FR, AM, WBF, WBN)	4.18	Moderate	3.17	Moderate	4.43	3.38
TRANSITION HABITAT Group (max+avg/2 of SBM, PH, POL)	9.51	Higher	4.70	Moderate	8.22	4.14
WETLAND CONDITION (EC)			6.39	Moderate		7.92
WETLAND RISK (average of Sensitivity & Stressors)			2.26	Lower		3.02
	NOTE: A scor	e of 0 does not	mean the func	tion or benefit i	s absent from t	he wetland. It

NOTE: A score of 0 does not mean the function or benefit is absent from the wetland. It means only that this wetland has a capacity that is equal or less than the lowest-scoring one, for that function or benefit, from among the 98 NB calibration wetlands that were assessed previously.

Cover Page: Basic Description of Assessment	WESP-AC version 2
Site Name:	Burchill Wind Energy Project - PLE-W-01
Investigator Name:	Matt Alexander
Date of Field Assessment:	19 September 2019
Nearest Town:	Lorneville (west Saint John), New Brunswick
Latitude (decimal degrees):	45.172159
Longitude (decimal degrees):	66.20506
Is a map based on a formal on-site wetland delineation available?	Yes
Approximate size of the Assessment Area (AA, in hectares):	0.61
AA as percent of entire wetland (approx.). Attach sketch map if AA is smaller than the entire contiguous wetland.	
What percent (approx.) of the wetland were you able to visit?	100
What percent (approx.) of the AA were you able to visit?	100
Were you able to ask the site owner/manager about any of the questions?	No
Indicate here if you intentionally surveyed for rare plants, calciphile plants, or rare animals	Yes
Have you attended a WESP-AC training session? If so, indicate approximate month & year	Yes, September 2016
How many wetlands have you assessed previously using WESP-AC? (approx.	15
Comments about the site or this WESP-AC assessment (attach extra page if desired):	

Form OF (Office). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Conduct an assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answering many of the questions below will equire using these online map viewers:

Google Earth Pro: https://www.google.com/earth/download/gep/agree.html

GeoNB: http://www.snb.ca/geonb1/ and http://www.snb.ca/geonb1/e/apps/apps-E.asp

Geons: http://www.snb.ca/geonol/ and http://www.snb.ca/geonol/e/apps/apps/apps-e.asp
For most wetlands, completing this office data form will require 1-2 hours. For a list of functions to which each question pertains, see bracketed abbreviations in the Definitions/Explanations column. For detailed descriptions of each
WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus
Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding
Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity, STR= Stressors.

#	Indicators	Condition Choices	Data	Definitions/Explanations
DF1	Province	Mark the province in which the AA is located by changing the 0 in the column next to it to a "1". Mark only one.		This determines to which province's calibration wetlands the raw score of any wetland is normalised In the function and benefits models, it also triggers the automatic exclusion of indicators for which no
		New Brunswick	1	spatial data exists in a particular province.
		Nova Scotia	0	
		Prince Edward Island	0	
		Newfoundland-Labrador	0	
DF2	Ponded Area Within 1 km.	The area of surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) within 1 km is:		"Adjacent" means not separated from the AA by a wide expanse (>50 m) of upland (including road >50 m wide). Include ponded areas likely to be hidden by wetland vegetation. If surface water
		<0.01 hectare (about 10 m x 10 m).	0	extends beyond 1 km, include only the part within 1 km. Do not include tidal areas. Measure the ar from aerial imagery using Google Earth Pro (click on Ruler icon in toolbar, then Polygon in pop-up
		0.01 - 0.1 hectare.	0	menu). With the GeoNB viewer, enable the Wetlands layer, then measure with the Draw & Measure
		0.1 - 1 hectare.	0	tool after specifying Aerial as the Basemap. However, do not rely entirely on wetland boundaries
		1 to 10 hectares.	1	shown in online wetlands layers. [PH, SBM, WBN]
		10 to 100 hectares. >100 hectares.	0	4
)F3	Ponded Water &	The area of wetlands and surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) within		See definition of adjacent in OF2. If the AA's wetland vegetation extends beyond 1 km, include only
,, ,	Wetland Within 1 km.	1 km is:		the part within 1 km. "Ponded" means not flowing in rivers or streams. [Sens, WBF]
		<0.01 hectare (about 10 m x 10 m).	0	4
		0.01 - 0.1 hectare. 0.1 - 1 hectare.	0	1
		1 to 10 hectares.	1	
		10 to 100 hectares.	0	
		>100 hectares.	0	1
F4	Size of Largest Nearby	The largest vegetated patch or corridor that includes the AA's vegetation plus aladjacent upland vegetation that is not lawn, row crops,	۱	See definition of adjacent in OF2. Use Google Earth Pro's polygon ruler (as described above).
	Vegetated Tract or	heavily grazed lands, conifer plantation is:		Exclude conifer plantations only if it is obvious that trees were planted in rows. [AM, PH, SBM, Sens
	Corridor	<0.01 hectare (about 10 m x 10 m).	0	1
		0.01 - 0.1 hectare.	0	1
		0.1 - 1 hectare.	0]
		1 to 10 hectares.	0	
		10 to 100 hectares.	0	
		100 to 1000 hectares.	0	
		>1000 hectares. [This is nearly always the answer in relatively undeveloped landscapes]	1	
DF5	Distance to Large Vegetated Tract	The minimum distance from the edge of the AA to the edge of the closest vegetated land (but excluding row crops, lawn, conifer plantation) larger than 375 hectares (about 2 km on a side), is:		To measure distance, use Google Earth Pro (Ruler > Line tool). Or use Draw & Measure tool at GeoNB. The 375-ha criterion is from the Fundy Model Forest Project. [AM, PH, POL, SBM, Sens]
		-50 m, and not separated from the 375-ha vegetated area by any width obpaved roads, stretches of open water, row crops, bare ground, lawn, or impervious surface. Or the AA itself contains >375 ha of vegetation. [This is often the answer in relatively undeveloped landscape.]	1	
		<50 m, but completely separated from the 375-ha vegetated area by those features, and AA does not contain >375 ha of vegetation.	0	
		50-500 m, and not separated.	0	
		50-500 m, but separated by those features.	0	
		0.5 - 5 km, and not separated.	0	
		0.5 - 5 km, but separated by those features.	0	
)F6	Herbaceous Uniqueness	None of the above (the closest patches or corridors which are that large are >5 km away). The AA's vegetation cover is >10% herbaceous* but uplands within 5 km have <10% herbaceous cover. If so, enter "3" and continue to	0	For this question only, consider moss to be herbaceous vegetation. Determine the score by viewing
5. 0	TO THE STATE OF TH	OF7. If not, consider: The AA's vegetation cover is >10% herbaceous* but uplands within 1 km have <10% herbaceous cover. If so enter "2" and continue to OF7. If not, consider: The AA's vegetation cover is >10% herbaceous* but uplands within 100 m of the wetland edge have <10% herbaceous cover. If so, enter 1". "NOTE: Exclude lawns, row crops, heavily grazed lands, forest, shrublands. Include moss as well as grasslike plants in this use of "herbaceous vegetation"]		aerial imagery in Google Earth after successively drawing or estimating the boundaries of the buffer of 5 km, 1 km, and 100 m radius focused on the center of the AA. Circles of specified radius can be drawn in Google Earth Pro by clicking on the Ruler icon, then Circle in the pop-up menu. [AMv, PH POLv, SBMv, WBFv, WBNv]
)F7	Woody Uniqueness	The AA's vegetation cover is >10% woody* but uplands within 5 km have <10% woody cover. If so, enter "3" and continue to OF8. If not, consider: The AA's vegetation is >10% woody* but uplands within 1 km have <10% woody cover. If so enter "2" and continue to OF8. If not, consider: The AA's vegetation is >10% woody* but uplands within 100 m of the wetland edge have <10% woody cover. If so, enter "1" [*NOTE: woody cover = trees & shrubs taller than 1 m.]	0	See above. Do not consider conlifer plantalions to be forest if it is obvious that trees were planted in rows. [AMW, PHV, POLv, SBMV]
F8	Local Vegetated Cover Percentage	Draw a 5-km radius circle measured from the center of the AA. Ignoring all permanent water in the circle, the percent of the remaining are that is wooded or unmanaged herbaceous vegetation (NOT lawn, row crops, bare or heavily grazed land, clearcuts, or confer plantations, is:		In Google Earth, draw the 5 km buffer and then estimate land cover percentages, or do GIS analysi of an appropriate land cover layer. [AM, PH, POL, SBM, Sens]
		<5% of the land.	0	1
		5 to 20% of the land.	0	1
		20 to 60% of the land.	0	
		60 to 90% of the land.	0	
		>90% of the land. SKIP to OF10.	1	
	Type of Land Cover	Within the 5-km radius circle, and ignoring all permanent water, the land area that is bare or non-perennial cover is mostly:		[AM, SBM]
OF9	Alteration	Impervious surface, e.g., paved road, parking lot, building, exposed rock.	0	1
JF Y		Bare pervious surface, e.g., lawn, recent (<5 yrs ago) clearcut, dirt or gravel road, cropland, landslide, conifer plantation.	0	
IFY				"Population center" means a settled area with more than about 5 regularly- inhabited structures per
	Distance by Road to	Measured along the maintained road nearest the AA, the distance to the nearestpopulation center is:		
	Nearest Population		n	square kilometer. In Google Earth, click on the Ruler icon, then Path, and draw and measure the
		<100 m.	0	square kilometer. In Google Earth, click on the Ruler icon, then Path, and draw and measure the route. Or use the GeoNB's Draw & Measure tool> Freehand Line to draw and measure the route to
	Nearest Population	<100 m. 100 - 500 m.	0	square kilometer. In Google Earth, click on the Ruler icon, then Path, and draw and measure the route. Or use the GeoNB's Draw & Measure tool> Freehand Line to draw and measure the route to Settlements (click on Place Names in menu) or other areas not close to mapped settlements but
	Nearest Population	<100 m.		square kilometer. In Google Earth, click on the Ruler icon, then Path, and draw and measure the route. Or use the GeoNB's Draw & Measure tool> Freehand Line to draw and measure the route to

OF11	Distance to Nearest Maintained Road	From the center of the AA, the distance to the nearest maintained public road (dirt or paved) is:		Determine this by viewing aerial imagery in Google Earth and measuring with the Ruler>Line tool. use the GeoNB's Draw Line tool. [AM, FAV, FRV, NRV, PH, PU, SBM, STR, WBN]
	ividii italii eu Rodu	<10 m.	0	use the geolog's Draw Line (uoi. [Alw, FAV, FRV, NRV, PH, PU, SDM, STR, WDN]

		0.5 - 1 km, but separated by those features.	- 1	
		None of the above (the closest patches or corridors that large are >1 km away).	0	
OF14	Distance to Large Ponded Water	The distance from the AA center to the closest (but separate)non-tidal body of water that is ponded during most of the year and islarger than 8 hectares during most of a normal year is: 4100 m.	0	Determine this by viewing aerial imagery in Google Earth. [Sens, WBF, WBN]
		100 m · 1 km.	0	1
		1-2 km.	0	†
		2-5 km.	- 1	
		5-10 km.	0	
05/-		>10 km.	0	
OF15	Tidal Proximity	The distance from the AA edge to the closest tidal water body (regardless of its salinity) is:		In Google Earth, measure the distance to the ocean (including Bay of Fundy) or tidal river, whicher is closer. If you need to see how far upriver a river is tidal, see the KMZ file provided with this
		<100 m.	0	calculator for NB (NB Headtide). Points shown in those files are only an approximation, so local
		100 m - 1 km.	1	information if available may be preferable. [FA, WBF]
		1 - 5 km. 5-10 km.	0	-
		10-40 km	0	1
		>40 km.	0	1
OF16	Upland Edge Contact	Select one:		[NR, SBM, Sens]
		The AA has no upland edge (or upland is <1% of perimeter). The AA is entirely surrounded by (& contiguous with) other wetlands or water	. 0	
		1-25% of the AA's perimeter abuts upland (including filled areas). The rest adjoins other wetlands or water that is mostly wider than the AA		
		25-50% of the AA's perimeter abuts upland. The rest adjoins other wetlands or water that is mostly wider than the AA.	0	_
		50-75% of the AA's perimeter abuts upland. The rest adjoins other wellands or water that is mostly wider than the AA. More than 75% of the AA's perimeter abuts upland. Any remainder adjoins other wellands or water that is mostly wider than the AA.This	0	
		will be true for most assessments done with WESP-AC.		
OF17		Within 5 km downstream or downslope of the AA (select first true choice):		In the GeoNB map viewer: click on "More" in upper right, then "Flood Information". Expand the me
	tidal Waters	Maps show Flood Zone or Flood Risk areas and there appears to be infrastructure vulnerable to river flooding not caused by tidal storm surges.	0	under it by clicking on the arrow to its left and the slider to its right. Uncheck the first (Limits of Dat box. Where available, LiDAR imagery can provide finer elevational resolution useful for flood modeling, (MSv)
		Maps show Flood Zone or Flood Risk areas, but infrastructure is absent or is not vulnerable to floods from a non-lidal river. In some cases tevees, upriver dams, or other measures may partly limit damage or risk from smaller events. Maps do not show Flood Zone or Flood Risk areas pr no such mapping has been done locality, and there appears to be infrastructure	0	
		vulnerable to river flooding unrelated to tidal storm surges. Maps do not show Flood Zone or Flood Risk areas (or no such mapping has been done locally) and there i no infrastructur e vulnerable	1	
OF18	Relative Elevation in Watershed	to river flooding unrelated to tidal storm surges. In Google Earth, enable the Terrain layer (lower left menu) and open the NB_Watersheds KMZ file that accompanies this calculator. Then determine the AA's approximate elevation (bottom right, NOT the "eye alt"). Then move cursor around to determine the watershed's maximum and minimum elevation. Divide the AA's elevation by the (max-mini).	0.18	[FA, NR, Sens, SFSv, WCv, WSv]
OF19	Water Quality Sensitive Watershed or Area	In Google Earth, open the KMZ file NB_Watershed Protected Area which accompanies this calculator. The AA is within such an area. Enter 1= yes, 0= no.	0	If an ACCDC report is available for this AA, it also may contain such information. [NRv]
OF20	Degraded Water Upstream	Sampling indicates a problem with concentrations ofmetals, hydrocarbons, nutrients, or other substances (excluding bacteria, acidic water, high temperatures) being present at levels harmful to aquatic life or humans, and:		May use existing data, or sample those waters as part of this wetland assessment. "Harmful" shou be evaluated with regard to current federal or provincial water quality standards. [AM, FA, FR, NRv
		The condition is present within the AA.	0	PRv, SRv, STR, WBF, WBN]
		The condition is present in waters within 1 km that flowinto the AA, but has not been documented in the AA itself.	0	
		Sampling during both low water periods and times with high runoff (storms, snowmelt) indicates no problems in either the AA or inflowing waters.	0	
		Data are insufficient (no or inadequate sampling within 1 km, or condition exists only at >1 km upstream)This is the situation for nearly all wetlands in this region.	1	
OF21	Degraded Water	The problem described above is downslope from the AA, and:		May use existing data, or monitor waters as part of this wetland assessment. [NRv, PRv, SRv]
	Downstream	The condition is present within 1 km downslope and connected to the AA by a channel.	0	1
		The condition is present within 5 km downslope and connected to the AA by a channel, or within 1 km but not connected to the AA by a	0	†
		channel. Sampling during both low water periods and times with high runoff (storms, snowmelt) indicates no problems in either the AA or inflowing	0	
		waters. Data are insufficient (no or inadequate sampling within 1 km, or condition exists only at >1 km upstream)This is the situation for nearly all wetlands in this region.	1	
OF22	Wetland as a % of Its Contributing Area (Catchment)	From a topographic map and field observations, estimate the approximate boundaries of the catchment (CA) of the entire wetland of which the AA may be only a part. Then adjust those boundaries if necessary based on your field observations of the surrounding terrain, and/or using procedures described in the Manual. Divide the area of the wetland (not just the AA) by the approximate area of its catchment excluding the area of the wetland itself. When doing the calculation, if ponded water is adjacent to the wetland, include that in the wetland area. The result is:	V	Topographic maps may be viewed online at the National Atlas of Canada (Toporama): http://atlas.gc.ca/toporama/en/index.html [NR, PR, Sens, SR, WS]
		0.1 to 1.	0	1
		>1 (wetland is larger than its catchment (e.g., wetland with flat surrounding terrain and no inlet, or is entirely isolated by dikes, or is a raise	0	1
OF23	Unvegetated Surface in	bog). The proportion of the AA's contributing area (measured to no more than 1000 m upslope) that is comprised of buildings, roads, parking lob		[FA, INV, NRv, PRv, SRv, STR, WCv, WSv]

Form F (Field). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Walk for no less than 10 minutes from the wetland edge towards its core, in the part of the AA that is proposed for alteration. If no alteration is proposed, walk in a portion that appears to be most representative of the wetland overall. Walk only where it is safe and legal to do so. Conduct the assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answer these questions primarily based on your onsite observations and interpretations. Do not write in shaded parts of this data form. Answering some questions accurately may require conferring with the landowner or other knowledgable persons and/or reviewing aerial imagery. For most wetlands, completing this field data form will require 1-2 hours on a site. For a list of functions to which each question pertains, see the accompanying Interpretations form. For detailed descriptions of each WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage & Delay, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity, STR= Stressors.

#	Indicators	Condition Choices	Data	Definitions/Explanations
1	Wetland Type	Follow the key below and mark the ONE row that best describes MOST of the vegetated part of the AA:		Ericaceous shrubs are ones in the heather family (Ericaceae). Most have leathery evergreen leaves. They include rhododendron, azalea, swamp laurel, leatherleaf, Labrador tea, and others. Most require
		A Moss and/or lichen cover more than 25% of the ground. Often dominated by ericaceous shrubs (e.g., Labrador lea) or other acid-tolerant plants (e.g., bog cranberry, pitcher plant, sundew, orchids). Substate is mostly undecomposed peat. Choose between A1 and A2 and mark the choice with a 1 in their adjoining column. Otherwise go to 8 below.		acidic soil. Although not in the family Ericaceae, sweetgale (Myrica gale) should be counted also. [AM, CS, FA, FR, INV, NR, OE, PH, Sens, SFS, WBF, WBN]
		A1. Surface water is usually absent or, if present, pH is typically <4.5 and conductivity is usually <100 µS/cm (<64 ppm TDS). Trees are absent or nearly so. Sedge cover usually sparse or absent but cottongrass and/or lichen cover may be extensive, as well as cloudberry, lingonberry, sheep laurel, and a sedge (Carex rarillora). Welland surface and surrounding landscape are seldom sloping and welland often is domed (convex). Inlet and outlet channels are usually absent. If known, pH of peat is <4.0.	0	
		A2. Not A1. Surface water, if present, has pH typically >4.5 and conductivity is usually >100 µS/cm (>64 ppm TDS). Sedge cover is usually extensive, and/or tree and fall shrub cover is extensive. Sometimes at toe of slope or edge of water body. An exit channel is usually present. Wetter than A1 and peat depth may be shallower (<2 m).	0	
		B. Moss and/or lichen cover less than 25% of the ground. Soil is mineral or decomposed organic (muck). Choose between B1 and B2 and mark the choice with a 1 in their adjoining column:		
		B1. Trees and shrubs taller than 1 m comprise more than 25% of the vegetated cover. Surface water is mostly absent or inundates the vegetation only seasonally (e.g., vernal pools or floodplain).	1	
		B2. Not B1. Tree & tall shrubs comprise less than than 25% of the vegetated cover. Vegetation is mostly herbaceous, e.g., cattail, bulrush, burreed, pond lily, horsetail. Surface water may be extensive and fluctuates seasonally, being either persistent or drying up partly or entirely.	0	
AA sh includ " adja descri	ould also include part of a e the open water part ad, cent " is used synonymo, bed features along their a	the AA should include all persistent waters in ponds smaller than 8 hectares (-283 m on a side) that are adjacent to the AA. The the water area of adjacent ponded water larger than 8 ha and adjacent rivers wider than 20 m. Specifically, the AA should fjacent to welland vegetation and equal in width to the average width of that vegetated zone. Throughout this aform, usly with abutting, adjoining, bordering, contiguous and means no upland (manmade or natural) completely separates the directly shared edge. Features joined only by a channel are not necessarily considered to be adjacent a large portion of their res do not have to be hydrologically connected in order to be considered adjacent.		
2	Wetland Types - Adjoining or Subordinate	If the AA is smaller than 1 ha, mark all other types that occupy more than 1% of the vegetated AA. If the AA is larger than 1 ha, mark all other types which are within or adjacent to the AA and occupy more than 1 ha, as visible from the AA or as interpreted from aerial imagery. Do not mark again the type marked in F1.		1 hectare is 10,000 sq. m or about 2.5 acres. It could have dimensions of 100 m by 100 m, 1000 m by 10 m, or similar. [AM, INV, SBM, WBF]
		A1. A2.	0	
		B1.	0	
3	Woody Height & Form	B2. Following EACH row below, indicate with a number code the percentage of the living vegetation in the AA which is occupied by that feature (6	1	Deciduous shrubs in this region usually include buttonbush, Labrador tea, bayberry (Morella),
	Diversity	# >95%, 5 if 75-95%, 4 if 50-75%, 3 if 25-50%, 2 if 5-25%, 1 if <5%, 0 if none). If the vegetated part of the AA is largely herbaceous (non-woody) vegetation, these percentages should not sum to 100%.		huckleberry, cranberry, cloudberry, sweetgale, alder, willow, birch, ash, dogwood, and a few others. If you assigned a code of 3 or higher to any of the first four choices and the ground cover beneath the trees/shrubs is <25% moss, then question F1 might be *B1*. [CS, INV, NR, PH, POL, SBM, Sens]
		coniferous trees (may include tamarack) taller than 3 m. deciduous trees taller than 3 m.	5 1	
		coniferous or ericaceous shrubs or trees 1-3 m tall not directly below the canopy of trees. deciduous shrubs or trees 1-3 m tall not directly below the canopy of trees.	3 1	
		coniferous or ericaceous shrubs <1 m tall not directly below the canopy of taller vegetation.	2	
Note :	If none of top 4 rows in	deciduous shrubs or trees <1 m tall (e.g., deciduous seedlings) not directly below the canopy of taller vegetation. F3 was marked 2 or greater, SKIP to F9 (N fixers).	1	
4	Dominance of Most	Determine which two woody plant species comprise the greatest portion of the low (<3 m) woody cover . Then choose one:		[PH, POL, SBM, Sens]
	Abundant Shrub Species	those species together comprise > 50% of such cover.	1	
5	Woody Diameter Classes	those species together do not comprise > 50% of such cover. Mark ALL the types that comprise > 5% of the woody canopy cover in the AA or > 5% of the wooded areas (if any) along its upland edge (perimeter). The edge should include only the trees whose canopies extend into the AA.	0	Estimate the diameters at chest height. If small-diameter trees are overtopped (shaded) by larger ones, visualise a "subcanopy" at the average height of the smaller-dbh trees, to serve as a basis for t
		coniferous, 1-9 cm diameter and >1 m tall. broad-leaved deciduous 1-9 cm diameter and >1 m tall.	1	minimum 5% canopy requirement in this question. The trees and shrubs need not be wetland species [AM, CS, POL, SBM, Sens, WBN]
		conferous, 10-19 cm diameter.	1

		>75% of the vegetated cover, in the AA or along its water edge (whichever has more).	0	
F10	Sphagnum Moss	The cover of Sphagnum moss (or any moss that forms a dense cushion many centimeters thick), including the moss obscured by taller		Exclude moss growing on trees and rocks. [CS, PH]
	Extent	sedges and other plants rooted in it, is:		
		<5% of the vegetated part of the AA.	0	
		5-25% of the vegetated part of the AA. 25-50% of the vegetated part of the AA.	0	
		50-95% of the vegetated part of the AA.	0	
		>95% of the vegetated part of the AA.	0	
F11	% Bare Ground &	Consider the parts of the AA that lack surface water at the driest time of the growing season. Viewed from directly above the ground layer, the		Thatch is dead plant material (stems, leaves) resting on the ground surface. Bare ground that is
	Thatch	predominant condition in those areas at that time is:		present under a tree or shrub canopy should be counted. Boulders count as bare ground. Wetlands with mineral soils and that are heavily shaded or are dominated by annual plant species tend to have
		Little or no (<5%) bare ground is visible between erect stems or under canopy anywhere in the vegetated AA Ground is extensively blanketed by dense thatch, moss, lichens, graminoids with great stem densities, or plants with ground-hugging foliage.	0	more extensive areas that are bare during the early growing season. [AM, EC, INV, NR, OE, POL, PR, SBM, Sens]
		Slightly bare ground (5-20% bare between plants) is visible in places, but those areas comprise less than 5% of the unflooded parts of the	1	
		Much bare ground (20-50% bare between plants) is visible in places, and those areas comprise more than 5% of the unflooded parts of the AA	0	
		Other conditions.	0	
		Not applicable. Surface water (either open or obscured by emergent plants) covers all of the AA all the time.	0	
F12	Ground Irregularity	Imagine the AA without any living vegetation. Excluding the portion of the AA that is always under water, the number of hummocks, small pits,		The depressions may be of human or natural origin. [AM, EC, INV, NR, PH, POL, PR, SBM, SR, WS]
		raised mounds, animal burrows, ruts, guilles, natural levees, microdepressions, and other areas of peat or mineral soil that are raised or depressed >10 cm compared to most of the area within a few meters surrounding them is:		
		Few or none (minimal microtopography; <1% of the land has such features, or entire AA is always water-covered).	0	
		Intermediate. Several (extensive micro-topography).	0	
F13	Upland Inclusions	Several (extensive micro-topograpny). Within the AA, inclusions of upland are:		[AM, NR, SBM]
	,	Few or none.	0	•
		Intermediate (1 - 10% of vegetated part of the AA).	1	
		Many (e.g., wetland-upland "mosaic", >10% of the vegetated AA).	0	
F14	Soil Texture	In parts of the AA that lack persistent water, the texture of soil in the uppermost layer is mostly: [To determine this, use a trowel to check in at		[CS, NR, OE, PH, PR, Sens, SFS, WS]
		least 3 widely spaced locations, and use the soil texture key (in Appendix A of the Manual).]		
		Loamy: soils that may contain a little fine grit and do not make a "ribbon" longer than 2 cm when moistened, rolled, squeezed, and extended between thumb and forefinger.	0	
		Fines: includes silt, clay, silt, soils that make a ribbon longer than 2 cm when moistened, rolled, squeezed, and extended between thumb and	1	
		forefinger.		
		Deep Peat, to 40 cm depth or greater.	0	
		Shallow Peat or organic <40 cm deep. Coarrest includes send teamy and gravet solbtle soils that do not make a ribbon when maintened relied sources of and extended	0	
		Coarse: includes sand, loamy sand, gravel, cobble, soils that do not make a ribbon when moistened, rolled, squeezed, and extended between thumb and forefinger.	U	
F15	Shorebird Feeding	During any 2 consecutive weeks of the growing season, the extent of mudflats, bare unshaded saturated areas not covered by thatch, and		This addresses needs of many but not all migratory sandpipers, plovers, and related species. [WBF]
	Habitats	unshaded waters shallower than 6 cm is: [Include also any area that is adjacent to the AA.]		
		None, or <100 sq. m. 100-1000 sq. m.	0	
		1000 – 10,000 sq. m.	0	
		>10,000 sq. m.	0	
F16	Herbaceous % of	In aerial ("ducks eye") view, the maximum annual cover of herbaceous vegetation (all non-woody plants except moss) is:		[AM, WBF, WBN]
	Vegetated Wetland	<5% of the vegetated part of the AA or <0.01 hectare (whichever is less). Mark "1" here and SKIP to F20 (Invasive Plant Cover).	0	
		5-25% of the vegetated part of the AA.	1	
		25-50% of the vegetaled part of the AA. 50-95% of the vegetaled part of the AA.	0	
		>95% of the vegetated part of the AA.	0	
F17	Forb Cover	Within parts of the AA having herbaceous cover (excluding SAV), the areal cover of forbs reaches an annual maximum of:		Forbs are flowering plants. Do not include grasses, sedges, cattail, other graminoids, ferns, horsetails,
		<5% of the herbaceous part of the AA.	1	or others that lack showy flowers. [POL]
		5-25% of the herbaceous part of the AA.	0	
		25-50% of the herbaceous part of the AA.	0	
		50-95% of the herbaceous part of the AA.	0	
F18	Sedge Cover	>95% of the herbaceous part of the AA. Sedges (Carex spp.) and cottongrass (Eriophorum spp.) occupy:	0	[CS]
1 10	Sauge Cover			[oo]
		<5% of the vegetated area, or none. 5-50% of the vegetated area.	0	
		5-50% of the vegetated area. 50-95% of the vegetated area.	0	
		>95% of the vegetated area.	0	
F19	Dominance of Most	Determine which two herbaceous species comprise the greatest portion of the herbaceous cover (excluding mosses and floating-leaved		For this question, include ferns as well as graminoids and forbs. [EC, INV, PH, POL, Sens]
		aquatic plants). Then choose one of the following:		
	Species	those species together comprise > 50% of the areal cover of herbaceous plants at any time during the year. those species together do not comprise > 50% of the areal cover of herbaceous plants at any time during the year.	0

		vegetated zone within the wetland. Enter "1" if true, "0" if false.		
	Lacustrine Wetland	The vegetated part of the AA is within or adjacent to a body of non-tidal standing open water whose size exceeds 8 hectares during most of	0	[FR, PR, PU, WBF, WBN]
F23		a normal year.		

FieldF form - Non-tidal Page 2 of 5

F24	% of AA Without Surface Water	The percentage of the AA that never contains <u>surface</u> water during an average year (that is, except perhaps for a few hours after snowmell or trainstorms), but which is still a wetland, is:		1 hectare is 10,000 sq. m or about 2.5 acres. It could have dimensions of 100 m by 100 m, 1000 m by 10 m, or similar. [AM, FA, FR, INV, NR, PH, PR, SBM, Sens, SRv, WBF, WBN, WC]
		<1%. In other words, all or nearly all of the AA is covered by water permanently or at least seasonally.	0	
		1-25% of the AA, or <1% but >0.01 ha never contains surface water. 25-50% of the AA never contains surface water.	0	
		50-75% of the AA never contains surface water.	0	
		75-99% of the AA never contains surface water, or >99% AND there is at least one persistent water body larger than 1 ha in the AA.	1	
		99-100%. AND there is no persistent ponded water body larger than 1 ha within the AA. Enter *1* and SKIP to F42 (Channel Connection).	0	
F25	% of AA with Persistent Surface Water	Identify the parts of the AA that still contain surface water (flowing or ponded, open or hidden beneath vegetation) even during the driest limes of a normal year, i.e., when the AA's surface water is at its lowest annual level. At that time, the percentage of the AA that still contains surface water is:		If you are unable to determine the condition at the driest time of year, ask the land owner or neighbors about it if possible. Indicators of persistence may include fish, some dragonflies, beaver, and muskrat. [AM, CS, FA, FR, INV, NR, POL, PR, SBM, WBF, WBN]
		None. The AA dries up completely (no water in channels either) or never has surface water during most years. SKIP to F27.	0	
		1-20% of the AA. 20-50% of the AA.	0	
		50-95% of the AA.	0	
F0/		>95% of the AA. True for many fringe wetlands.	0	IEA MOI
F26	% of Summertime Water that Is Shaded	At mid-day during the warmest time of year, the area of surface water <u>within</u> the AA that is shaded by vegetation and other features that are <u>within</u> the AA at that time is:		[FA, WC]
		<5% of the water is shaded, or no surface water is present then.	1	
		5-25% of the water is shaded. 25-50% of the water is shaded.	0	
		50-75% of the water is shaded.	0	
F07	00.000	>75% of the water is shaded.	0	
F27	% of AA that is Flooded Only	The percentage of the AA's area that is between the annual high water and the annual low water (surface water) is:		Flood marks (algal mats, adventitious roots, debris lines, ice scour, etc.) are often evident when not fully inundated. Also, such areas often have a larger proportion of upland and annual (vs. perennial)
	Seasonally	None, or <0.01 hectare and <1% of the AA. SKIP to F29. 1-20% of the AA. or <1% but >0.01 ha.	0	plant species. In riverine systems, the extent of this zone can be estimated by multiplying by 2 the
		20-50% of the AA.	0	bankful height and visualising where that would intercept the land along the river. [CS, FA, INV, NR, OE, PH, SR, WBF, WBN, WS]
		50-95% of the AA. >95% of the AA.	0	
F28	Annual Water	>95% of the AA. The annual fluctuation in surface water level within most of the parts of the AA that contain surface water at least temporarily is:	1	Look for flood marks (see above). Because the annual range of water levels is difficult to estimate
	Fluctuation Range	<10 cm change (stable or nearly so).	0	without multiple visits, consider asking the land owner or neighbors about it. [AM, CS, INV, NR, OE, PH,
		10 cm - 50 cm change.	1	PR, SR, WBN, WS]
		0.5 - 1 m change. 1-2 m change.	0	
		>2 m change.	0	
(Conne	ection).	water smaller than 0.01 hectare (about 10m x 10m, or 1m x 100 m)? If so, enter *1* in column D and SKIP TO F42	0	
F29	Predominant Depth Class	During most of the time when surface water is present during the growing season, its depth, averaged over the entire inundated part of the AA, is:		If a boat is unavailable, estimate this by considering wetland size and local topography. Or if timing and safety allow, depths may be measured by drilling through winter ice. This question is asking about the
		<10 cm deep (but >0).	1	spatial median depth that occurs during most of that time, even if inundation is only seasonal or
		10 - 50 cm deep.	0	temporary. If inundation in most but not all of the wetland is brief, the answer will be based on the depth of the most persistently inundated part of the wetland. Include surface water in channels and ditches as
		0.5 - 1 m deep. 1 - 2 m deep.	0	well as ponded areas. [CS, FA, FR, INV, OE, PH, PR, Sens, SFS, SR, WBF, WBN, WC]
		>2 m deep. True for many fringe wetlands.	0	
F30	Depth Classes - Evenness of	When present, surface water in most of the AA usually consists of (select one):		Estimate these proportions by considering the gradient and microtopography of the site. [FR, INV, WBF, WBN]
	Proportions	One depth class that comprises >90% of the AA's inundated area (use the classes in the question above). One depth class that comprises 50-90% of the AA's inundated area.	0	, , , , , ,
		Neither of above. There are 3 or more depth classes and none occupy >50%.	1	
F31	% of Water That Is Ponded (not Flowing)	During most times when surface water is present, the percentage that is (1) ponded (stagnant, or flows so slowly that fine sediment is not held in suspension) AND (2) is likely to be deeper than 0.5 m in some places, is:		Nearly all wetlands with surface water have some ponded water. [AM, CS, INV, NR, OE, PR, Sens, SR, WBF, WBN, WC, WS]
		<5% of the water, or it occupies <100 sq.m cumulatively. Nearly all the surface water is flowing. SKIP to F34.

FieldF form - Non-tidal Page 3 of 5

F37	Interspersion of	During most of the part of the growing season when water is present, the spatial pattern of emergent vegetation within the water is mostly:		[AM, FA, FR, INV, NR, OE, PH, PR, SBM, SR, WBF, WBN]
	Emergents & Open Water	Scattered. More than 30% of such vegetation forms small islands or corridors surrounded by water.	0	
	water	Intermediate.	0	
		Clumped. More than 70% of such vegetation is in bands along the wetland perimeter or is clumped at one or a few sides of the surface water area.	0	
F38	Persistent Deepwater	If the deepest patch of surface water (flowing or ponded) in or directly adjacent to the AA is mostly deeper than 0.5 m for >2 weeks during the growing season, enter "1" and continue. If not, enter "0" and SKIP to F42 (Connection).	0	
F39	Area Non-vegetated Aquatic	During most of the growing season and in waters deeper than 0.5 m, the cover for fish, aquatic invertebrates, and/or amphibians that is		For this question, consider only the wood that is at or above the water surface. Estimates of underwater
	Cover	provided NOT by living vegetation, but by accumulations of dead wood and undercut banks is:	0	wood based only on observations from terrestrial viewpoints are unreliable so should not be attempted. [AM, FA, FR, INV]
		Little or none. Intermediate.	0	[
F40	Isolated Island	Extensive. The AA contains (or is part of) an island or beaver lodge within a lake, pond, or river, and is isolated from the shore by water depths > 1 m on	0	[WBN]
		all sides during an average June. The island may be solid, or it may be a floating vegetation mat that is sufficiently large and dense to support a waterbird nest.	Ü	
	Duckweed	At some time of the year, mats of algae and/or duckweed are likely to cover >50% of the AA's otherwise-unshaded water surface, or blanket >50% of the underwater substrate. If true, enter "1" in next column. If untrue or uncertain, enter "0".	0	[EC, PR, WBF]
F42	Channel Connection & Outflow Duration	The most persistent surface water connection (outlet channel or pipe, ditch, or overbank water exchange) between the AA and a downslope stream network is: [Note: If the AA represents only part of a welland, answer this according to whichever is the least permanent surface connection: the one between the AA and the rest of the wetland, or the surface connection between the wetland and the downslope stream network.] Persistent (surface water flows out for >9 months/year).	0	Consider the connection regardless of whether the surface water is frozen. The "downslope stream network" could consist of ditches, rivers, ponds, or lakes which eventually connect to the ocean. If this cannot be determined while visiting the AA, consult topographic maps perhaps by viewing these online with Toporama (http://atlas.nrcan.gc.ca/toporama/en/index.html) [CS, FA, FR, NR, OE, PR, Sens, SFS SR, WCv, WS]
		Seasonal (surface water flows out for 14 days to 9 months/year, not necessarily consecutive).	0	
		Temporary (surface water flows out for <14 days, not necessarily consecutive). None but maps show a stream network downslope from the AA and within a distance that is less than the AA's length. SKIP to F47 (pH	0	
		Measurement). No surface water flows out of the wetland except possibly during extreme events (-once per 10 years). Or, water flows only into a wetland,	1	
E42	Outflow Confin	ditch, or lake that lacks an outlet. SKIP to F47 (pH Measurement).	1	*Major prooff overte* would include his-statistic materials at the second of the second overtex and the second overtex at the second over the
F43	Outflow Confinement	During major runoff events, in the places where surface water exits the AA or connected waters nearby, the water: Mostly passes through a pipe, culvert, narrowly breached dike, berm, beaver dam, or other partial obstruction (other than natural topography)	0	"Major runoff events" would include biennial high water caused by storms and/or rapid snowmelt. [CS, NR, OE, PR, Sens, SR, STR, WS]
		that does not appear to drain the wetland artificially during most of the growing season.		
		Leaves through natural exits (channels or diffuse outflow), not mainly through artificial or temporary features. Is exported more quickly than usual due to ditches or pipes within the AA or connected to its outlet, or within 10 m of the AA's edge, which drain the wetland artificially, or water is pumped out of the AA.	0	
F44	Tributary Channel	At least once annually, surface water from a tributary channel that is >100 m long moves into the AA. Or, surface water from a larger permanent water body adjacent to the AA spills into the AA. If it enters only via a pipe, that pipe must be fed by a mapped stream or take further upslope. If no, SKIP to F47 (pH Measurement).	0	If inlet tributaries cannot be searched for due to inaccessibility of part of the AA, follow suggestions in F42 above. [NRv, PH, PRv, SRv]
F45	Input Water Temperature	Based on lack of shade, water source characteristics, or actual temperature measurements, the inflow is likely to be warmer than surface water in the AA during part of most years. Enter 1= yes, 0= no.	0	[wcv]
F46	Throughflow	During its travel through the AA at the time of peak annual flow, water arriving in channels: [select only the ONE encountered by most of the		[FA, FR, INV, NR, OE, PR, SR, WS]
	Resistance	incoming water]. Does not bump into many plant stems as it travels through the AA. Nearly all the water continues to travel in unvegetated (often incised)	0	
		channels that have minimal contact with wetland vegetation, or through a zone of open water such as an instream pond or lake.		
		Bumps into herbaceous vegetation but mostly remains in fairly straight channels.	0	
		Bumps into herbaceous vegetation and mostly spreads throughout, or is in widely meandering, multi-branched, or braided channels.	0	
		Bumps into tree trunks and/or shrub stems but mostly remains in fairty straight channels. Bumps into tree trunks and/or shrub stems and follows a fairly indirect path from entrance to exit (meandering, multi-branched, or braided).	0	
F47	pH Measurement	The pH in most of the AA's surface water:		Preferably, measure this in larger areas of ponded surface water within the AA, or in streams that have passed through (not along) most of the AA. Unless surface water is completely absent, do not dig holes
		Was measured, and is: [enter the reading in the column to the right.] Was not measured but surface water is present and is darkly tea-coloured. Or if no surface water, then mosses and plants that indicate	0	or make depressions in peat in order to provide water for this measurement. Avoid measuring near
		peatland (e.g., Labrador tea) are prevalent. Enter "1".		roads or in puddles formed only by recent rain. [AM, FA, FR, NR, WBF, PH, PR, Sens, WBF, WBN]
F48	TDS and/or	Neither of above. Enter "1". The TDS (total dissolved solids) or conductivity off the AA's surface water is: (select the first true row with information):	1	See above for measurement guidance. [FR, INV, NRv, PH, PRv, Sens]
	Conductivity	TDS is: [Enter the reading in ppm or mg/L in the column to the right, if measured, or answer next row.]		
		Conductivity is [Enter the reading in µS/cm in the column to the right.] Was not measured, but plants that indicate saline conditions cover much of the vegetated AA. Enter "1".	0	
		Neither of above	1	
F49	Beaver Probability	Use of the AA by beaver during the past 5 years is (select most applicable ONE):		[FA, FR, PH, SBM, Sens, WBF, WBN]
		Evident from direct observation or presence of gnawed limbs, dams, tracks, dens, lodges, or extensive stands of water-killed trees (snags).	0	
		Likely based on known occurrence in the region and proximity to suitable habitat, which may include: (a) a persistent freshwater wetland, pond, or lake, or a perennial low or mid-gradient (<10%) channel, and (b) a corridor or multiple stands of hardwood trees and shrubs in vegetated areas near surface water.	0	
TEO.	Croundy-t C:	Unlikely because site characteristics above are deficient, and/or this is a settled area or other area where beaver are routinely removed.	1	Adhere to there exists existing strictly do not we record induced to the control of the control
F50	Groundwater Strength of Evidence	Select first applicable choice: Springs are known to be present within the AA, or if groundwater levels have been monitored, that has demonstrated that groundwater primarily discharges to the wetland for longer periods during the year than periods when the wetland recharges the groundwater.	0	Adhere to these criteria strictly do not use personal judgment based on fen conditions, pH, or other evidence. Consult logorgaphic maps to detect breaks in Jospe described here. Rust deposits associated with groundwater seeps may be most noticeable as orange discoloration in ice formations along streams during early winter. [AM, CS, FA, FR, INV, NR, OE, PH, PRV, SFS, WC, WS]
		Most of the AA has a slope of >5%, or is very close to the base of a natural slope longer than 100 and much steeper than the slope of the AA, AND the pH of surface water, if known, is >5.5.	0	
FE 2	Internal Cradinat	Neither of above is true, although some groundwater may discharge to or flow through the AA. Or groundwater influx is unknown.	1	This is not the come as the charoline clane. It is the almost a difference between the second
F51	Internal Gradient	The gradient along most of the flow path within the AA is: <8 or the AA has no surface water outlet (not even seasonally).	1	This is not the same as the shoreline slope. It is the elevational difference between the AA's inlet and outlet, divided by the flow-distance between them and converted to percent. If available, use a
		<2% of the AA has no surface water outlet (not even seasonally). 2-5%.	0	clinometer to measure this. Free clinometer apps can be downloaded to smartphones. If the wetland is large (longer than -1 km), this may be estimated using Google Earth to determine the minimum and
		6-10%. >10%.	0	maximum elevation within the AA, then dividing by length and multiplying by 100. [CS, NR, OE, PR, SR, WBF, WBN, WS]

Assessment Area (AA) Results:

Wetland ID: PLE-W-01

Date: 19 September 2019

Observer: Matt Alexander

Latitude & Longitude (decimal degrees): 45.172159, 66.20506

Scores will appear below after data are entered in worksheets OF, F, and S. See Manual for definitions and descriptions of how scores were computed.

computed.						
Wetland Functions or Other Attributes:	Function Score (Normalised)	Function Rating	Benefits Score (Normalised)	Benefits Rating	Function Score (raw)	Benefits Score (raw)
Water Storage & Delay (WS)	8.29	Higher	0.37	Lower	8.10	0.45
Stream Flow Support (SFS)	0.00	Lower	0.00	Lower	0.00	0.00
Water Cooling (WC)	2.00	Moderate	0.00	Lower	1.33	0.00
Sediment Retention & Stabilisation (SR)	10.00	Higher	1.74	Lower	10.00	1.06
Phosphorus Retention (PR)	10.00	Higher	4.55	Moderate	10.00	4.44
Nitrate Removal & Retention (NR)	10.00	Higher	3.75	Moderate	10.00	4.44
Carbon Sequestration (CS)	3.57	Moderate			6.10	
Organic Nutrient Export (OE)	1.20	Lower			2.97	
Anadromous Fish Habitat (FA)	0.00	Lower	0.00	Lower	0.00	0.00
Resident Fish Habitat (FR)	0.00	Lower	0.00	Lower	0.00	0.00
Aquatic Invertebrate Habitat (INV)	1.16	Lower	4.16	Moderate	4.28	3.49
Amphibian & Turtle Habitat (AM)	5.24	Moderate	5.77	Moderate	6.07	5.59
Waterbird Feeding Habitat (WBF)	5.23	Moderate	5.00	Moderate	4.16	5.00
Waterbird Nesting Habitat (WBN)	3.61	Moderate	5.00	Moderate	3.09	5.00
Songbird, Raptor, & Mammal Habitat (SBM)	9.19	Higher	5.00	Moderate	7.62	5.00
Pollinator Habitat (POL)	9.58	Higher	0.00	Lower	7.71	0.00
Native Plant Habitat (PH)	4.97	Moderate	5.89	Moderate	5.09	5.11
Public Use & Recognition (PU)			3.07	Moderate		2.51
Wetland Sensitivity (Sens)			2.21	Lower		2.87
Wetland Ecological Condition (EC)			3.98	Moderate		6.53
Wetland Stressors (STR) (higher score means more stress)			8.23	Higher		5.28
Summary Ratings for Grouped Functions:						
HYDROLOGIC Group (WS)	0.00	Lower	0.37	Lower	8.10	0.45
WATER QUALITY SUPPORT Group (max+avg/2 of SR, PR, NR, CS)	10.00	Higher	3.95	Lower	9.51	3.88
AQUATIC SUPPORT Group (max+avg/2 of SFS, INV, OE, WC)	1.55	Lower	2.77	Moderate	3.21	2.33
AQUATIC HABITAT Group (max+avg/2 of FA, FR, AM, WBF, WBN)	4.03	Moderate	4.46	Moderate	4.37	4.36
TRANSITION HABITAT Group (max+avg/2 of SBM, PH, POL)	8.74	Higher	4.76	Moderate	7.26	4.24
WETLAND CONDITION (EC)			3.98	Moderate		6.53
WETLAND RISK (average of Sensitivity & Stressors)			5.22	Higher		4.07
	NOTE: A coor	e of 0 does not	moon the fune	tion or honofit i	a abaant from t	ho wotland It

NOTE: A score of 0 does not mean the function or benefit is absent from the wetland. It means only that this wetland has a capacity that is equal or less than the lowest-scoring one, for that function or benefit, from among the 98 NB calibration wetlands that were assessed previously.

Cover Page: Basic Description of Assessment	WESP-AC version 2
Site Name:	Burchill Wind Energy Project - PLE-W-03
Investigator Name:	Matt Alexander
Date of Field Assessment:	19 September 2019
Nearest Town:	Lorneville (west Saint John), New Brunswick
Latitude (decimal degrees):	45.163275
Longitude (decimal degrees):	66.199397
Is a map based on a formal on-site wetland delineation available?	Yes
Approximate size of the Assessment Area (AA, in hectares):	0.54
AA as percent of entire wetland (approx.). Attach sketch map if AA is smaller than the entire contiguous wetland.	
What percent (approx.) of the wetland were you able to visit?	90
What percent (approx.) of the AA were you able to visit?	100
Were you able to ask the site owner/manager about any of the questions?	No
Indicate here if you intentionally surveyed for rare plants, calciphile plants, or rare animals	Yes
Have you attended a WESP-AC training session? If so, indicate approximate month & year	Yes, September 2016
How many wetlands have you assessed previously using WESP-AC? (approx.	15
Comments about the site or this WESP-AC assessment (attach extra page if desired):	

Form OF (Office). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Conduct an assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answering many of the questions below will equire using these online map viewers:

vestigator: Matt Alexander

Google Earth Pro: https://www.google.com/earth/download/gep/agree.html

GeoNB: http://www.snb.ca/geonb1/ and http://www.snb.ca/geonb1/e/apps/apps-E.asp

Geons: http://www.sno.ca/geonol/ and http://www.sno.ca/geonol/e-apps/apps-e-asp
For most wetlands, completing this office data form will require 1-2 hours. For a list of functions to which each question pertains, see bracketed abbreviations in the Definitions/Explanations column. For detailed descriptions of each
WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus
Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding
Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity,

#	Indicators	Condition Choices	Data	Definitions/Explanations
F1	Province	Mark the province in which the AA is located by changing the 0 in the column next to it to a "1". Mark only one.		This determines to which province's calibration wetlands the raw score of any wetland is normalised
		New Brunswick	- 1	In the function and benefits models, it also triggers the automatic exclusion of indicators for which n spatial data exists in a particular province.
		Nova Scotia	0	spatial data exists in a particular province.
		Prince Edward Island	0	
		Newfoundland-Labrador	0	
2	Ponded Area Within 1 km.	The area of surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) within 1 km is:		"Adjacent" means not separated from the AA by a wide expanse (>50 m) of upland (including road >50 m wide). Include ponded areas likely to be hidden by wetland vegetation. If surface water
		<0.01 hectare (about 10 m x 10 m).	0	extends beyond 1 km, include only the part within 1 km. Do not include tidal areas. Measure the a from aerial imagery using Google Earth Pro (click on Ruler icon in toolbar, then Polygon in pop-up
		0.01 - 0.1 hectare.	0	menu). With the GeoNB viewer, enable the Wetlands layer, then measure with the Draw & Measu
		0.1 - 1 hectare.	0	tool after specifying Aerial as the Basemap. However, do not rely entirely on wetland boundaries
		1 to 10 hectares.	0	shown in online wetlands layers. [PH, SBM, WBN]
		10 to 100 hectares.	0	1
3	Ponded Water & Wetland Within 1 km.	>100 hectares. The area of wetlands and surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) with 1 km is:		See definition of adjacent in OF2. If the AA's wetland vegetation extends beyond 1 km, include on the part within 1 km. "Ponded" means not flowing in rivers or streams. [Sens, WBF]
		<0.01 hectare (about 10 m x 10 m).	0	
		0.01 - 0.1 hectare.	0	1
		0.1 - 1 hectare.	0	1
		1 to 10 hectares.	0	1
		10 to 100 hectares.	0	1
		>100 hectares.	- 1	
4	Size of Largest Nearby Vegetated Tract or	The largest vegetated patch or corridor that includes the AA's vegetation plus aladjacent upland vegetation that is not lawn, row crops, heavily grazed lands, conifer plantation is:		See definition of adjacent in OF2. Use Google Earth Pro's polygon ruler (as described above). Exclude conifer plantations only if it is obvious that trees were planted in rows. [AM, PH, SBM, Ser
	Corridor	<0.01 hectare (about 10 m x 10 m).	- 1	
		0.01 - 0.1 hectare.	0	
		0.1 - 1 hectare.	0	1
		1 to 10 hectares.	0	1
		10 to 100 hectares.	0	1
		100 to 1000 hectares.	0	
		>1000 hectares. [This is nearly always the answer in relatively undeveloped landscapes]	0	
	Distance to Large Vegetated Tract	The minimum distance from the edge of the AA to the edge of the closest vegetated land (but excluding row crops, lawn, conifer plantation) larger than 375 hectares (about 2 km on a side), is:		To measure distance, use Google Earth Pro (Ruler > Line tool). Or use Draw & Measure tool at GeoNB. The 375-ha criterion is from the Fundy Model Forest Project. [AM, PH, POL, SBM, Sens]
		450 m, and not separated from the 375-ha vegetated area by any width opawed roads, stretches of open water, row crops, bare ground, lawm, or impervious surface. Or the AA itself contains >375 ha of vegetation. [This is often the answer in relatively undeveloped landscap.]	1 es.]	
		<50 m, but completely separated from the 375-ha vegetated area by those features, and AA does not contain >375 ha of vegetation.	0	
		50-500 m, and not separated.	0	
		50-500 m, but separated by those features.	0	
		0.5 - 5 km, and not separated.	0	
		0.5 - 5 km, but separated by those features.	0	
,		None of the above (the closest patches or corridors which are that large are >5 km away).	0	
6	Herbaceous Uniqueness	The AA's vegetation cover is >10% herbaceous* but uplands within 5 km have <10% herbaceous cover. If so, enter "3" and continue to OF7. If not, consider: The AA's vegetation cover is >10% herbaceous* but uplands within 1 km have <10% herbaceous cover. If so enter "2" and continue to OF7. If not, consider: The AA's vegetation cover is >10% herbaceous* but uplands within 100 m of the wetland edge have <10% herbaceous cover. If so, enter "1". "NOTE: Exclude lawns, row crops, heavily grazed lands, forest, shrublands. Include moss as well as grasslike plants in this use of herbaceous vegetation".	. 0	For this question only, consider moss to be herbaceous vegetation. Determine the score by viewleral imagery in Google Earth after successively drawing or estimating the boundaries of the buff of 5 km, 1 km, and 100 m radius focused on the center of the AA. Circles of specified radius can in drawn in Google Earth Pro by clicking on the Ruler Icon, then Circle in the pop-up menu. [AMv., P. POLv., SBMv, WBFv, WBNv]
7	Woody Uniqueness	The AA's vegetation cover is >10% woody" but uplands within 5 km have <10% woody cover. If so, enter "3" and continue to OF8. If not,	0	See above. Do not consider conifer plantations to be forest if it is obvious that trees were planted i
		consider: The AA's vegetation is >10% woody" but uplands within 1 km have <10% woody cover. If so enter "2" and continue to OF8. If not, consider:		rows. [AMv, PHv, POLv, SBMv]
		The AA's vegetation is >10% woody" but uplands within 100 m of the wetland edge have <10% woody cover. If so, enter "1" [" NOTE: woody cover = trees & shrubs taller than 1 m.]		
	ocal Vegetated Cover	Draw a 5-km radius circle measured from the center of the AA. Ignoring all permanent water in the circle, the percent of the remaining ar that is wooded or unmanaged herbaceous vegetation (NOT lawn, row crops, bare or heavily grazed land, clearcuts, or conifer plantations		in Google Earth, draw the 5 km buffer and then estimate land cover percentages, or do GIS analy of an appropriate land cover layer. [AM, PH, POL, SBM, Sens]
8	Percentage	is:		
8	-	is: <5% of the land.	0

0512	IARI-HIE- A	>500 m.	0	In AID could be Welled I have to Co-AID (documents) to the company of the country		
OF12	Wildlife Access	Draw a circle of radius of 5 km from the center of the AA. If mammals and amphibians can move from the center of the AA to ALL other separate wetlands and ponds located within the circle without being forced to cross pavement (any width), lawns, bare ground, and/or marine waters, mark 1= yes can move to all, 0= no. Change toblank if there are no other wetlands within 5 km.	0	In NB, enable the Wetlands layer in GeoNB (despite its omissions) to show surrounding wetlands and roads, while estimating the location of the 5 km circle (or draw the 5 km circle in Google Earth Pro using the Circle tool and compare). Evaluate using Google Earth, being cautious to search for roads hidden under forest canopy. (AM, SBM, STR)		
OF13	Distance to Ponded	The distance from the AA center to the closest (but separate) ponded water body visible in GoogleEarth imagery is:		In Google Earth, zoom in closely to examine the surrounding landscape for ponds, lakes, and		
	ustance to Ponded Water			wetlands that appear to be permanently flooded. Enable the GeoNB viewer's Wetlands layer as well.		
		<50 m, and not separated by any width of paved roads, stretches of open water, row crops, lawn, bare ground, or impervious surface.	0	[AM, PH, SBM, Sens, WBF, WBN]		
		<50 m, but completely separated by those features.	0			
		50-500 m, and not separated.	0			
		50-500 m, but separated by those features.	0			
		0.5 - 1 km, and not separated.	1			
		0.5 - 1 km, but separated by those features.	0			
		None of the above (the closest patches or corridors that large are >1 km away).	0			
OF14	Distance to Large	The distance from the AA center to the closest (but separate)non-tidal body of water that is ponded during most of the year and islarger		Determine this by viewing aerial imagery in Google Earth. [Sens, WBF, WBN]		
	Ponded Water	than 8 hectares during most of a normal year is:				
		<100 m.	0			
		100 m - 1 km.	0			
		1 -2 km.	0			
		2-5 km.	- 1			
		5-10 km.	0			
		>10 km.	0			
OF15	Tidal Proximity	The distance from the AA edge to the closesttidal water body (regardless of its salinity) is:		In Google Earth, measure the distance to the ocean (including Bay of Fundy) or tidal river, whichever		
		<100 m.	0	is closer. If you need to see how far upriver a river is tidal, see the KMZ file provided with this calculator for NB (NB Headtide). Points shown in those files are only an approximation, so local		
		100 m - 1 km.	1	information if available may be preferable. [FA, WBF]		
		1 - 5 km.	0	1		
		5-10 km.	0			
		10-40 km.	0			
		>40 km.	0			
OF16	Upland Edge Contact	Select one:		[NR, SBM, Sens]		
		The AA has no upland edge (or upland is <1% of perimeter). The AA is entirely surrounded by (& contiguous with) other wetlands or water	. 0			
		1-25% of the AA's perimeter abuts upland (including filled areas). The rest adjoins other wetlands or water that is mostly wider than the AA				
		25-50% of the AA's perimeter abuts upland. The rest adjoins other wetlands or water that is mostly wider than the AA.	0			
		50-75% of the AA's perimeter abuts upland. The rest adjoins other wetlands or water that is mostly wider than the AA. More than 75% of the AA's perimeter abuts upland. Any remainder adjoins other wetlands or water that is mostly wider than the AA.This will be true for most assessments done with WESP-AC.	1			
	Flood Damage from Non	Within 5 km downstream or downstope of the AA (select first true choice):		In the GeoNB map viewer: click on "More" in upper right, then "Flood Information". Expand the menu

Form F (Field). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Walk for no less than 10 minutes from the wetland edge towards its core, in the part of the AA that is proposed for alteration. If no alteration is proposed, walk in a portion that appears to be most representative of the wetland overall. Walk only where it is safe and legal to do so. Conduct the assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answer these questions primarily based on your onsite observations and interpretations. Do not write in shaded parts of this data form. Answering some questions accurately may require conferring with the landowner or other knowledgable persons and/or reviewing aerial imagery. For most wetlands, completing this field data form will require 1-2 hours on a site. For a list of functions to which each question pertains, see the accompanying Interpretations form. For detailed descriptions of each WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage & Delay, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity, STR= Stressors.

#	Indicators	Condition Choices	Data	Definitions/Explanations
1	Wetland Type	Follow the key below and mark the ONE row that best describes MOST of the vegetated part of the AA:		Ericaceous shrubs are ones in the heather family (Ericaceae). Most have leathery evergreen leaves. They include rhododendron, azalea, swamp laurel, leatherleaf, Labrador tea, and others. Most require
		A. Moss and/or lichen cover more than 25% of the ground. Often dominated by ericaceous shrubs (e.g., Labrador tea) or other acid-tolerant plants (e.g., bog cranberry, pitcher plant, sundew, orchids). Substate is mostly undecomposed peat. Choose between A1 and A2 and mark the choice with a 1 in their adjoining column. Otherwise go to 8 below.		acidic soil. Although not in the family Ericaceae, sweetgale (Myrica gale) should be counted also. [AM, CS, FA, FR, INV, NR, OE, PH, Sens, SFS, WBF, WBN]
		A1. Surface water is usually absent or, if present, pH is typically <4.5 and conductivity is usually <100 μS/cm (<64 ppm TDS). Trees are absent or nearty so. Sedge cover usually sparse or absent but cottongrass and/or lichen cover may be extensive, as well as cloudberry, lingonberry, sheep laurel, and a sedge (Carex rarillora). Welland surface and surrounding landscape are seldom sloping and welland often is domed (convex). Inlet and outlet channels are usually absent. If known, pH of peat is <4.0.	0	
		A2. Not A1. Surface water, if present, has pH typically >4.5 and conductivity is usually >100 µS/cm (>64 ppm TDS). Sedge cover is usually extensive, and/or tree and fall shrub cover is extensive. Sometimes at toe of slope or edge of water body. An exit channel is usually present. Wetter than A1 and peat depth may be shallower (<2 m).	0	
		B. Moss and/or lichen cover less than 25% of the ground. Soil is mineral or decomposed organic (muck). Choose between B1 and B2 and mark the choice with a 1 in their adjoining column:		
		B1. Trees and shrubs taller than 1 m comprise more than 25% of the vegetated cover. Surface water is mostly absent or inundates the vegetation only seasonally (e.g., vernal pools or floodplain).	1	
		B2. Not B1. Tree & tall shrubs comprise less than than 25% of the vegetated cover. Vegetation is mostly herbaceous, e.g., cattail, bulrush, burreed, pond lily, horsetail. Surface water may be extensive and fluctuates seasonally, being either persistent or drying up partly or entirely.	0	
AA sh includ " adja descri	ould also include part of a e the open water part ad, cent " is used synonymo, bed features along their a	he AA should include all persistent waters in ponds smaller than 8 hectares (~283 m on a side) that are adjacent to the AA. The the water area of adjacent ponded water larger than 8 ha and adjacent rivers wider than 20 m. Specifically, the AA should facent to welland vegetation and equal in width to the average width of that vegetated zone. Throughout this data form, usly with abutting, adjoining, bordering, contiguous and means no upland (mammade or natural) completely separates the directly shared edge. Features joined only by a channel are not necessarily considered to be adjacent a large portion of their res do not have to be hydrologically connected in order to be considered adjacent.		
2	Wetland Types - Adjoining or Subordinate	If the AA is smaller than 1 ha, mark all other types that occupy more than 1% of the vegetated AA. If the AA is larger than 1 ha, mark all other types which are within or adjacent to the AA and occupy more than 1 ha, as visible from the AA or as interpreted from aerial imagery. Do not mark again the type marked in F1.		1 hectare is 10,000 sq. m or about 2.5 acres. It could have dimensions of 100 m by 100 m, 1000 m by 10 m, or similar. [AM, INV, SBM, WBF]
		A1. A2.	0	
		B1.	0	
3	Woody Height & Form	B2. Following EACH row below, indicate with a number code the percentage of the living vegetation in the AA which is occupied by that feature (6	0	Deciduous shrubs in this region usually include buttonbush, Labrador tea, bayberry (Morella),
	Diversity	#. 95%, 5 # 75-95%, 4 # 50-75%, 3 # 25-05%, 2 # 5-25%, 1 # <5%, 0 if none). If the vegetated part of the AA is largely herbaceous (non-wood) vegetation, these percentages should not sum to 100%.	-	huckleberry, cranberry, cloudberry, sweetgale, alder, willow, birch, ash, dogwood, and a few others. If you assigned a code of 3 or higher to any of the first four choices and the ground cover beneath the trees/shrubs is <25% moss, then question F1 might be "B1". [CS, INV, NR, PH, POL, SBM, Sens]
		coniferous trees (may include tamarack) taller than 3 m. deciduous trees taller than 3 m.	5 1	
		coniferous or ericaceous shrubs or trees 1-3 m tall not directly below the canopy of trees. deciduous shrubs or trees 1-3 m tall not directly below the canopy of trees.	2	
		coniferous or ericaceous shrubs <1 m tall not directly below the canopy of taller vegetation.	1	
Note :	If none of top 4 rows in	deciduous shrubs or trees <1 m tall (e.g., deciduous seedlings) not directly below the canopy of taller vegetation. F3 was marked 2 or greater, SKIP to F9 (N fixers).	1	
4	Dominance of Most	Determine which two woody plant species comprise the greatest portion of the low (<3 m) woody cover . Then choose one:		[PH, POL, SBM, Sens]
	Abundant Shrub Species	those species together comprise > 50% of such cover.	1	
5	Woody Diameter Classes	those species together do not comprise > 50% of such cover. Mark ALL the types that comprise > 5% of the woody canopy cover in the AA or > 5% of the wooded areas (if any) along its upland edge (perimeter). The edge should include only the trees whose canopies extend into the AA.	0	Estimate the diameters at chest height. If small-diameter trees are overtopped (shaded) by larger ones, visualise a "subcanopy" at the average height of the smaller-dbh trees, to serve as a basis for t
		coniferous, 1-9 cm diameter and >1 m tall. broad-leaved deciduous 1-9 cm diameter and >1 m tall.	1	minimum 5% canopy requirement in this question. The trees and shrubs need not be wetland species [AM, CS, POL, SBM, Sens, WBN]
		conferous, 10-19 cm diameter.	1	
		broad-leaved deciduous 10-19 cm diameter.	1	
		coniferous, 20-40 cm diameter. broad-leaved deciduous 20-40 cm diameter.	1	
		coniferous, >40 cm diameter.	1	
6	Height Class	broad-leaved deciduous >40 cm diameter. Follow the key below and mark the ONE row that best describes MOST of the AA:	1	[AM, INV, NR, PH, SBM, Sens]
	Interspersion	A. Neither the vegetation taller than 1 m nor the vegetation shorter than that comprise >70% of the vegetated part of the AA. They each comprise 30-70%. Choose between A1 and A2 and mark the choice with a 1 in the adjoining column. Otherwise go to B below.		
		A1. The two height classes are mostly scattered and intermixed throughout the AA.	0	
		A2. Not A1. The two height classes are mostly in separate zones or bands, or in proportionately large clumps. B. Either the vegetation shorter than 1 m comprises >70% of the vegetated part of the AA, or the vegetation taller than that does. One size	0	
		class might even be totally absent. Choose between B1 and B2 and mark the choice with a 1 in the adjoining column:		
		B1. The less prevalent height class is mostly scattered and intermixed within the prevalent one. B2. Not B1. The less prevalent height class is mostly located apart from the prevalent one, in separate zones or clumps, or is completely	0	
7	Large Snags (Dead	absent. The number of large snags (diameter >20 cm) in the AA plus adjacent upland area within 10 m of the wetland edge is:		Snags are dead standing trees that often (not always) lack bark and foliage. Include only ones that a
	Standing Trees)	None, or fewer than 8/ hectare which exceed this diameter.	0	at least 2 m tall. [POL, SBM, WBN]
		Several (>8/hectare) and a pond, lake, or slow-flowing water wider than 10 m is within 1 km.	0	
	Downed Weed	Several (>8/hectare) but above not true. The number of downed used pieces leaves than 2 m and with diameter >10 cm, and not possistently submorated in:	1	Evaluda tamparany "hum pilos " IAM IMI/ DOL SPAII
8	Downed Wood	Several (>8/hectare) but above not true. The number of downed wood pieces longer than 2 m and with diameter >10 cm, and not persistently submerged, is: Few or none that meet these criteria.	0	Exclude temporary "burn piles." [AM, INV, POL, SBM]

F37	Interspersion of	During most of the part of the growing season when water is present, the spatial pattern of emergent vegetation within the water is mostly:		[AM, FA, FR, INV, NR, OE, PH, PR, SBM, SR, WBF, WBN]
	Emergents & Open Water	Scattered. More than 30% of such vegetation forms small islands or corridors surrounded by water.	0	
	water	Intermediate.	0	
		Clumped. More than 70% of such vegetation is in bands along the wetland perimeter or is clumped at one or a few sides of the surface water area.	0	
F38	Persistent Deepwater	If the deepest patch of surface water (flowing or ponded) in or directly adjacent to the AA is mostly deeper than 0.5 m for >2 weeks during the	0	
F39	Area Non-vegetated Aquatic	growing season, enter "1" and continue. If not, enter "0" and SKIP to F42.(Connection). During most of the growing season and in waters deeper than 0.5 m, the cover for fish, aquatic invertebrates, and/or amphibians that is		For this question, consider only the wood that is at or above the water surface. Estimates of underwater
137	Cover Cover	provided NOT by living vegetation, but by accumulations of dead wood and undercut banks is:		wood based only on observations from terrestrial viewpoints are unreliable so should not be attempted.
		Little or none. Intermediate.	0	[AM, FA, FR, INV]
		Extensive.	0	
F40	Isolated Island	The AA contains (or is part of) an island or beaver lodge within a lake, pond, or river, and is isolated from the shore by water depths > 1 m on all sides during an average June. The island may be solid, or it may be a floating vegetation mat that is sufficiently large and dense to support a waterbird nest.	0	[WBN]
	Floating Algae & Duckweed	Al some time of the year, mats of algae and/or duckweed are likely to cover >50% of the AA's otherwise-unshaded water surface, or blankel >50% of the underwater substrate. If true, enter "1" in next column. If untrue or uncertain, enter "0".	0	[EC, PR, WBF]
F42	Channel Connection & Outflow Duration	The most persistent surface water connection (outlet channel or pipe, ditch, or overbank water exchange) between the AA and a downslope stream network is: [Note: If the AA represents only part of a welland, answer this according to whichever is the least permanent surface connection: the one between the AA and the rest of the wetland, or the surface connection between the wetland and the downslope stream network.] Persistent (surface water flows out for >9 months/year).	0	Consider the connection regardless of whether the surface water is frozen. The "downslope stream network" could consist of ditches, rivers, ponds, or lakes which eventually connect to the ocean. If this cannot be determined while visiting the AA, consult topographic maps perhaps by viewing these online with Toporama (http://atlas.nrcan.gc.ca/toporama/en/index.html) [CS, FA, FR, NR, OE, PR, Sens, SFS SR, WCV, WS]
		Seasonal (surface water flows out for 14 days to 9 months/year, not necessarily consecutive).	1	
		Temporary (surface water flows out for <14 days, not necessarily consecutive). None but maps show a stream network downslope from the AA and within a distance that is less than the AA's length. SKIP to F47 (pH	0	
		Measurement).		
		No surface water flows out of the wetland except possibly during extreme events (-once per 10 years). Or, water flows only into a wetland, ditch, or lake that lacks an outlet. SKIP to F47 (pH Measurement).	0	
F43	Outflow Confinement	During major runoff events, in the places where surface water exits the AA or connected waters nearby, the water:		"Major runoff events" would include biennial high water caused by storms and/or rapid snowmelt. [CS, NR, OE, PR, Sens, SR, STR, WS]
		Mostly passes through a pipe, culvert, narrowly breached dike, berm, beaver dam, or other partial obstruction (other than natural topography) that does not appear to drain the wetland artificially during most of the growing season.	0	
		Leaves through natural exits (channels or diffuse outflow), not mainly through artificial or temporary features.	1	
		Is exported more quickly than usual due to ditches or pipes within the AA or connected to its outlet, or within 10 m of the AA's edge, which drain the wetland artificially, or water is pumped out of the AA.	0	
F44	Tributary Channel	At least once annually, surface water from a tributary channel that is >100 m long moves into the AA. Or, surface water from a larger permanent water body adjacent to the AA spills into the AA. If it enters only via a pipe, that pipe must be fed by a mapped stream or lake further upslope. If no, SKIP to F47 (pH Measurement).	0	If inlet tributaries cannot be searched for due to inaccessibility of part of the AA, follow suggestions in F42 above. [NRv, PH, PRv, SRv]
F45	Input Water Temperature	Based on lack of shade, water source characteristics, or actual temperature measurements, the inflow is likely to be warmer than surface water in the AA during part of most years. Enter 1= yes, 0= no.	0	[WCv]
F46	Throughflow	During its travel through the AA at the time of peak annual flow, water arriving in channels: [select only the ONE encountered by most of the incoming water].		[FA, FR, INV, NR, OE, PR, SR, WS]
	Resistance	Does not bump into many plant stems as it travels through the AA. Nearly all the water continues to travel in unvegetated (often incised)	0	
		channels that have minimal contact with wetland vegetation, or through a zone of open water such as an instream pond or lake.		
		Bumps into herbaceous vegetation but mostly remains in fairly straight channels.	0	
		Bumps into herbaceous vegetation and mostly spreads throughout, or is in widely meandering, multi-branched, or braided channels.	0	
		Bumps into tree trunks and/or shrub stems but mostly remains in fairly straight channels. Bumps into tree trunks and/or shrub stems and follows a fairly indirect path from entrance to exit (meandering, multi-branched, or braided).	0	
F47	pH Measurement	The pH in most of the AA's surface water:		Preferably, measure this in larger areas of ponded surface water within the AA, or in streams that have passed through (not along) most of the AA. Unless surface water is completely absent, do not dig holes
		Was measured, and is: [enter the reading in the column to the right.] Was not measured but surface water is present and is darkly tea-coloured. Or if no surface water, then mosses and plants that indicate	0	or make depressions in peat in order to provide water for this measurement. Avoid measuring near
		peatland (e.g., Labrador tea) are prevalent. Enter "1".	0	roads or in puddles formed only by recent rain. [AM, FA, FR, NR, WBF, PH, PR, Sens, WBF, WBN]
F48	TDS and/or	Neither of above. Enter "1". The TDS (total dissolved solids) or conductivity off the AA's surface water is: (select the first true row with information):	1	See above for measurement guidance. [FR, INV, NRv, PH, PRv, Sens]
	Conductivity	TDS is: [Enter the reading in ppm or mg/L in the column to the right, if measured, or answer next row.]		
		Conductivity is [Enter the reading in µS/cm in the column to the right.] Was not measured, but plants that indicate saline conditions cover much of the vegetated AA. Enter "1".	0	
		Neither of above	1	
F49	Beaver Probability	Use of the AA by beaver during the past 5 years is (select most applicable ONE):		[FA, FR, PH, SBM, Sens, WBF, WBN]
		Evident from direct observation or presence of gnawed limbs, dams, tracks, dens, lodges, or extensive stands of water-killed trees (snags).	0	
		Likely based on known occurrence in the region and proximity to suitable habitat, which may include: (a) a persistent freshwater wetland, pond, or lake, or a perennial low or mid-gradient (<10%) channel, and (b) a corridor or multiple stands of hardwood trees and shrubs in vegetated areas near surface water.	0	
F50	Groundwater Strength	Unlikely because site characteristics above are deficient, and/or this is a settled area or other area where beaver are routinely removed. Select first applicable choice:	1	Adhere to these criteria strictly do not use personal judgment based on fen conditions, pH, or other
1 30	of Evidence	Select first applicable choice: Springs are known to be present within the AA, or if groundwater levels have been monitored, that has demonstrated that groundwater primarily discharges to the wetland for longer periods during the year than periods when the wetland recharges the groundwater.	0	Agnere to these criteria strictly - oo hot use personal judgment assed on ren conditions, pH, or other evidence. Consult lopographic maps to detect breaks in slope described here. Rust deposits associated with groundwater seeps may be most noticeable as orange discoloration in ice formations along streams during early winter. [AM, CS, FA, FR, INV, NR, OE, PH, PRv, SFS, WC, WS]
		Most of the AA has a slope of >5%, or is very close to the base of a natural slope longer than 100 and much steeper than the slope of the AA, AND the pH of surface water, If known, is >5.5.	0	
F51	Internal Gradient	Neither of above is true, although some groundwater may discharge to or flow through the AA. Or groundwater influx is unknown. The gradient along most of the flow path within the AA is:	1	This is not the same as the shoreline slope. It is the elevational difference between the AA's inlet and
		The gradient along most of the now pain within the AATS. The AA has no surface water outlet (not even seasonally).	1	outlet, divided by the flow-distance between them and converted to percent. If available, use a
		2-5%.	0	clinometer to measure this. Free clinometer apps can be downloaded to smartphones. If the wetland is large (longer than –1 km), this may be estimated using Google Earth to determine the minimum and
		6-10%. >10%.	0	maximum elevation within the AA, then dividing by length and multiplying by 100. [CS, NR, OE, PR, SR, WBF, WBN, WS]
		ions: If the AA lacks an upland edge, evaluate based on the AA's entire perimeter, and moving outward into whatever areas are		
adjace F52	nt. In many situations, the Vegetated Buffer as %	nese questions are best answered by measuring from aerial images. Within a zone extending 30 m laterally from the AA's edge with upland and/or other wetlands, the percentage that contains perennial		[AM, FA, FR, INV, NRv, PH, POL, PRv, SBM, Sens, SRv, STR, WBN]

FieldS form Non-tidal 2

Assessment Area (AA) Results:

Wetland ID: PLE-W-03

Date: 19 September 2019

Observer: Matt Alexander

Latitude & Longitude (decimal degrees): 45.163275, 66.199397

Scores will appear below after data are entered in worksheets OF, F, and S. See Manual for definitions and descriptions of how scores were computed.

сотралеа.						
Wetland Functions or Other Attributes:	Function Score (Normalised)	Function Rating	Benefits Score (Normalised)	Benefits Rating	Function Score (raw)	Benefits Score (raw)
Water Storage & Delay (WS)	4.97	Moderate	0.87	Lower	5.56	0.95
Stream Flow Support (SFS)	1.88	Lower	4.86	Moderate	1.00	2.84
Water Cooling (WC)	0.00	Lower	0.00	Lower	0.00	0.00
Sediment Retention & Stabilisation (SR)	8.38	Higher	0.82	Lower	8.89	0.50
Phosphorus Retention (PR)	5.03	Higher	4.55	Moderate	6.47	4.44
Nitrate Removal & Retention (NR)	2.77	Moderate	3.75	Moderate	5.54	4.44
Carbon Sequestration (CS)	7.78	Higher			7.92	
Organic Nutrient Export (OE)	3.62	Moderate			4.25	
Anadromous Fish Habitat (FA)	0.00	Lower	0.00	Lower	0.00	0.00
Resident Fish Habitat (FR)	0.00	Lower	0.00	Lower	0.00	0.00
Aquatic Invertebrate Habitat (INV)	4.95	Moderate	0.88	Moderate	5.62	1.72
Amphibian & Turtle Habitat (AM)	2.67	Lower	2.38	Moderate	4.71	3.54
Waterbird Feeding Habitat (WBF)	0.00	Lower	0.00	Lower	0.00	0.00
Waterbird Nesting Habitat (WBN)	0.00	Lower	0.00	Lower	0.00	0.00
Songbird, Raptor, & Mammal Habitat (SBM)	6.77	Moderate	5.00	Moderate	5.61	5.00
Pollinator Habitat (POL)	8.22	Higher	0.00	Lower	6.62	0.00
Native Plant Habitat (PH)	3.32	Lower	4.70	Moderate	4.42	4.08
Public Use & Recognition (PU)			4.33	Moderate		3.41
Wetland Sensitivity (Sens)			0.00	Lower		1.94
Wetland Ecological Condition (EC)			4.94	Moderate		7.08
Wetland Stressors (STR) (higher score means more stress)			4.14	Moderate		3.78
Summary Ratings for Grouped Functions:						
HYDROLOGIC Group (WS)	1.88	Lower	0.87	Lower	5.56	0.95
WATER QUALITY SUPPORT Group (max+avg/2 of SR, PR, NR, CS)	6.89	Higher	3.79	Lower	8.05	3.79
AQUATIC SUPPORT Group (max+avg/2 of SFS, INV, OE, WC)	3.78	Lower	3.39	Moderate	4.17	2.18
AQUATIC HABITAT Group (max+avg/2 of FA, FR, AM, WBF, WBN)	1.60	Lower	1.43	Lower	2.83	2.12
TRANSITION HABITAT Group (max+avg/2 of SBM, PH, POL)	7.16	Moderate	4.12	Moderate	6.09	4.01
WETLAND CONDITION (EC)			4.94	Moderate		7.08
WETLAND RISK (average of Sensitivity & Stressors)			2.07	Lower		2.86
	NIOTE A				1 16 1	

NOTE: A score of 0 does not mean the function or benefit is absent from the wetland. It means only that this wetland has a capacity that is equal or less than the lowest-scoring one, for that function or benefit, from among the 98 NB calibration wetlands that were assessed previously.

Cover Page: Basic Description of Assessment	WESP-AC version 2
Site Name:	Burchill Wind Energy Project - PLW-W-01
Investigator Name:	Matt Alexander
Date of Field Assessment:	19 September 2019
Nearest Town:	Lorneville (west Saint John), New Brunswick
Latitude (decimal degrees):	45.171674
Longitude (decimal degrees):	66.20564
ls a map based on a formal on-site wetland delineation available?	Yes
Approximate size of the Assessment Area (AA, in hectares):	0.37
AA as percent of entire wetland (approx.). Attach sketch map if AA is smaller than the entire contiguous wetland.	
What percent (approx.) of the wetland were you able to visit?	100
What percent (approx.) of the AA were you able to visit?	100
Were you able to ask the site owner/manager about any of the questions?	No
Indicate here if you intentionally surveyed for rare plants, calciphile plants, or rare animals	Yes
Have you attended a WESP-AC training session? If so, indicate approximate month & year	Yes, September 2016
How many wetlands have you assessed previously using WESP-AC? (approx.	15
Comments about the site or this WESP-AC assessment (attach extra page if desired):	

Form OF (Office). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Conduct an assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answering many of the questions below will require using these online map viewers:

Google Earth Pro: https://www.google.com/earth/download/gep/agree.html

GeoNB: http://www.snb.ca/geonb1/ and http://www.snb.ca/geonb1/e/apps/apps-E.asp

IT1	Indicators	Condition Choices	Data	Definitions/Explanations
F1	Province	Mark the province in which the AA is located by changing the 0 in the column next to it to a *1". Mark only one.		This determines to which province's calibration wetlands the raw score of any wetland is normalise
		New Brunswick	1	In the function and benefits models, it also triggers the automatic exclusion of indicators for which spatial data exists in a particular province.
		Nova Scotia	0	spatial data exists in a particular province.
		Prince Edward Island	0	1
		Newfoundland-Labrador	0	1
2	Ponded Area Within 1 km.	The area of surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) within 1 km is:		"Adjacent" means not separated from the AA by a wide expanse (>50 m) of upland (including roa >50 m wide). Include ponded areas likely to be hidden by wetland vegetation. If surface water
		<0.01 hectare (about 10 m x 10 m).	0	extends beyond 1 km, include only the part within 1 km. Do not include tidal areas. Measure the
		0.01 - 0.1 hectare.	0	from aerial imagery using Google Earth Pro (click on Ruler icon in toolbar, then Polygon in pop-up
		0.1 - 1 hectare.	- 1	menu). With the GeoNB viewer, enable the Wetlands layer, then measure with the Draw & Measu tool after specifying Aerial as the Basemap. However, do not rely entirely on wetland boundaries
		1 to 10 hectares.	0	shown in online wetlands layers. [PH, SBM, WBN]
		10 to 100 hectares.	0	
		>100 hectares.	0	1
3	Ponded Water & Wetland Within 1 km.	The area of wetlands and surface water ponded during most of the growing season that is both (1) in or adjacent to the AA and (2) within is:	n	See definition of adjacent in OF2. If the AA's wetland vegetation extends beyond 1 km, include on the part within 1 km. "Ponded" means not flowing in rivers or streams. [Sens, WBF]
		<0.01 hectare (about 10 m x 10 m).	0	1
		0.01 - 0.1 hectare.	0	1
		0.1 - 1 hectare.	0	
		1 to 10 hectares.	1	
		10 to 100 hectares.	0	
		>100 hectares.	0	
4	Size of Largest Nearby Vegetated Tract or	The largest vegetated patch or corridor that includes the AA's vegetation plus aladjacent upland vegetation that is not lawn, row crops, heavily grazed lands, conifer plantation is:		See definition of adjacent in OF2. Use Google Earth Pro's polygon ruler (as described above). Exclude conifer plantations only if it is obvious that trees were planted in rows. [AM, PH, SBM, Se
	Corridor	<0.01 hectare (about 10 m x 10 m).	0	1
		0.01 - 0.1 hectare.	0	1
		0.1 - 1 hectare.	0	1
		1 to 10 hectares.	0	1
		10 to 100 hectares.	0	1
		100 to 1000 hectares.	0	1
		>1000 hectares. [This is nearly always the answer in relatively undeveloped landscapes]	1	
5	Distance to Large Vegetated Tract	The minimum distance from theedge of the AA to the edge of the closest <i>vegetated land</i> (but excluding row crops, lawn, conifer plantation) larger than 375 hectares (about 2 km on a side), is:		To measure distance, use Google Earth Pro (Ruler > Line tool). Or use Draw & Measure tool at GeoNB. The 375-ha criterion is from the Fundy Model Forest Project. [AM, PH, POL, SBM, Sens
		<50 m, and not separated from the 375-ha vegetated area by any width olpaved roads, stretches of open water, row crops, bare ground, lawn, or impervious surface. Or the AA itself contains >375 ha of vegetation. [This is often the answer in relatively undeveloped landscape	1 s.]	
		< 50 m, but completely separated from the 375-ha vegetated area by those features, and AA does not contain > 375 ha of vegetation.	0	
		50-500 m, and not separated.	0	
		50-500 m, but separated by those features.	0	1
		0.5 - 5 km, and not separated.	0	
		0.5 - 5 km, but separated by those features.	0	1
		None of the above (the closest patches or corridors which are that large are >5 km away).	0	
6	Herbaceous Uniqueness	The AA's vegetation cover is > 10% herbaceous* but uplands within 5 km have <10% herbaceous cover. If so, enter "3" and continue to OF7. If not, consider: The AA's vegetation cover is >10% herbaceous* but uplands within 1 km have <10% herbaceous cover. If so enter "2" and continue to OF7. If not, consider: The AA's vegetation cover is >10% herbaceous* but uplands within 100 m of the wetland edge have <10% herbaceous cover. If so, enter "1". "NOTE: Exclude lawns, row crops, heavily grazed lands, forest, shrublands. Include moss as well as grasslike plants in this use of herbaceous vegetation"]	0	For this question only, consider moss to be herbaceous vegetation. Determine the score by view areal imagery in Google Earth after successively drawing or estimating the boundaries of the but of 5 km, 1 km, and 100 m radius focused on the center of the AA. Circles of specified radius can drawn in Google Earth Pro by clicking on the Ruler icon, then Circle in the pop-up menu. [AMv, F POLv, SBMv, WBFv, WBNv]
7	Woody Uniqueness	The AA's vegetation cover is >10% woody" but uplands within 5 km have <10% woody cover. If so, enter "3" and continue to OF8. If not,	0	See above. Do not consider conifer plantations to be forest if it is obvious that trees were planted
		consider: The AA's vegetation is >10% woody* but uplands within 1 km have <10% woody cover. If so enter "2" and continue to OF8. If not, consider:		rows. [AMv, PHv, POLv, SBMv]
		The AATs vegetation is >10% woody" but uplands within 100 m of the wetland edge have <10% woody cover. If so, enter "1" [" NOTE: woody cover = trees & shrubs taller than 1 m.]		
	Local Vegetated Cover Percentage	Draw a 5-km radius circle measured from the center of the AA. Ignoring all permanent water in the circle, the percent of the remaining are that is wooded or unmanaged herbaceous vegetation (NOT lawn, row crops, bare or heavily grazed land, clearcuts, or conifer plantations)		in Google Earth, draw the 5 km buffer and then estimate land cover percentages, or do GIS analy of an appropriate land cover layer. [AM, PH, POL, SBM, Sens]

Or use the GeoNB's Draw & Measure tool> Freehand Line to draw and measure the route Settlements (click on Place Names in menu) or other areas not close to mapped settlements but

OF11	Distance to Nearest	From the center of the AA, the distance to the nearest maintained public road (dirt or paved) is:		Determine this by viewing aerial imagery in Google Earth and measuring with the Ruler>Line tool. Or
	Maintained Road	<10 m.	0	use the GeoNB's Draw Line tool. [AM, FAv, FRv, NRv, PH, PU, SBM, STR, WBN]
		10 - 25 m.	- 1	
		25 - 50 m.	0	
		50 - 100 m.	0	
		100 - 500 m. >500 m.	0	
OF12	Wildlife Access	Draw a circle of radius of 5 km from the center of the AA. If mammals and amphibians can move from the center of the AA to ALL other	U	In NB, enable the Wetlands layer in GeoNB (despite its omissions) to show surrounding wetlands an
01.12	Trialio / tooss	separate wetlands and ponds located within the circle without being forced to cross pavement (any width), lawns, bare ground, and/or marine waters, mark 1 = yes can move to all, 0 = no. Change toblank if there are no other wetlands within 5 km.	0	roads, while estimating the location of the 5 km circle (or draw the 5 km circle in Google Earth Pro using the Circle tool and compare). Evaluate using Google Earth, being cautious to search for roads hidden under forest canopy. [AM, SBM, STR]
OF13		The distance from the AA center to the closest (but separate) ponded water body visible in GoogleEarth imagery is:		in Google Earth, zoom in closely to examine the surrounding landscape for ponds, lakes, and
	Water	<50 m, and not separated by any width of paved roads, stretches of open water, row crops, lawn, bare ground, or impervious surface.	0	wellands that appear to be permanently flooded. Enable the GeoNB viewer's Wetlands layer as wel [AM, PH, SBM, Sens, WBF, WBN]
		<50 m, but completely separated by those features.	0	
		50-500 m, and not separated.	0	
		50-500 m, but separated by those features. 0.5 - 1 km. and not separated.	0	
		0.5 - 1 km, but separated by those features.	1	
		None of the above (the closest patches or corridors that large are >1 km away).	0	
OF14		The distance from the AA center to the closest (but separate)non-tidal body of water that is ponded during most of the year and islarger		Determine this by viewing aerial imagery in Google Earth. [Sens, WBF, WBN]
	Ponded Water	than 8 hectares during most of a normal year is:		
		<100 m. 100 m - 1 km.	0	
		1 -2 km.	0	
		2-5 km.	1	
		5-10 km.	0	
		>10 km.	0	
OF15	Tidal Proximity	The distance from the AA edge to the closesttidal water body (regardless of its salinity) is:		In Google Earth, measure the distance to the ocean (including Bay of Fundy) or tidal river, whichever
		<100 m.	0	is closer. If you need to see how far upriver a river is tidal, see the KMZ file provided with this calculator for NB (NB Headtide). Points shown in those files are only an approximation, so local
		100 m - 1 km.	1	information if available may be preferable. [FA, WBF]
		1 - 5 km.	0	
		5-10 km.	0	
		10-40 km.	0	
OF16	Upland Edge Contact	Select one:	0	[NR, SBM, Sens]
		The AA has no upland edge (or upland is <1% of perimeter). The AA is entirely surrounded by (& contiguous with) other wetlands or water	. 0	,,
		1-25% of the AA's perimeter abuts upland (including filled areas). The rest adjoins other wetlands or water that is mostly wider than the AA	0	
		25-50% of the AA's perimeter abuts upland. The rest adjoins other wetlands or water that is mostly wider than the AA.	0	
		50-75% of the AA's perimeter abuts upland. The rest adjoins other wetlands or water that is mostly wider than the AA.	0	
		More than 75% of the AA's perimeter abuts upland. Any remainder adjoins other wetlands or water that is mostly wider than the AA.This will be true for most assessments done with WESP-AC.	1	
OF17	Flood Damage from Non-			In the GeoNB map viewer: click on "More" in upper right, then "Flood Information". Expand the menu
	tidal Waters	Maps show Flood Zone or Flood Risk areas and there appears to be infrastructure vulnerable to river flooding not caused by tidal storm surges.	0	under it by clicking on the arrow to its left and the slider to its right. Uncheck the first (Limits of Data) box. Where available, LiDAR imagery can provide finer elevational resolution useful for flood
		Maps show Flood Zone or Flood Risk areas, but infrastructure is absent or is not vulnerable to floods from a non-tidal river. In some cases evees, upriver dams, or other measures may partly limit damage or risk from smaller events.	0	modeling. [WSv]
		Maps do not show Flood Zone or Flood Risk areas (or no such mapping has been done locally) and there appears to be infrastructure vulnerable to river flooding unrelated to tidal storm surges.	0	
OF18	Relative Elevation in	Maps do not show Flood Zone or Flood Risk areas (or no such mapping has been done locally) and there ino infrastructure vulnerable to river flooding unrelated to tidal storm surges. In Google Earth, enable the Terrain layer (lower left menu) and open the NB_Watersheds KMZ file that accompanies this calculator. Then	-	[FA, NR, Sens, SFSv, WCv, WSv]
	Watershed	determine the AA's approximate elevation (bottom right, NOT the "eye alt"). Then move cursor around to determine the watershed's maximum and minimum elevation. Divide the AA's elevation by the (max-min).	0.16	
DF19	Water Quality Sensitive Watershed or Area	In Google Earth, open the KMZ file NB_Watershed Protected Area which accompanies this calculator. The AA is within such an area. Enter 1 = yes, 0 = no.	0	If an ACCDC report is available for this AA, it also may contain such information. [NRv]
OF20	Degraded Water Upstream	Sampling indicates a problem with concentrations ofmetals, hydrocarbons, nutrients, or other substances (excluding bacteria, acidic water, high temperatures) being present at levels harmful to aquatic life or humans, and:		May use existing data, or sample those waters as part of this wetland assessment. "Harmful" should be evaluated with regard to current federal or provincial water quality standards. [AM, FA, FR, NRv,
		The condition is present within the AA.	0	PRv, SRv, STR, WBF, WBN]
		The condition is present in waters within 1 km that flowinto the AA, but has not been documented in the AA itself.	0	
		Sampling during both low water periods and times with high runoff (storms, snowmelt) indicates no problems in either the AA or inflowing	0	
		Walters. Data are insufficient (no or inadequate campling within 1 km, or condition exists only at > 1 km unchroam/This is the cituation for nearly.	1	
		Data are insufficient (no or inadequate sampling within 1 km, or condition exists only at >1 km upstream)This is the situation for nearly all wetlands in this region.		
OF21	Degraded Water	The problem described above is downslope from the AA, and:		May use existing data, or monitor waters as part of this wetland assessment. [NRv, PRv, SRv]
	Downstream	The condition is present within 1 km downslope and connected to the AA by a channel.	0	
		The condition is present within 5 km downslope and connected to the AA by a channel, or within 1 km but not connected to the AA by a	0	1
		channel. Sampling during both low water periods and times with high runoff (storms, snowmelt) indicates no problems in either the AA or inflowing	0	
		waters. Data are insufficient (no or inadequate sampling within 1 km, or condition exists only at >1 km upstream)This is the situation for nearly all wetlands in this region.	1	
OF22	Wetland as a % of Its Contributing Area (Catchment)	From a topographic map and field observations, estimate the approximate boundaries of the catchment (CA) of the entire wetland of which the AA may be only a part. Then adjust those boundaries if necessary based on your field observations of the surrounding terrain, and/or busing procedures described in the Manual. Divide the area of the wetland (not just the AA) by the approximate area of its catchment excluding the area of the wetland itself. When doing the calculation, if ponded water is adjacent to the wetland, include that in the wetland area. The result is:		Topographic maps may be viewed online at the National Atlas of Canada (Toporama): http://atlas.gc.ca/toporama/en/index.html [NR, PR, Sens, SR, WS]
		<0.01, or catchment size unknown due to stormwater pipes that collect water from an indeterminate area.	0

Form F (Field). Non-tidal Wetland Data Form. WESP-AC version 2 for New Brunswick wetlands only. DIRECTIONS: Walk for no less than 10 minutes from the wetland edge towards its core, in the part of the AA that is proposed for alteration. If no alteration is proposed, walk in a portion that appears to be most representative of the wetland overall. Walk only where it is safe and legal to do so. Conduct the assessment only after reading the accompanying Manual and the Explanations column of the data form. In the Data column, change the 0 (false) to a 1 (true) for the best choice, or for multiple choices where allowed and so indicated. Answer these questions primarily based on your onsite observations and interpretations. Do not write in shaded parts of this data form. Answering some questions accurately may require conferring with the landowner or other knowledgable persons and/or reviewing aerial imagery. For most wetlands, completing this field data form will require 1-2 hours on a site. For a list of functions to which each question pertains, see the accompanying Interpretations form. For detailed descriptions of each WESP-AC model, see Appendix B of the accompanying Manual. Codes for functions and values are: WS= Water Storage & Delay, SFS= Stream Flow Support, WC= Water Cooling, SR= Sediment Retention & Stabilisation, PR= Phosphorus Retention, NR= Nitrate Removal, CS= Carbon Sequestration, OE= Organic Nutrient Export, INV= Invertebrate Habitat, FA= Anadromous Fish Habitat, FR= Resident Fish Habitat, AM= Amphibian & Reptile Habitat, WBF= Feeding Waterbird Habitat, WBN= Nesting Waterbird Habitat, SBM= Songbird, Raptor, & Mammal Habitat, POL= Pollinator Habitat, PH= Native Plant Habitat, PU= Public Use & Recognition, EC= Ecological Condition, Sen= Wetland Sensitivity, STR= Stressors.

	to all to	Constitute of the	D. I	Deficition In 1
#	Indicators	Condition Choices	Data	Definitions/Explanations
1	Wetland Type	3		Ericaceous shrubs are ones in the heather family (Ericaceae). Most have leathery evergreen leaves. They include rhododendron, azalea, swamp laurel, leatherleaf, Labrador tea, and others. Most require
		A. Moss and/or lichen cover more than 25% of the ground. Often dominated by ericaceous shrubs (e.g., Labrador tea) or other acid-tolerant plants (e.g., bog cranberry, pitcher plant, sundew, orchids). Substrate is mostly undecomposed peat. Choose between A1 and A2 and mark the choice with a 1 in their adjoining column. Otherwise go to 8 below.		acidic soil. Although not in the family Ericaceae, sweetgale (<i>Myrica gale</i>) should be counted also. [AM, CS, FA, FR, INV, NR, OE, PH, Sens, SFS, WBF, WBN]
		A1. Surface water is usually absent or, if present, pH is typically <4.5 and conductivity is usually <100 µSicm (<64 ppm TDS). Trees are absent or nearly so. Sedge cover usually sparse or absent but cottongrass and/or lichen cover may be extensive, as well as cloudberry, lingonberry, sheep laurel, and a sedge (Carex rarillora). Wetland surface and surrounding landscape are seldom sloping and wetland often is domed (convex). Inlet and outlet channels are usually absent. If known, pH of peat is <4.0.	0	
		A2. Not A1. Surface water, if present, has pH typically >4.5 and conductivity is usually >100 µS/cm (>64 ppm TDS). Sedge cover is usually extensive, and/or tree and fall shrub cover is extensive. Sometimes at toe of slope or edge of water body. An exit channel is usually present. Wetter than A1 and peat depth may be shallower (<2 m).	0	
		B. Moss and/or lichen cover less than 25% of the ground. Soil is mineral or decomposed organic (muck). Choose between B1 and B2 and mark the choice with a 1 in their adjoining column:		
		B1. Trees and shrubs taller than 1 m comprise more than 25% of the vegetated cover. Surface water is mostly absent or inundates the vegetation only seasonally (e.g., vernal pools or floodplain).	1	
		B2. Not B1. Tree & tall shrubs comprise less than than 25% of the vegetated cover. Vegetation is mostly herbaceous, e.g., cattail, bulrush, burreed, pond lily, horsetail. Surface water may be extensive and fluctuates seasonally, being either persistent or drying up partly or entirely.	0	
AA sh ncludi a dja lescri	minder: For all questions, the AA should include all persistent waters in ponds smaller than 8 hectares (-283 m on a side) that are adjacent to the AA. The should also include part of the water area of adjacent ponded water larger than 8 ha and adjacent rivers wider than 20 m. Specifically, the AA should ude the open water part adjacent to wetland vegetation and equal in width to the average width of that vegetated zone. Throughout this data form, glacent "is used synonymously with abutting, adjoining, bordering, contiguous and means no upland (manmade or natural) completely separates the cribed features along their directly shared edge. Features joined only by a channel are not necessarily considered to be adjacent a large portion of their test match. The features do not have to be hydrologically connected in order to be considered adjacent.			
2	Wetland Types - Adjoining or Subordinate	If the AA is smaller than 1 ha, mark all other types that occupy more than 1% of the vegetated AA. If the AA is larger than 1 ha, mark all other types which are within or adjacent to the AA and occupy more than 1 ha, as visible from the AA or as interpreted from aerial imagery. Do not mark again the type marked in F1.		1 hectare is 10,000 sq. m or about 2.5 acres. It could have dimensions of 100 m by 100 m, 1000 m by 10 m, or similar. [AM, INV, SBM, WBF]
		A1. A2.	0	
		B1.	0	
		B2.	1	
3	Woody Height & Form Diversity	Following EACH row below, indicate with a number code the percentage of the living vegetation in the AA which is occupied by that feature (6 if >95%, 5 if 75-95%, 4 if 50-75%, 3 if 25-50%, 2 if 5-25%, 1 if <5%, 0 if none). If the vegetated part of the AA is largely herbaceous (non-woody) vegetation, these percentages should not sum to 100%.		Deciduous shrubs in this region usually include buttonbush, Labrador tea, bayberry (Morella), huckleberry, cranberry, cloudberry, sweetgale, alder, willow, birch, ash, dogwood, and a few others. If you assigned a code of 3 or higher to any of the first four choices and the ground cover beneath the trees/shrubs is <25% moss, then question F1 might be "B1". [CS, NV, NR, PH, POL, SBM, Sens]
		coniferous trees (may include tamarack) taller than 3 m. deciduous trees taller than 3 m.	5	• • • • • • • • • • • • • • • • • • • •
		coniferous or ericaceous shrubs or trees 1-3 m tall not directly below the canopy of trees.	3	
		deciduous shrubs or trees 1-3 m tall not directly below the canopy of trees. coniferous or ericaceous shrubs <1 m tall not directly below the canopy of taller vegetation.	2	
		deciduous shrubs or trees <1 m tall (e.g., deciduous seedlings) not directly below the canopy of taller vegetation.	1	
lote :	If none of top 4 rows in	F3 was marked 2 or greater , SKIP to F9 (N fixers).		
4	Dominance of Most	Determine which two woody plant species comprise the greatest portion of the low (<3 m) woody cover . Then choose one:		[PH, POL, SBM, Sens]
	Abundant Shrub Species	those species together comprise > 50% of such cover.	1	
5	Woody Diameter Classes	those species together do not comprise > 50% of such cover. Mark ALL the types that comprise >5% of the woody canopy cover in the AA or >5% of the wooded areas (if any) along its upland edge	0	Estimate the diameters at chest height. If small-diameter trees are overtopped (shaded) by larger
		(perimeter). The edge should include only the trees whose canopies extend into the AA.		ones, visualise a "subcanopy" at the average height of the smaller-dbh trees, to serve as a basis for t minimum 5% canopy requirement in this question. The trees and shrubs need not be wetland species

F37	Interspersion of	During most of the part of the growing season when water is present, the spatial pattern of emergent vegetation within the water is mostly:		[AM, FA, FR, INV, NR, OE, PH, PR, SBM, SR, WBF, WBN]
	Emergents & Open Water	Scattered. More than 30% of such vegetation forms small islands or corridors surrounded by water.	0	
	water	Intermediate.	0	
		Clumped. More than 70% of such vegetation is in bands along the wetland perimeter or is clumped at one or a few sides of the surface water area.	0	
F38	Persistent Deepwater	If the deepest patch of surface water (flowing or ponded) in or directly adjacent to the AA is mostly deeper than 0.5 m for >2 weeks during the growing season, enter "1" and continue. If not, enter "0" and SKIP to F42 (Connection).	0	
F39	Area Non-vegetated Aquatic	During most of the growing season and in waters deeper than 0.5 m, the cover for fish, aquatic invertebrates, and/or amphibians that is		For this question, consider only the wood that is at or above the water surface. Estimates of underwater
	Cover	provided NOT by living vegetation, but by accumulations of dead wood and undercut banks is:	0	wood based only on observations from terrestrial viewpoints are unreliable so should not be attempted. [AM, FA, FR, INV]
		Little or none. Intermediate.	0	[
F40	Incluted Island	Extensive. The AA contains (or is part of) an island or beaver lodge within a lake, pond, or river, and is isolated from the shore by water depths > 1 m on	0	[WBN]
F4U	Isolated Island	all sides during an average June. The island may be solid, or it may be a floating vegetation mat that is sufficiently large and dense to support a waterbird nest.	Ü	
F41	Duckweed	At some time of the year, mats of algae and/or duckweed are likely to cover >50% of the AA's otherwise-unshaded water surface, or blanket >50% of the underwater substrate. If true, enter "1" in next column. If untrue or uncertain, enter "0".	0	[EC, PR, WBF]
F42	Channel Connection & Outflow Duration	The most persistent surface water connection (outlet channel or pipe, dilch, or overbank water exchange) between the AA and a downslope stream network is; [Note: If the AA represents only part of a wetland, answer this according to whichever is the least permanent surface connection: the one between the AA and the rest of the wetland, or the surface connection between the wetland and the downslope stream network.] Persistent (surface water flows out for >9 months/year).	0	Consider the connection regardless of whether the surface water is frozen. The "downslope stream network" could consist of ditches, rivers, ponds, or lakes which eventually connect to the ocean. If this cannot be determined while visiting the AA, consult topographic maps perhaps by viewing these online with Toporama (http://atlas.nrcan.gc.ca/toporama/en/index.html) [CS, FA, FR, NR, OE, PR, Sens, SFS SR, WCv, WS]
		Seasonal (surface water flows out for 14 days to 9 months/year, not necessarily consecutive).	0	
		Temporary (surface water flows out for <14 days, not necessarily consecutive). None but maps show a stream network downslope from the AA and within a distance that is less than the AA's length. SKIP to F47 (pH	0	
		Measurement). No surface water flows out of the wetland except possibly during extreme events (-once per 10 years). Or, water flows only into a wetland,	1	
E42	Outflow Confin	ditch, or lake that lacks an outlet. SKIP to F47 (pH Measurement).	1	*Moior moff overlet would include his self-lish materials in the self-lish
F43	Outflow Confinement	During major runoff events, in the places where surface water exits the AA or connected waters nearby, the water: Mostly passes through a pipe, culvert, narrowly breached dike, berm, beaver dam, or other partial obstruction (other than natural topography)	0	"Major runoff events" would include biennial high water caused by storms and/or rapid snowmelt. [CS, NR, OE, PR, Sens, SR, STR, WS]
		that does not appear to drain the wetland artificially during most of the growing season.		
		Leaves through natural exits (channels or diffuse outflow), not mainly through artificial or temporary features. Is exported more quickly than usual due to ditches or pipes within the AA or connected to its outlet, or within 10 m of the AA's edge, which drain the wetland artificially, or water is pumped out of the AA.	0	
F44	Tributary Channel	At least once annually, surface water from a tributary channel that is >100 m long moves into the AA. Or, surface water from a larger permanent water body adjacent to the AA spills into the AA. If it enters only via a pipe, that pipe must be fed by a mapped stream or lake further upslope. If no, SKIP to F47 (pH Measurement).	0	If inlet tributaries cannot be searched for due to inaccessibility of part of the AA, follow suggestions in F42 above. [NRv, PH, PRv, SRv]
F45	Input Water Temperature	Based on lack of shade, water source characteristics, or actual temperature measurements, the inflow is likely to be warmer than surface water in the AA during part of most years. Enter 1= yes, 0= no.	0	[wcv]
F46	Throughflow	During its travel through the AA at the time of peak annual flow, water arriving in channels: [select only the ONE encountered by most of the		[FA, FR, INV, NR, OE, PR, SR, WS]
	Resistance	Incoming water]. Does not bump into many plant stems as it travels through the AA. Nearly all the water continues to travel in unvegetated (often incised)	0	
		channels that have minimal contact with wetland vegetation, or through a zone of open water such as an instream pond or lake.		
		Bumps into herbaceous vegetation but mostly remains in fairly straight channels. Bumps into herbaceous vegetation but mostly remains in fairly straight channels.	0	
		Bumps into herbaceous vegetation and mostly spreads throughout, or is in widely meandering, multi-branched, or braided channels.	0	
		Bumps into tree trunks and/or shrub stems but mostly remains in fairty straight channels. Bumps into tree trunks and/or shrub stems and follows a fairty indirect path from entrance to exit (meandering, multi-branched, or braided).	0	
F47	pH Measurement	The pH in most of the AA's surface water:		Preferably, measure this in larger areas of ponded surface water within the AA, or in streams that have passed through (not along) most of the AA. Unless surface water is completely absent, do not dig holes
		Was measured, and is: [enter the reading in the column to the right.] Was not measured but surface water is present and is darkly tea-coloured. Or if no surface water, then mosses and plants that indicate	0	or make depressions in peat in order to provide water for this measurement. Avoid measuring near
		peatland (e.g., Labrador tea) are prevalent. Enter "1".		roads or in puddles formed only by recent rain. [AM, FA, FR, NR, WBF, PH, PR, Sens, WBF, WBN]
F48	TDS and/or	Neither of above. Enter *1". The TDS (total dissolved solids) or conductivity off the AA's surface water is: (select the first true row with information):	1	See above for measurement guidance. [FR, INV, NRv, PH, PRv, Sens]
	Conductivity	TDS is: [Enter the reading in ppm or mg/L in the column to the right, if measured, or answer next row.]		
		Conductivity is [Enter the reading in \(\mu \)S\(\mu \)m in the column to the right.] Was not measured, but plants that indicate saline conditions cover much of the vegetated AA. Enter *1*.	0	
		Neither of above	1	
F49	Beaver Probability	Use of the AA by beaver during the past 5 years is (select most applicable ONE):		[FA, FR, PH, SBM, Sens, WBF, WBN]
		Evident from direct observation or presence of gnawed limbs, dams, tracks, dens, lodges, or extensive stands of water-killed trees (snags).	0	
		Likely based on known occurrence in the region and proximity to suitable habitat, which may include: (a) a persistent freshwater wetland, pond, or lake, or a perennial low or mid-gradient (<10%) channel, and (b) a corridor or multiple stands of hardwood trees and shrubs in vegetated areas near surface water.	0	
F50	Groundwater Strength	Unlikely because site characteristics above are deficient, and/or this is a settled area or other area where beaver are routinely removed. Select first applicable choice:	1	Adhere to these criteria strictly do not use personal judgment based on fen conditions, pH, or other
1.00	of Evidence	Select first applicable choice: Springs are known to be present within the AA, or if groundwater levels have been monitored, that has demonstrated that groundwater primarily discharges to the wetland for longer periods during the year than periods when the wetland recharges the groundwater.	0	Anoner to tinese criteria stricity - oo not use personal judgment assed on ren conditions, pH, or other evidence. Consult lopographic maps to detect breaks in slope described here. Rust deposits associated with groundwater seeps may be most noticeable as orange discoloration in ice formations along streams during early winter. [AM, CS, FA, FR, INV, NR, OE, PH, PRV, SFS, WC, WS]
		Most of the AA has a slope of >5%, or is very close to the base of a natural slope longer than 100 and much steeper than the slope of the AA, AND the pH of surface water, if known, is >5.5.	0	, , , , , , , , , , , , , , , ,
F51	Internal Gradient	Neither of above is true, although some groundwater may discharge to or flow through the AA. Or groundwater influx is unknown. The gradient along most of the flow path within the AA is:	1	This is not the same as the shoreline slope. It is the elevational difference between the AA's inlet and
101	internal Gradient	The gradient along most of the now pain within the AA is: <2% or the AA has no surface water outlet (not even seasonally).	1	outlet, divided by the flow-distance between them and converted to percent. If available, use a
		2-5%.	0	clinometer to measure this. Free clinometer apps can be downloaded to smartphones. If the wetland is large (longer than ~1 km), this may be estimated using Google Earth to determine the minimum and
		6-10%. >10%.	0	maximum elevation within the AA, then dividing by length and multiplying by 100. [CS, NR, OE, PR, SR, WBF, WBN, WS]
		ions: If the AA lacks an upland edge, evaluate based on the AA's entire perimeter, and moving outward into whatever areas are	Ü	and the second s
adjace F52		nese questions are best answered by measuring from aerial images. Within a zone extending 30 m laterally from the AA's edge with upland and/or other wetlands, the percentage that contains perennial		[AM, FA, FR, INV, NRv, PH, POL, PRv, SBM, Sens, SRv, STR, WBN]
	of Perimeter	vegetation cover (except lawns, row crops, heavily grazed land, conifer plantations) is:		• · · · · · · · · · · · · · · · · · · ·
		<5%. 5 to 30%.	0

53	Type of Cover in Buffer	Within 30 m upslope of where the wetland transitions to upland, the upland land cover that is NOT perennial vegetation is mostly (mark ONE):		[AM, FA, INV, NRv, PH, POL, SBM, STR, WBN]
	Type or cover at Banci	, , , , , , , , , , , , , , , , , , , ,		
		Impervious surface, e.g., paved road, parking lot, building, exposed rock.	0	
		Bare or nearly bare pervious surface or managed vegetation, e.g., lawn, row crops, unpaved road, dike, landslide.	0	
54	Buffer Slope	The steepest and/or most disturbed part of the upland area that is within 30 m of the wetland and occupies >10% of that upland area has a percent slope of:		[NRv, PRv, Sens, SRv]
		<1% (flat almost no noticeable slope) or all the area within 30 m of the AA edge is other wetlands. 2-5%.	0	
		5-30%.	0	-
		3-30%. >30%.	0	-
55	Cliffs or Steep Banks	In the AA or within 100 m, there are elevated terrestrial features such as cliffs, talus slopes, stream banks, or excavated pits (but not riprap)	0	Do not include upturned trees as potential den sites. [POL, SBM]
33	Ciliis of Steep Banks	that extend at least 2 m nearly vertically, are unvegetated, and potentially contain crevices or other substrate suitable for nesting or den areas. Enter 1 (yes) or 0 (no).		portion mende dynamica arees as potential activistics. It OE, Solmj
56	New or Expanded Wetland	Human actions within or adjacent to the AA have persistently expanded a naturally occurring wetland or created a wetland where there previously was none (e.g., by excavation, impoundment):		Determine this using historical aerial photography, old maps, soil maps, or permit files as available [CS NR, OE, PH, Sens]
		No.	0	
		Yes, and created or expanded 20 - 100 years ago.	0	
		Yes, and created or expanded 3-20 years ago.	0	
		Yes, and created or expanded within last 3 years.	0	
		Yes, but time of origin or expansion unknown.	0	
		Unknown if new or expanded within 20 years or not.	1	
57	Burn History	More than 1% of the AA's previously vegetated area:		Look for charred soil or stumps (in multiple widely-spaced locations) or ask landowner. [CS, PH, STR]
		Burned within past 5 years.	0	-
		Burned 6-10 years ago.	0	-
		Burned 11-30 years ago.	0	
F0.	V (1-11-11)	Burned >30 years ago, or no evidence of a burn and no data.	1	[DL CTD WDF.]
58	Visibility	The maximum percentage of the wetland that is visible from the best vantage point on public roads, public parking lots, public buildings, or public maintained trails that intersect, adjoin, or are within 100 m of the AA (select one) is:		[PU, STR, WBFv]
		<25%.	0	
		25-50%.	0	
F0	NI	>50%.	1	[DLI CTD]
59	Non-consumptive Uses - Actual or	Assuming access permission was granted, select ALL statements that are true of the AA as it currently exists:		[PU, STR]
	Potential	For an average person, walking is physically possible <u>in</u> (not just near) >5% of the AA during most of the growing season, e.g., free of deep water and dense shrub thickets.	1	
		Maintained roads, parking areas, or foot-trails are within 10 m of the AA, or the AA can be accessed part of the year by boats arriving via contiguous waters.	1	
		Within or near the AA, there is an interpretive center, trails with interpretive signs or brochures, and/or regular guided interpretive tours.	0	
60	Unvisited Core Area	The percentage of the AA almost never visited by humans during an average growing season probably comprises: [Nate: Only include the part actually walked or driven (not simply viewed from) with a vehicle or boat. Do not include visitors on trails outside of the AA unless more than half the welland is visible from the trails and they are within 30 m of the weltand edge. In that case include only the area occupied by the		[AM, FAv, FRv, PH, PU, SBM, STR, WBF, WBN]
		trail.]		
		<5% and no inhabited building is within 100 m of the AA.	0	
		<5% and inhabited building is within 100 m of the AA.	0	
		5-50% and no inhabited building is within 100 m of the AA.	1	
		5-50% and inhabited building is within 100 m of the AA.	0	-
		50-95%, with or without inhabited building nearby.	0	
61	Eroguanthy Violtad	>95% of the AA with or without inhabited building nearby.	0	TAM DIL DIL COM CTD MIDE MIDNI
01	Frequently Visited Area	The part of the AA visited by humans almost daily for several weeks during an average growing season probably comprises: [See note above.]		[AM, PH, PU, SBM, STR, WBF, WBN]
		<5%. If F60 was answered ">95%" (mostly never visited), SKIP to F64.	0	
		5-50%.	1	
		50-95%.	0	-
62	BMP - Soils	>95% of the AA. Boardwalks, paved trails, fences or other infrastructure and/or well-enforced regulations appear to effectively prevent visitors from walking on soil within nearly all of the AA when the soil is unfrozen. Enter "1" if true.	0	[PH, PU]
63	BMP - Wildlife Protection	Fences, observation blinds, platforms, paved traits, exclusion periods, and/or well-enforced prohibitions on motorised boats, off-leash pets, and off road vehicles appear to effectively exclude or divert visitors and their pets from the AA at critical times in order to minimize disturbance of wildlife (except during hunting seasons). Enter *1* if true.	0	[AM, PU, WBF, WBN]
64	Consumptive Uses	Recent evidence was found within the AA of the following potentially-sustainable consumptive uses. Select ALL that apply.		[FAv, FRv, WBFv]
	(Provisioning Services)	Low-impact commercial timber harvest (e.g., selective thinning).	0	
		Low-impact commercial umber narvest (e.g., selective minning). Commercial or traditional-use harvesting of native plants, their fruits, or mushrooms.	0	1
		Waterfowl hunting.	0	1
		Fishing.	0	1
		Trapping of furbearers.	0	1
		None of the above.	1	1
65	Domestic Wells	The closest wells or water bodies that currently provide drinking water are:		[NRv]
		Within 0-100 m. of the AA.	0	
		100-500 m. away.	0	
		>500 m. away, or no information.	1	
66	Calcareous Fen	The AA is, or is part of, a calcareous fen. See the Plants. Calcar worksheet in the accompanying Supplinfo file for list of plant indicators	0	[PH, PR]
